He lay thus, quite still, on his back, with wide-open eyes, when he was electrified by the same voice saying close to his ear: 'Go to Lincoln—at once!'

'I will,' answered the Major aloud; and springing up, he lighted the tapers on the toilet table and began to dress. Consulting his watch, he found it was four o'clock in the morning; and looking from the window which gave a view over the park, he saw a clear starlit sky and a white frost on the grass. Writing a short note of explanation to his brother-in-law, Sir Philip, he placed it on the outside handle of his door, in order that it might be seen by the servants at an early hour.

'He will think I am cracked; I hope I am not, for really I am going to Lincoln without knowing why,' he soliloquised as he noiselessly descended the broad staircase. The Hall door was so barricaded by its manifold fastenings of bars, bolts, and chains, that he could not undo them without alarming the household; he therefore entered a conservatory opening from the drawing-room, and unlocking a glass door, let himself out into the park, traversing it without encountering a keeper, but disturbing the deer clustered together under the bare branches of the fine elms and beeches, who started up from their lair, gazing at him in wonder.

Major Randall rather enjoyed his tramp to Worcester in the bracing air of a fine frosty morning. He reached the station in time to take a cup of coffee and a sandwich before starting by the six o'clock train. Being an experienced traveller, he arranged his long journey so well, that, changing at one junction in order to catch the express at another, he was enabled to reach Lincoln by two o'clock. After enjoying a luncheon, he strolled through the hilly street of that interesting old city.

'Why am I here, I wonder?' he kept repeating to himself. 'Shall I have further orders?'

But though he listened attentively, no voice spoke again. He surveyed the exterior of the fine cathedral, and looked in the shop windows, wandering without any definite object. The town was unusually full of people, who seemed in a state of excitement. The winter assizes were on. Not knowing how to occupy his time, he stepped into the courthouse, where a trial was taking place. The entrance was blocked with people.

'What case is on?' he inquired of a policeman.

'A young man is being tried for his life, sir—it's a murder.'

'Of whom?'

'Mr Twyford, the miller at Roby, as was shot on the road between Merstoke and his house—pore old gentleman.'

Major Randall recalled the sad affair that had happened the night of his arrival at the Miss Ingestres': in his succession of visits and amusements it had escaped his memory.

'I will go in, if you can get me a place,' said he, slipping silver into the policeman's hand. This talisman and his fine military appearance gained him an admission which had been refused to many others. Through some private interest he possessed, the officer succeeded in not only introducing him into the body of the court but procuring him a good seat.

The interior was densely packed, and its heat was great, for the trial had lasted some hours. The accused was a young man of about four-and-twenty years of age, tall, fair, and handsome, but pale and worn by anxiety. The Major was sorry that he had not heard the case from its commencement; but from what he gleaned, the evidence was fearfully against the prisoner at the bar. To state it briefly: William Armstrong had been four years in Isaac Twyford's employment as foreman at the mill, when he was offered a higher salary and a house to live in by a corn-factor at Boston. The old miller was unwilling to part with him, and offered to raise his wages to those proposed by the corn-dealer; but young Armstrong declined. The chance of a house rent-free was a great inducement for the change, as it would enable him to marry a young girl to whom he was engaged. Unfortunately, his master did not take the refusal in good part, and thought him too young to get married. High words had followed, and a quarrel ensued.

Mr Twyford was well known and respected as a just man by all the country round; but it was also acknowledged that he was a severe one; still, he was not supposed to have any enemies; yet, within a week of his disagreement with Armstrong, he was shot dead on the high-road leading from Merstoke to Grantham, beside which his mill was situated. He had been the best part of the day at Merstoke transacting business, but had unexpectedly been detained until late; indeed, it was nearly half-past six when he quitted the Crown Inn on his starting for home.

Many persons had heard the old man call his foreman hard names—ungrateful, time-server, and such-like—and had seen Armstrong leave the mill in anger. Other witnesses from Boston deposed that he possessed pistols and a fowling-piece, which he had been cleaning and using recently. Some had met him at ten o'clock on the night of the murder, looking wet and fagged. Mr Twyford's housekeeper stated that in the afternoon of that day Armstrong had come over from Boston saying he particularly wished to see her master and apologise to him for the hasty words he had used; it pained him to be at variance with the old miller, who had formerly treated him with kindness. He appeared disappointed when she told him that Mr Twyford had gone to Merstoke for the day, making many inquiries as to the time of his return, also saying he had half a mind to go and meet him; whether he did so or not she could not say. Soon after he left, it began to rain.

Another witness was the carrier, who met him, and exchanged a few words on the Merstoke road; it was then raining fast.

The prisoner had pleaded not guilty. What the witnesses had stated was correct. Upon hearing that the miller had ridden over to Merstoke, he started to meet him; but the rain fell so fast, he turned back. Unfortunately, he missed the train, and was obliged to walk the whole distance to Boston, where he arrived greatly fatigued and very wet. It was a great shock to him when he was arrested the following day, charged with the murder of his former employer.

It was seven o'clock when Mr Twyford was shot; the woman at the roadside cottage stated that her timepiece struck that hour just before she heard the report of the pistol.

'I am innocent,' the prisoner said solemnly. 'Appearances are fearfully against me; but I would never raise my hand against Mr Twyford. We were not on good terms; still, there was no malice on either side. I was not near Merstoke high-road at the time of the murder, but in a directly opposite direction, seven miles away from it, going home. There is one person, the only one in the world, who could prove it. Who he is, I do not know. I overtook him on the way. It was pitch dark; the rain came down in torrents, and we took shelter for a time in the porch of Bertoft old church, and exchanged a few words. Of course we could not see each other. That stranger could testify the fact of my presence there—though perhaps he has forgotten it.'

'No; he has not,' rang out Major Randall's clear voice. 'He is here.'

In the midst of great excitement, the Major pushed his way through the crowd to the witness-box. He now saw *why* he had been sent to Lincoln.

Thus, at the eleventh hour, William Armstrong's character was vindicated to the world, his statement fully corroborated by a witness of irreproachable integrity. Clearly and circumstantially the Major related how he was walking from the small station to Cressing Hall, and had been overtaken by a fellow-pedestrian, seeking shelter with him for a short time in the old church porch—the clock striking seven while there; also the conversation they had held together in the dark—of how the prisoner's grandfather had during a flood rowed in a boat to make his purchases at the village shop, and shot wild-ducks in the fields of Bertoft—facts which a stranger could not possibly have known.

William Armstrong was discharged, and a reward of a hundred pounds at once offered for the apprehension of the actual murderer.

Sir Philip and Lady Hartbury were quite prepared to quiz their brother unmercifully on his wildgoose chase, when he returned; but when they heard its result, speedily changed their intention, listening almost in awe to his recital.

Major Randall never heard the voice again, and declares, in spite of the general opinion to the contrary, that it was *not* a dream.

To do Mrs Drew justice, she was greatly shocked at her uncle's tragic death and poor Elizabeth's sudden decease, but triumphed in the expectation of inheriting the miller's property, its amount proving greater than expected. She

contemplated removing to a country-house, keeping a pony phaeton and giving garden-parties, to let the county families see she could hold up her head as high as any of them. But behold! when the time came for legal settlement, no certificate of her parents' marriage could be found—no entry in registers. Alas! Mrs Drew was illegitimate.

'Pride must have a fall,' exclaimed the town-folk.

She never again upbraided her husband with having 'no ambition.'

The miller's fortune went to very distant relations, who were advertised for in the papers.

A convict named Ashworth died at Portland. On his death-bed he confessed that he had shot his father-in-law on the road home, having learned from his wife that she was forgiven and would inherit the property. Her sudden death defeated him.

SORTES SACRÆ; OR, DIVINATION BY LOT.

THE practice of consulting certain books in order to discover the future is common to all people who have books more or less sacred. Among the Romans the Sibylline books were kept in a stone coffer under ground in the temple of Jupiter on the Capitol, under the custody of certain officers. They were consulted in the case of prodigies and calamities. The contents having been divulged by one of these men, he was put to death. When the temple in which they were preserved was burnt, 82 B.C., the Sibylline books perished in the fire. Then ambassadors were sent to various towns in Italy, Greece, and Asia Minor to collect any copies of these prophecies that might be preserved there.

A great number of spurious prophetic books circulated, pretending to be Sibylline oracles, and Augustus ordered that they should be collected and burnt. But other works were consulted for the purpose of peering into the future beside the Sibylline books. A favourite volume for such exploration was Virgil. The story is told of Hadrian, in the reign of Trajan, that being concerned as to the mood of the Emperor towards him and his own prospects, he consulted Virgil, and lit on the lines:

Who is he at a distance, with branches of olive
adorned,
And bearing the hallowed vessels? I know the look
of a king,
With locks and beard all hoary, the first to establish
the city
With laws—from a humble village exalted a sovereign
to be.

And when Alexander Severus, as a boy, consulted the same book, his finger rested on the line: 'To thee the empire will come of heaven and earth and the ocean.' The manner of inquiring is for the inquirer to open the book at random and apply the first passage that strikes the eye to the person's own immediate circumstances.

The story is well known of King Charles I. and Lord Falkland inquiring into the future in this manner before the battle of Newbury. The king, being at Oxford, went one day to see the

Bodleian Library, and was shown there, among other volumes, a Virgil, very handsomely bound. Lord Falkland, to divert the king, proposed that they should consult it as to an augury for the future; whereupon the king, opening the book, lit on Dido's imprecation, thus translated by Dryden:

Yet let a race untamed, and haughty foes
His peaceful entrance with dire arms oppose;
Oppressed with numbers in the unequal field,
His men discouraged and himself expelled;
Let him for succour sue from place to place,
Torn from his subjects and his son's embrace.
First let him see his friends in battle slain,
And their untimely fate lament in vain;
And when at length the cruel war shall cease,
On hard conditions may he buy his peace;
Nor let him then enjoy supreme command,
But fall untimely by some hostile hand,
And lie unburied on the barren strand.

It is said that King Charles seemed concerned at this accident, and that Lord Falkland, observing it, would likewise try his own fortune in the same manner. The place he stumbled upon was yet more suited to his destiny than the other had been to that of the king. It ran:

O Pallas! thou hast failed thy plighted word
To fight with caution, not to tempt the sword:
I warned thee, but in vain! for well I knew
What perils youthful ardour would pursue:
That boiling blood would carry thee too far,
Young as thou wert in dangers, raw in war;
O curst essay in arms—disastrous doom—
Prelude of bloody fields and fights to come.

Not long after this, King Charles was beheaded, and Lord Falkland fell in a skirmish he had rashly engaged in.

Such is the story as told by Dr Welwood; but, unfortunately, its authenticity is doubtful, as the same story is told by Aubrey of Prince Charles and the poet Cowley at Paris, just before the trial of the King.

Among the Mohammedans it is not unusual to consult in this manner the Koran and the poet Hafiz; and from an early period it was customary among Christians to employ the Bible for the same purpose. St Augustine mentions this as practised in his time, and hesitates about condemning it, so long as it was not applied to things of this world.

Gregory, Bishop of Tours in the sixth century, tells us what was his practice. He spent several days in fasting and prayer, after which he resorted to the tomb of St Martin, and taking any book of Scripture that lay at hand, he opened it, and accepted the first passage that met his eye as the answer to the query he put.

Another manner of consulting the sacred books for an answer consisted in accepting the first verse of a psalm or Scripture read or sung on entering a church during divine service, as the reply to the question in the mind. According to the Confessions of St Augustine it was this that determined the life of St Anthony. He was in hesitation as to his career, when, entering a church, he heard the deacon read the words: 'Go, sell that thou hast, and give to the poor—and come follow me.'

The practice, however, of consulting Scripture as a book of Fate was generally condemned by the Church. A council at Vannes pronounced against it in 461 A.D. So did one at Agde in 506,

and one at Auxerre in 585. Charles the Great forbade it in his Capitularies, and so did Pope Gregory II. Nevertheless, curiosity as to the future was so strong in men's minds that the custom continued. An odd circumstance is that the cathedral Chapter at Orleans in 1146 appealed to a prognostic of this sort in a supplication addressed by them to Pope Alexander III. against their bishop. At his consecration, when the Gospel was opened above his head, the finger of the deacon rested on the words, 'And he left the linen cloth, and fled from them naked.' This was a token that the bishop, Elias, was to be turned out of his see.

The practice of observing the book when opened over the head of a prelate at his consecration was very common. It was thought that a sure augury could thence be drawn as to what sort of a bishop he would prove.

At the consecration of Athanasius, nominated to the patriarchate of Constantinople, a patriarchate which he stained with his crimes, 'the Bishop of Nicomedia having brought the Gospel,' says the Byzantine historian, 'the congregation prepared to take note of the oracle which would be manifest on the opening of the book, though this oracle is not infallibly true. The Bishop of Nicæa, noticing that he had lighted on the words, "Prepared for the devil and his angels," groaned in the depth of his heart, and putting up his hand to hide the words, turned over the leaves and disclosed the other words, "The birds of the air come and lodge in the branches;" words which seemed to have no connection with the ceremony.'

When Landri, Bishop of Laon, was consecrated, the Gospel for the day gave, 'A sword shall pierce through thine own soul also;' and a few years after he was assassinated. He was succeeded by the Dean of Orleans, at whose consecration the book was opened at a blank page; and, in fact, he died shortly after, without having done anything by which his pontificate could be marked.

In 391, when Evurtius desired to retire from the bishopric of Orleans from extreme old age, he assembled the clergy and bade them elect a successor by writing the names of their candidates on slips of paper and putting them into a box. A little child was enjoined to draw the lot, and the name drawn was Aignan. Evurtius was doubtful whether he were suitable, and advised the consultation of the sacred oracles—the Psalter, the Epistles, and lastly the Gospels. This was done. The Psalter was opened at haphazard, and the text at the head of the page was, 'Blessed is the man whom thou choosest and receivest unto thee: he shall dwell in thy courts.' Then in like manner the Epistles were opened at random, and at the head of the page stood, 'Other foundation can no man lay than is laid.' In like manner the Gospel rendered the text, 'On this rock will I build my church, and the gates of hell shall not prevail against it.' After this, all doubts as to the suitability of Aignan to fill the episcopal throne ceased.

Guibert of Nogent, a writer of the twelfth century, who gives a very curious memoir of his own life, tells a story of himself, which shows that the same practice was in vogue at the installation of an abbot. 'On the day of my entry into the monastery,' he says, 'a monk who had

studied the sacred books desired, I presume, to read my future : at the moment when he was preparing to leave with the procession to meet me, he placed designedly on the altar the book of the Gospels, intending to draw an omen from the direction taken by my eyes towards this or that chapter. Now the book was written, not in pages, but in columns. The monk's eyes rested in the middle of the second column, where he read the following passage, "The light of the body is the eye." Then he bade the deacon who was to present the book to me to take care as soon as he had opened the book before me to note on what part of the pages my eyes rested. The deacon accordingly did so. Whilst he observed with curious eyes the direction taken by my glance, my eyes and spirit together turned neither above nor below, but precisely towards the verse which had been indicated before. The monk, who had sought to form conjectures by this, seeing that my action had accorded without premeditation with his intentions, came to me a few days after and told me what he had done, and how wondrously my first movement had coincided with his own.'

The reader will probably agree with the writer of this article that Guibert and the monk must have been hard put to it to discover any oracle in the words, and with Bruno, Bishop of Segni, in the eleventh century, that the looking for such oracles is 'foolery.'

In 1191, Albert von Löwen was elected Bishop of Liège, and was consecrated in the following year. It was at a time of great discord, for there were two rival bishops claiming the see—the one nominated by the Emperor, and a second Albert. At the consecration, the two bishops who assisted the archbishop opened the Gospel before him, and he read the words, 'Herod had sent forth and laid hold upon John, and bound him in prison.' He hastily turned the page, and read, 'Immediately the king sent an executioner and commanded his head to be brought.' Then the archbishop was troubled, and groaning in spirit, laid hold of Albert and said : 'My son, prepare thy soul for temptation, for thou shalt die the death of a martyr.' And in fact Albert was put to death within a few months of his consecration.

The eleventh chapter of Proverbs, which contains thirty-one verses, is often taken to give token of the character of a life. The manner of consulting it is simple ; it is but to look for the verse answering to the day of the month on which the questioner was born. The answer will be found in most cases to be exceedingly ambiguous. For instance, the present Premier, the Marquis of Salisbury, was born on the 3d of January ; the text for him accordingly will be, 'The integrity of the upright shall guide them : but the perverseness of transgressors shall destroy them ;' which is no doubt appropriate enough from a Unionist point of view. But from the opposite point it would be regarded as most unsuitable. For 'General' Booth, born on the 10th of April, we have : 'When it goeth well with the righteous, the city rejoiceth : and when the wicked perish, there is shouting ;' which is vague enough. Mr Gladstone, the 29th of December, gets, 'He that troubleth his own house shall inherit the wind : and the fool shall be

servant to the wise of heart ;' which is also ambiguous.

A mode of taking the lot by Scripture, still in vogue among ignorant and superstitious people, is to put a key in the book, bind the book with twine so as to hold the key in place, and then suspend the Bible between two fingers under the key handle : to ask the question and see whether the key and book turn on the fingers and drop. This is, of course, entirely due to unconscious muscular action, which makes the book give that response which the interrogator desires.

A sacred book given for one purpose, by the perversity of man is used for another for which it was not intended ; and it is hard to say whether the consultation of the *Sortes Sacre* is most silly or most profane.

DORIS AND I.

BY JOHN E. STAFFORD.

IN TWO CHAPTERS.—CHAP. I.

THERE was evil in front of us, and much aching of hearts and suffering. But the throstle sang in the sycamore tree, and the swallows curved and twittered all about us, and in the rich amber light we could see that all was fair and good ; then our eyes would meet, and we thought not of evil, Doris and I. We spoke little, our hearts being very full and words mere idleness. Doris looked out again to the west, leaning her head against me, and taking my hand as it twined over her shoulder. We were in the orchard by the old green wicket, where a month ago, before the blossoms had burst their bulbs, she had allowed me to tell her an old tale, and had said one word of her own to give it finish. And as the throstle sang his love-song, and the sun sank to his bed behind the hills, I thought of then and now, and my head lowered and I kissed her forehead gently. Then Doris sighed as if a spell was broken. For I had come to tell of my wind-fall ; that I was no longer a poor man ; that instead of waiting for years, we might begin our married life on my return from Canada in three months or so ; and the sudden happiness of the thing had wrapt us round and silenced us both. Now that the first flush of it was over, we remembered the fleeting minutes, and fell to talking. What we said is of no account here ; but so little did we dream of harm, or accident of nature to cross our happiness, that not once did we mention *him*, though we knew he was coming next day, to stay perhaps for some weeks, as sick people do.

Then we said good-bye, and I opened the wicket to pass through ; but seeing the wet in her eyes, lingered a while longer till she was smiling again, when I let her go. But I looked back again every dozen yards or so ; and when I got across the second meadow and stood by the stile before vaulting into the high-road, I could still see the straight white figure among the green, and the waving handkerchief. So I asked God to keep her, and went my way with the rose she had given me. Walking home in the pink twilight, the heaviness at leaving her wore off as I looked into the future and saw what was there, or rather what I pictured in it. For when

love is the warp and fortune the woof, what will not the shuttle of fancy do?

Yesterday, things had been so different. Of all my airy castles, there seemed hardly one left, and I had built a good few. Before I knew Doris, such imaginings had never troubled me; but when I had met her at Winchcomb flower-show, love had touched me with its wand, and all of a sudden the dead wall of my life, like that in Chaucer's Romaunt—for I had read a thing or two in the long winter nights before the old place had been hammered into other hands—seemed all alive with pictures. Everything was lit up; the world seemed a new place, and life had sweeter meanings after I had looked into Doris's eyes and she into mine. And when, after many months, I plucked up courage to ask her heart how it was, and she told me, the future widened out in such a fashion that the sight of it nearly made me light-headed.

Had I known how things were, I should have held my tongue, through shame and hopelessness. But my father never gave a sign that ruin was near upon him; that my comfortable heritage, as I deemed it, was mortgaged to its last rood. The crash came, and then the sale, and then life in a little cottage with a broken-down father and a changed look-out, which perhaps made me over-moody. For sometimes I despaired of ever possessing Doris, or of being able under many years to support her in a way fitting to her upbringing. Everything would be broken off, and it would all be a dead wall again.

It was in some such humour that the notary's letter found me that morning. I had seldom heard of Uncle Ben, and had never seen him. He had in early manhood deeply wronged my father in some way, and his name was rarely mentioned. I handed the letter to father, and he was dumb like myself, his face working strangely between anger and something softer. Then he put it down and said: 'Conscience-money, lad, every penny on it; but it's saved yer from my folly, so tek it, an' thank God for teachin' Ben repentance an' me forgiveness—no easy lesson, when a brother— Well, well, let it lie. Poor Ben!'

No wonder, then, that I saw visions as I walked home in the light of the aftermath. It was nearly dusk when I arrived at the cottage; and as I turned for a last look at the burnished hills, a bat came between me and the light and fluttered mockingly before me. But I kissed my rose and laughed at the flittermouse.

I had lived some twenty-five years in the world without knowing much more of it than what our valley and its neighbourhood had to show; so that what I saw on my long journey to my uncle's Canadian farm made me wonder and marvel, as young people do when they go for the first time beyond the mountains and see what is there. But there is no need to dwell upon that; and, moreover, it doesn't concern the drift of what I am telling you.

Nor need I say much about the farm and personal estate which had come to me by my uncle's will. I found that the latter came to some eighty thousand dollars, chiefly invested in Northern Pacific and other stock; and the former a large tract of prairie-land, with house,

farm-buildings, and every appointment of a first-class property. There was a new railway creeping up, which would double its value in a few years' time; and it was for me to say, after I had seen the place, whether I should let it, or wait, or sell it right out. I wrote the lawyer, saying that for the present I would take it in hand till the corn was safely harvested.

So one thing leads on to another, and we prepare our own destiny without knowing it. But I had looked at things in a practical way and according to my lights; and the notary commended me; and Doris sent a letter along saying: 'Yes, Jack; but don't tarry the thrashing too,' which was only sweetheart-like.

The weeks passed on, and I found plenty to occupy and interest me, as was natural. I let Boss Wilson keep much of his authority—he had been in charge of the farm since the death, and his loquacious company was not disagreeable after I had learned to know him. One day in the town near by I happened upon a Worcester man—one Henshaw—and his clannish good feeling made the place still less lonely. Then every week Doris wrote down her little heart for me to read it, and I sent her an account of mine; and all the while the same sun warmed us, and the same moon set us thinking one of the other when the day was over and our souls skipped out for a game at dreams. She was there and I was here, and soon there would be no there and here, but only one place and we in it.

Thinking to this tune I jumped into the saddle one August morning and rode to the post-office for the usual weekly letter. I always rode over, because the postboy who passed us on his way to the next settlement waited for the second mail at noon. I met Mr Henshaw at the door of the office with two letters and a newspaper in his hands.

'Mornin', Mr Sedley,' said he; 'lot o' letters this mail; let me hold the cob till you come out.'

That was the beginning of it—there was no letter. I rejoined Henshaw, and walked down with him to his store, heavy with disappointment.

'Like to see the paper?' said he, as I was leaving, after ordering some supplies of his man. 'Tain't often I get one; but my brother's hay-ricks 'a bin blazin', an' he's sent the account of it. Arl new hay too, an' on'y part insured. Ain't it a pity?'

I said it was, and looked moodily through the columns for news that might interest me. I only learned that there had been a regatta at Evesham; and that our old doctor at Ranston had sold his practice to a Dr Robson—that was all. But as I rode home I kept muttering that doctor's name, wondering where I had heard it before, till suddenly it came to me, bringing a lot of something else with it.

Why had Doris never mentioned him beyond the postscript in her first letter, weeks ago? I had clean forgotten she had a Cousin Stephen, so little did I heed him; but he was still at Ranston, still perhaps an inmate of her home. Why— Here I dropped the reins, and drew out her last letter, to steady me. I read it through, and the dear words brought kindness back, and I kissed her name at the end, saying some one was a fool.

But the doubt had found entrance, and grew, as cancers do, without our knowing it. For the days went on, and no letter came, no sign, till I grew half-wild at the cruelty of it. I wrote, reproaching her; and another week went and another. At last the letter came. The postboy handed it to me as I stood at the gate—I daresay he wondered why I was always there—and I ripped it open, while my heart pumped fit to break itself. Then the paper dropped from my hands, and I held on to the gate with a singing in my ears, and a sudden weakness in seeing, which darkened the sun and all beneath it. . . .

Doris unfaithful—it wasn't natural. Our souls had grafted, and we were one; we were two streams that had met to turn the same millwheel together; our hearts were bound with ligaments of their own growing; there was no undoing what nature had so willed. Yet there was her handwriting, her own words in good black ink telling white it was a liar.

Then all at once, through the rush and swirl of it, came the thought of the new doctor, and a queer coldness went through me as if I had been turned to clay before my time. The life seemed to go out from me, and I could scarcely move my feet as, half staggering, I went indoors and dropped into a chair. Again I read the note, though every cursed word was burnt in my brain for ever.

'I cannot marry you, dear—it is impossible. I like you—I am fond of you, as I told you in the orchard that evening; but I cannot be your wife—I cannot indeed. Oh, I wish I had told you earlier how things were; it was cruel of me to let you go on loving me without telling you the truth. I was afraid to at last; but now you are away it seems less difficult to say. Forgive me; look elsewhere for a more fitting mate—some one who can fully share your new life with you, and help you as a wife should, with head, heart, and hand—some one who can love you better than

DORIS.'

An hour went by, maybe two, while the hardening went on; while the love died away, and the light and the joy of life dimmed and flickered out, leaving me in darkness with hate and revenge. Then I rose up and looked round at the difference of things; for all seemed altered, and not the same. I moved to my desk, and unlocking a drawer, took out all her letters, and they, too, had altered, and were merely so many pieces of paper, not sacred things to be touched with reverence, like bits of the holy rood. But the breath of lavender from them got at some soft corner in me, making my eyes hot and tightening my throat. For a second or two I paused, looking at the vision that grew out of them, till anger puffed and blew it all away, leaving me with only the bundle of papers. This I wrapped up, along with a dead rose and a lock of yellow hair, and directed to Miss Hanlow, Ranston-in-the-Vale, Worcestershire, England.

'Hère,' said I, as Nita, my uncle's old house-keeper, hobbled in to lay the cloth for tea; 'let one of the lads take this to the dépôt before dark. No matter; I'll take it myself.—Where's Boss?'

'Goin' away?' said Boss Wilson, as I pulled up, half an hour later, at the gate he was mending—'just as the corn's yellowin' for the machines? Summat wrong? You look kinder hit—hope

'tain't serious.' He wiped his face, looking hard at mine, which I turned away, feeling it was a tell-tale.

'You won't be alone long,' I went on. 'My father is on his way, and will take possession of the farm and see to things in my absence. I have asked him to keep you on, Boss, and I think you'll find him a good sort.—Good-bye. See you again some day when I've—when I've found what I want.' I glanced down at his furrowed face and saw kindness in it.

'Lost summat, gaffer?' said he, and I could feel the search of his look. He was a shrewd man, twice my age, and may have noticed many things since we had been together.

'Ay, I've lost something,' I answered; 'but it's not that I'm after, Boss. No use hunting for broken bubbles, I take it.'

'No, 'tain't,' drawled Boss; 'but whatever you're after, it'll tek some findin', I guess, an' you may scour the world up an' down an' find it in yourself when all's done. Have a good knock round, gaffer; an' when it's all burnt out, come back again and mek friends w' things.'

I could see his outstretched hand, and mine went to it involuntarily.

'S'long, gaffer,' was all I heard as the horse leaped away with me down the rough track.

'So long,' I said to the hot silence and the western solitude, where I had dreamed my dreams awhile, tolerant of the summer loneliness as long as I could people it with fancy and see Doris and good company beyond it. But to remain there with my dead hopes all about me, grinning like marionettes which love had made caper, deluded by its own magic; to live on through the long monotonous heat with no opposite shore for the bridge of thought to touch, with no future but a fogbank where had been a fair country. No, I could not.

ON LOOKS.

THERE is probably no subject in the world which excites more interest in the human mind than personal appearance. Whether we are conscious of it or not, it is the centre of the greater portion of our daily thoughts. Look, for instance, at some of the other themes on which thought dwells—Ambition, Anticipation, Anxiety, Charity, or Sympathy. The space of time occupied by any one of these in twenty-four hours cannot equal that which we spend on our toilet, dress, and comportment combined. They claim our attention at the earliest hour of the morning; follow us instinctively through every action of the day; are present at our meetings of social intercourse; haunt our pleasures, not unfrequently mar them; and are probably in some degree the last shadows which veil us from the land of dreams. Considering that it is very important that our minds should not be burdened with what is unworthy, it would be well for us to assure ourselves that the effect this produces is not intended to be prejudicial. At first glance a person may disclaim the imputation, and say: 'Indeed, I think very little of my personal appearance;' or, 'I have no looks to boast of, so it's little time I spend on them.' To each of whom we would reply: 'My friend, you think

more of your personal appearance than you are aware of; and you spend more time on your looks because they are *not* good.'

People who depreciate or pretend to be wholly indifferent to their looks, either act a lie, or else fail to recognise the main structure on which the human mind is built. What, in fact, are looks for? If faces were like blades of grass or leaves of trees, where would be our identity? Where would be our passions? Where would be our motives? The whole world would become a gigantic piece of machinery, worked by the mind of man, without aim, without vitality, without result. It is the human form divine which gives lifeblood to our passage through this world. Emulation, self-respect, improvement, and admiration, are all qualities which spring from the consciousness that outward appearance is, and was intended to be, a matter of first importance. It is as much a law of nature as self-preservation. No matter how handsome or how ugly a man may be—and there is no distinction between man and woman here—let him go arm in arm with a friend towards a mirror. Whose image does he first glance at? Not the friend's, you may be sure. Observe a lady walking along the street. How many times will she glance at her own reflection in the shop windows? As often as she gets the chance. The sight never loses its novelty. That question, 'What am I looking like?' never loses its fascination. Let her go into a room full of mirrors. She will look into one on the right; then immediately turn and repeat the process on the left. She is quite right. The two sides are entirely different. Again, let her see a friend appear in a new dress or fashion. What is the first thought that occurs to her? 'Now I wonder how that would suit me?' She immediately turns over in her mind how and when the idea is to be carried out, while the friend is all the while flattering herself she is an object of admiration.

Let no man or woman condemn themselves for this weakness. It is common to all alike. Neither let them undervalue good looks, nor despair of improving bad ones. The gift of beauty is often allied with a fascination of manner which plain faces may sigh for in vain. If it could be bought for money, what price would not be paid for that peculiar glance or smile which is imprinted for all time!

But while we acknowledge its power and envy its possession, there is much to be said on the opposite side. Those who lack beauty avoid its snares. Those who are passed by, pause to ask themselves how they may turn life to its best account. They have no chance in the world of show. They will not even have honourable mention. They had best not compete. Other fields are open to them, wider and more satisfying than the gift that fades. We are few of us born geniuses; but we venture to say many who come under that head have become known to the world from the simple fact that they were born with a plain face. It is easy to recall instances where even severe bodily affliction has not been an obstacle to a distinguished career. There is, however, one kind of beauty with which no one is born and to which any one may attain, but the means of acquiring it is a secret which each must find out for himself. It is

exceedingly rare and exceedingly beautiful. At least once in our lives we may remember to have seen such a face, generally that of an old man with many lines in it. It arrests the heart as well as the eye. It makes us yearn for something yet unknown, that serenity of countenance which is the index of a saintly soul.

THE GOLDEN THREAD.

A MAIDEN stood in an old-world room,
With the early light on her golden hair,
And said, as she dusted her silent loom :
'The web of my life shall be bright and fair.
I will hasten to choose some silken strands,
And begin my work in the morning hours,
While the dew-beads gleam on the meadow-lands,
And the air is sweet with the breath of flowers.'

So she wove together each slender thread
Till the web grew broad and the web grew strong,
While high in an elm-tree overhead
A blackbird warbled his matin song.
But noontide smiled on the hill's green slope
Ere she said with a sigh of soft regret :
'I have finished my threads of faith and hope,
And the hues of my web are sombre yet !'

Then, over the bridge where the runnel flowed,
And under the shade of the leafy lane,
In brodered doublet a stranger rode,
With something bright at his bridle-rein,
Who bent her unfinished work above
To say in a whisper : 'Maiden sweet,
You need but this golden thread of love
To make the web of your life complete.'

Did the woof break off with a sudden jerk
As the gleaming shuttle was swiftly thrown ?
For the maiden found it was weary work
Weaving Life's intricate web alone.
And the stranger saw that her face was fair,
And spoke of the road and the scorching sun,
And owned 'twould be pleasant her task to share
By the rose-screened pane till the day was done.

So he wove with her till the light grew dim,
And daisies closed on the quiet lea,
And the blackbird ended his vesper hymn
On the highest branch of the old elm-tree.
When the minster clock in the tower struck eight,
And shadows lay on the hill's green brow,
She rose and said : 'It is growing late,
And I think that my web is perfect now !'

The years went on, and his youth had fled
When they stood once more in the quaint old room.
Time's snows had silvered her golden head ;
The dust was thick on the broken loom.
But he looked at the web they had wove that day
When Life was young and their hopes were new ;
When he rode o'er the bridge by the leafy way
'Neath a sun that shone from a heaven of blue ;
And, folding in his her white, worn hands,
He kissed her there by the rose-screened sill,
And said : 'Sweet wife, through these faded strands
The thread of our love runs golden still !'

BRIGANDAGE IN EGYPT.

In the summer of 1890 the Egyptian Ministry of Interior sent round a circular to the Mudirs enjoining on them to demolish certain *esbehs*, or groups of houses situated in isolated positions or on the banks of the river. This drastic measure was to be undertaken for curious reasons—namely, that the poor inhabitants of the said *esbehs* should not be plundered by ‘brigands,’ and that the brigands should not use them as places of rendezvous. These brigands greatly exercised the police, and, in truth, scarcely a week passed without a paragraph in the newspapers with the alarming title of Brigands, and recounting the doings, more or less daring, of these industrials. Again and again, in all directions throughout the provinces, private houses had been attacked by armed men, shots exchanged with the inmates, and not unfrequently there were killed and wounded on both sides.

In May, in the Mudirieh of Beherah, a band of one hundred and twenty Bedouins fell upon a village to carry off the cattle. The inhabitants, with the help of neighbours, resisted the attack, and there were many wounded on both sides. Several other attacks on villages in Lower Egypt were reported in the same month. Next month, June, brigandage was brisk, and fairly successful. In Beherah district a band of Bedouins ‘conveyed’ forty camels; while in Manufieh, Assiout, and Minieh, cattle were lifted, a *ghaffir* (watchman) or two killed, and wounds, more or less severe, inflicted on robbers and robbed. Not long afterwards, in the Shoubra Avenue, in the environs of Cairo, the police patrol came upon some of these gentry, like old-time patriarchs, peacefully driving off a mixed lot of camels, cattle, and donkeys. Naturally irritated at being disturbed in the exercise of their vocation, they fired into the police; the police replied, and brought down—not a brigand—but an unhappy camel. The rest of the spoil was secured by the retreating robbers, the police not having numbers or courage enough to press them close. Sometimes there is

a kind of pitched battle, as in the Keneh Mudirieh, in August, where some members of the brigand band of Zaid and Ismail resisted the police for about two hours, suffering loss in killed, wounded, and prisoners.

September was specially lively. In the province of Assiout, the factory of a M. Sef was attacked, nine camels stolen, and a native shot. In Garbieh province, Lower Egypt, the watchmen at a country-house were knocked down, and six bullocks and four donkeys carried off. At Bassioum, in the same province, a raid was made upon the cattle. About the middle of the month it was reported from Damanhour, in Beherah province, that a certain Abu Zed, an escaped convict, at the head of a fully-armed band, was spreading terror in the country round about, and had hitherto escaped the attentions of the mounted police. In broad daylight he attacked a country-house, pillaged it throughout, killing in the process one *fellah* and wounding two others by gunshots. As soon as the authorities heard of the outrage, they sent out soldiers in pursuit; but while these were searching for the robbers in one direction, the latter were busy in another, attacking and pillaging the village of Sannour, and killing a Greek subject who tried to resist the invasion. Nor were the operations of the brigands confined to the dry land. In the same month of September, a sailing-boat was boarded on the Nile, near Mellaoui. The cargo, consisting of sheep, was seized, while the captain, crew, and passengers were bound and thrown into the bottom of the boat. The brigands next proceeded to lower the mast, break the rudder; and having pushed the boat out towards the middle of the stream, they departed in peace with their booty.

About this time a native was killed and his horse stolen on the road between Cairo and Ghizeh. Thereafter, we several times experienced difficulties with donkey drivers. We would hire a donkey at night in Cairo, and without saying where we were going, start off for Ghizeh, where we stayed. We would get

along famously while traversing the broad and well-kept roads of the Ismailia quarter; the zealous driver in the rear keeping up the pace of the donkey with intermittent 'Ahs!' and resounding stick-whacks. But when we left the town and clattered over the Nile bridge, the alarmed donkeyman began to ask: '*Riah fain?*' (Where are you going?) At the word 'Ghizeh,' and the aspect of the black, impenetrable, Egyptian darkness that lay before us in the Lebbeck tree arcade on a moonless night, man and donkey called a halt. Even offers of extra 'baksheesh' are unavailing. Nor will the donkey move a step without the man; so we have to dismount and grope our way onward on foot, leaving the Arab rascal to mourn the fare he has *not* got through his fear.

Though in many cases the authorities have not been able to lay hands on the wandering depredators, who, after a successful haul, can disperse for a time among the villages, or retire to the desert and the rocks, never far remote from the river in Upper Egypt, yet they sometimes are on the winning side. In July the Keneh police secured some fifty members of a band led by 'the famous Ismail Kassem,' and some months before, the same Keneh police bagged a still more 'famous' personage in the self-styled 'chief of all the robbers of Upper Egypt,' Zaid Abdalla, his brother, and some seventy members of his band.

We were in Keneh shortly after the capture of this 'famous' worthy, and had an opportunity of seeing him in prison. The prison was a one-storied, white-washed range of buildings, placed round a large open courtyard, where Egyptian troops kept guard with fixed bayonets and loaded rifles. The door behind which the desperadoes were confined was not what you would expect in a jail, and a fairly stout kick might have demolished the mouldy wood composing it. As our party entered, accompanied by several police officers and legal luminaries from the courthouse of the Mudirieh hard by, some scores of prisoners, all collected in one room, rose to their feet and stood in double rows, down which we passed in single file, so close to them as almost to brush against them in passing. In fact it occurred to us that any evil-minded and desperate character might easily have seized one of us by the throat and strangled him on the spot. The officials so far recognised the peculiarities of the situation by making us leave our sticks outside, in case some Arab might be tempted to clutch them.

The prisoners were a very mixed crowd. There were young boys and old men; densely black-skinned negroes mingling with the lighter skins of Lower Egypt and the surrounding desert. Among them was one fellow clothed in European style. He was lying on the ground, and had tied round his head a white cloth deeply stained with blood, which had oozed through from some wound. Passing these commoner ruffians, we were brought to a door fastened by a wooden wedge loosely thrust into a staple. Here was secured in solitary state Zaid, the hero of the hour, about whose capture the police were much puffed up, and introduced us to interview him as to the audience of a great man. Zaid was not a bad-looking fellow of about thirty-five, of

sleek healthy aspect, and well clad in Arab fashion. One of his arms was wrapped in bandages and strapped across his breast. We interviewed him by an interpreter. His arm, he said, had been shot through in two places by the police in the skirmish preliminary to his capture. Asked how long he had been engaged in killing and robbing, he denied the soft impeachment; but afterwards admitted having, as it was more euphemistically put, levied 'taxes' on the sordid industrial plodders of the surrounding parts. Taking X for some prominent personage in the administration, he asked, with a wistful light in his intensely dark eyes, if he would pardon him. This X generously assured him he was ready to do—only he had no say in the matter. On taking leave of Zaid, we again brushed shoulders with the ragged crowd on our way to the exit, and had a glimpse of another room filled also with a motley band of malefactors.

We were next asked to go to see Zaid's woman-kind; for the police, previous to bagging the chief, had made a clean sweep of his wives, sisters, cousins, and aunts, and clapped them all into Keneh prison—their idea being that the bereaved robber would be caught prowling around to discover the fate of his missing relatives. The strategy was justified by success.

On our way to the part of the prison where the women were, we met a gang of prisoners coming in from outside work. They were a ragged crew, young and old, laden with chains, which clanked as they went along surrounded by guards with fixed bayonets. The fastening of the door where the women were imprisoned was a work of art. The door, of decayed wood, had great cracks and holes in it. Through some of these holes, a long chain, such as is used to fasten a string of prisoners together when on the march to and from their work, had been passed along the inside of the wall to an adjoining iron-barred window, then through between the bars and along the outside wall to the door. The chain was wound round in this fashion again and again in a complicated series of folds, and finally fastened by a padlock. To undo this ingenious arrangement was a work of time and patience, so we had leisure to observe a large basin placed outside the door, and containing a heterogeneous mass of edible matter in the shape of rice, fragments of meat, vegetables, bits of bread, &c., all mixed up together. This, we were informed, constituted an offering from certain charitably-minded inhabitants of Keneh for the good of the unfortunates we were going to see.

The door being at length open, we found a dozen or more women with a number of children squatting on the dirty earthen floor. Most of the women had the blue-black native garment drawn over their heads, or wore the peculiar Eastern veil, so that their faces were hidden. One virago started a noisy jeremiad as soon as we entered, declaring she had nothing to do with Zaid, and anathematised him and all his works. She was put to silence with much difficulty. A young girlish figure crouching against the wall was pointed out as Zaid's latest acquired wife—he had several. She resisted endeavours to get a look at her face, keeping her head down and firmly wrapped in her cloak. On X asking what she would take for a ring she wore, she said

faintly, without raising her head, 'A millime.' He gave her ten piastres, and pocketed the relique.

Just then the dish of food was brought in and set down in the midst, when a poor little fellow about two years old, with quite a light-coloured, European-like skin, and in a practically naked state as he sat on the bare ground with a solemn bewildered expression, cast a wistful eye upon it, and hesitatingly stretching out his tiny arm, took his small handful of the much-mixed mass. Taking a step aside, I nearly trod on a small bundle of blue cloth which I discovered to be a baby a few weeks old, sleeping peacefully, with one extremely small doll-like arm stretched out on the dirty earth. In a dark corner against the wall, as far removed as possible from where the prisoners were sitting, was another and larger bundle covered with a white cloth. It was a dead body. The young son of the robber-chief had died in prison the previous night, and was lying here, while his father awaited sentence of death in a cell a few yards off.

Zaid, however, would not submit tamely to the sentence of the Keneh court, and appealed unto Cæsar at Cairo. Thither, accordingly, after some time and trouble, he and his band were conveyed under a strong escort. I have several times met such convoys of prisoners marching across the Nile bridge on their way to the prison at Ghizeh. They trudge along, a ragged, motley, bare-footed band, small brown-skinned boys and girls in front, women with babies on their shoulders, and huge bundles of household goods on their backs, then a crowd of men of all ages and colours, the whole hedged in before, behind, and round about by black Soudanese troops with fixed bayonets. The light dry dust rises in a cloud about the many moving feet, and sweat bathes the faces of guards and guarded, as the strong sunlight beats on the melancholy spectacle.

In view of the frequency of acts of brigandage, the Government, in the month of April (1890), submitted to the Legislative Council a special decree defining the penalties to be inflicted on organisers, leaders, and members of armed bands. While some of the members of the Council favoured the Government project, the majority declared for the proposals of one of their own members, Sheikh Mohamed Effendi El Abassi. He, at the request of the Government, had embodied in a projected decree the relevant 'prescriptions of the Holy Law in force in all the countries dependent on the Ottoman Empire.' There is a sliding scale of penalties. A brigand who is arrested before having robbed or killed anybody would get a dose of bastinado and be imprisoned till he repents—or dies. Brigands who have seized property to the extent of ten dirhems each—provided this is in good money or in kind—would be condemned to amputation of the right hand and the left foot. But desperate characters who have taken part in both theft and murder have presented to them the following interesting programme: (1) Amputation of right hand and left foot, followed by capital execution: (2) Amputation as above and crucifixion. (3) Amputation as above, capital execution, and crucifixion. (4) Capital execution and crucifixion. (5) Capital execution alone. (6) Crucifixion alone. The above scale to be

applied according to the 'enormity of the offence or the discretion of the judge.

The project submitted by the Government was less elaborate than that of the Sheikh. It was that any operation of a band involving murder should bring the death penalty on the leaders or organisers of the band. When there was no murder, the leaders and organisers should be punished with forced labour for life; while in either case the ordinary members should perform forced labour for life or for a term of years.

THE IVORY GATE.*

BY WALTER BESANT.

CHAPTER XX.—THE WHISPER OF CALUMNY.

WHISPERED words are ever more potent than words proclaimed aloud upon the house-top. If the envious man from the house-top denounces a man of reputation as a thief, a gambler, a patricide, a sorricide, amicicide, no man regardeth his voice, though he call out with the voice of Stentor: people only stare: these are the words of a madman or a malignant. But whisper these charges in the ear of your neighbour: whisper them with bated breath: say that, as yet, the thing is a profound secret. Then that rumour swiftly flies abroad, until every Burgess in the town regards that man askance; and when the time for voting comes, he votes for another man, and will not have him as beadle, sexton, verger, schoolmaster, turncock, policeman, parish doctor, workhouse chaplain, common-councilman, alderman, Mayor, or Member of Parliament. And all for a whisper.

It was Checkley who set going the whisper, which at this moment was running up and down the office, agitating all hearts, occupying all minds, the basis of all conversation.

King Midas's servant, when he was irresistibly impelled to whisper, dug a hole in the ground and placed his whisper at the bottom of that hole. But the grasses grew up and sighed the words to the passing breeze, so that the market-women heard them on their way: 'The King's ears are the ears of an Ass—the ears of an Ass—the ears of an Ass.' The old and trusty servant of Dering & Son buried his secret in the leaves of his Copying-book. Here it was found by the boy who worked the Copying-press. As he turned over the pages, he became conscious of a sibilant, malignant, revengeful murmur: 'Who stole the bonds? The new Partner.—Who forged the letters? The new Partner.—Who robbed the safe? The new Partner.' Here was a pretty thing for a pretty innocent office boy to hear! Naturally, his very soul became aflame: when the dinner hour arrived, he told another boy as a profound secret what he had heard. That boy told an older boy, who told another still older, who told another, and so up the long official ladder, until everybody in the place knew that the new Partner—actually the new Partner—the most fortunate of all young men that ever passed his Exam.—who had stepped at a bound from

* Copyright 1892 in the United States of America by Harper & Brothers.

two hundred to a thousand, at least—this young man, of all young men in the world, had forged his partner's name, robbed his partner's safe, made away with his partner's property. Who after this can trust anybody?

But others there were who refused to believe this thing. They pointed out that the new Partner continued—apparently—on the best of terms with the old Partner: they argued that when such things are done, friendships are killed and partnerships are dissolved. They even went so far, though members of the great profession which believes in no man's goodness, as to declare their belief that the new Partner could not possibly by any temptation do such things. And there were others who pointed to the fact that the whisper came from the boy of the Copying-press: that he heard it whispered by the fluttering leaves: and that it was imparted to those leaves by Checkley—old Checkley—whose hatred towards the new Partner was notorious to all men: not on account of any personal qualities or private injuries, but out of the jealousy which made him regard the Chief as his own property: and because he had been deprived of his power in the office—the power of appointment and dis-appointment and the raising of screw, which he had previously possessed. Checkley was dethroned. Therefore, Checkley spread this rumour. Others, again, said that if the rumour was really started by Checkley, which could not be proved, seeing that, like all whispers or rumours, the origin was unknown, and perhaps supernatural, then Checkley must have very strong grounds for starting such a thing.

Thus divided in opinion, the office looked on, expectant. Expectancy is a thing which gets into the air: it fills every room with whispers: it makes a conspirator or a partisan or a confederate of every one: it divides a peaceful office into camps: it is the cause of inventions, lies, and exaggerations. There were two parties in this office—one which whispered accusations, and the other which whispered denials. Between these hovered the wobblers or mugwumps, who whispered that while on the one hand—on the other hand—and that while they readily admitted—so they were free to confess—Everybody knows the wobbler. He is really, if he knew it, the master of the situation; but, because he is a wobbler, he cannot use his strength. When he is called upon to act, he falls into two pieces, each of which begins to wobble and to fall into other two pieces of its own accord. The whole process of a Presidential Election—except the final voting—was going on in that office of half-a-dozen rooms, but in whispers, without a single procession, and not one German band. And all unconscious of the tumult that raged about him—a tumult in whispers—a civil war in silence—the object of this was going on his way unconscious and undisturbed.

Now, however, having learned that the old clerk was actually seeking to fix this charge upon him, George perceived the whispering and understood the charge. When he passed through the first or outer office in the morning, he perceived that the clerks all looked at him curiously, and that they pretended not to be looking at him, and plied their pens with zeal. On the stairs he met an article clerk, who blushed a

rosy red with consciousness of the thing: on his way to his own room through his own clerks' room, he felt them looking after him curiously as he passed; and he felt them, when his own door was closed, whispering about him. This made him extremely angry. Yet, for a whisper, one cannot suffer wrath to become visible. That would only please the whisperers. There is only one thing worse than to be suspected rightly: it is to be suspected wrongly; for the latter makes a man mad. What? That he—even he—the man of principle and rule, should be suspected! Does nothing, then—no amount of character, no blamelessness of record, avail? Is the world coming to an end?

George then shut his door and sat down to his table in a very wrathful and savage frame of mind. And while he was just beginning to nurse and nourish this wrath, coaxing it from a red glow to a roaring flame, a card was brought to him.

'I will see Sir Samuel at once,' he said.

It is as well that we do not hear the remarks of the clerks' room and the servants' hall. The Service, in fact, is a body of critics whose judgments would, if we only heard them, cause us to reconsider our self-respect. Great Philanthropist, great Statesman, saintly Preacher—if you only knew what they say of you—down below!

The clerks, as Sir Samuel Dering—his face composed to the solemnity of a mute—walked into the new Partner's room, whispered to each other: 'He's going to finish him. There'll be a bolt to-night.—He won't dare face it out.—He has got a nerve!!!—The game's up at last.—They won't prosecute; you see if they do.—If it was one of us, now.—Sir Samuel's come to warn him—now you'll see.' With other exchanges and surmises.

Sir Samuel, big and important, coldly inclined his head and took a chair. 'A few words,' he said—'a few serious words, if you please, sir.'

'Pray, go on.' George sat up and listened, his upper lip stiffened. He knew what was coming. The thing which Sir Samuel proposed to say, apparently became difficult. He turned red and stammered. In fact, it is very difficult to inform a highly respectable young man in a highly respectable position that he is going to be charged with a crime of peculiar atrocity.

'I am here,' he said, after two or three false starts, 'without my brother's knowledge. This is a private and unofficial visit. I come to advise. My visit must be regarded as without prejudice.'

'Is it not well to ask first of all if your advice is invited?'

'In such a case as this, I venture to obtrude advice,' Sir Samuel replied with dignity. 'There are occasions on which a man should speak—he is bound to speak. You will remember that I was to have been your brother-in-law.'

'You are to be my brother-in-law. Well, Sir Samuel, go on. I will hear what you have to say.'

'You are, as no doubt you suspect and fear, about to be charged in company with another, with complicity in this long series of forgeries.'

'Really. I heard last night from Elsie that there was some talk of such a charge. Now, Sir

Samuel, a man of your experience must be aware that it is not enough for a foolish old clerk to suggest a charge; but there must be some connection between the accused person and the crime.'

'Connection? Good Heavens! There is a solid chain of evidence, without a single weak point.'

'Is there indeed? Well, we will not ask for the production of your chain. Let us take it for granted. Go on to the next point.'

'I wish, young gentleman, I wish most sincerely, for the credit of yourself, and for the happiness of the unfortunate girl who has given you her heart, that my chain was of glass, to fly into a thousand fragments. But it is not. Everything is complete. The motive: the tempter: the conspiracy: the working out: the apparent success—everything complete. The motive—want of money.'

'Want of money? Well, I was pretty badly off. That cannot be denied. Go on.'

'You wanted money—both of you—wanted money. In ninety cases out of a hundred, this is the cause—wanted money. So you went and did it. Always the way in the City—they want money—and so they go and do it—go and do it.'

'I see. Well, we need not have the tempter and the rest of it. They can wait. Let us go on to the advice.'

'Just so. What I came to say is this. You are in a devil of a mess, young gentleman: the whole job is found out: there's no use in trying to brazen it out. Best come down at once.'

George nodded with as much good-humour as he could assume under the circumstances.

'Down at once,' Sir Samuel repeated. 'It is always best in the long run. In your case, there is every reason why a scandal should be avoided. The thing hasn't got into the papers: we are only yet in the first stage of finding out what has been actually stolen: it has not been a case in which the police could help. Now my brother is not a vindictive man. I, for my own part, don't want my wife's brother, to say nothing of you, convicted of forgery. Eh? Beastly thing, to go down to the City in the morning and to hear them whispering, "That's his wife's brother in the papers to-day. Lagged for fifteen years." Fifteen years for certain, it will be, my fine fellow.'

'Fifteen years for certain,' George repeated.

'Let me help you out of the mess. Don't make difficulties. Don't stick out your chin. Think of Elsie!'

George nearly lost his self-control—not quite.

'Think of Elsie!' he cried. 'Best not mention her name, Sir Samuel, if you please.'

'She would be heart-broken if it went so far. If it stops short of that, she will soon get over the little disappointment.'

'Go on to the next point.'

'Well—it is just this. I'll help you both—Athelstan as well as you—yes—I'll help Athelstan. Hang the fellow! Why couldn't he stay at Camberwell? Who cares about him and his bad company, if he keeps himself out of people's way? Now, then. Let me have back the money. You haven't drawn anything out of the

Bank. Give me the papers. Then I'll square it with my brother. I will advance you a hundred or two: you shall go clear out of the country, and never come back again. And then, though it's compounding a felony, we'll just put everything back again, and say nothing more about it.'

'Oh! That is very good of you.'

'Yes, I know. But I want to make things easy. I don't want a beastly row and a scandal. As for Athelstan, I shouldn't know the fellow if I ever saw him. I hardly remember him. But for you, I've always had a liking, until these little events happened.'

'Very good, indeed, of you.'

'When the thing came out, I said to Lady Dering. "My dear," I said, "I'm very sorry for your sister, because it will vex her more than a bit. The engagement, of course, will be broken off; but we must not have a scandal. We cannot afford it. We can not"—he smiled—"we are positively not rich enough. Only the very richest people can afford to have such a scandal. I will try and get things squared," I said, "for all our sakes." That is what I said to Lady Dering. Now, be persuaded. Do the right thing. Tell Athelstan what I have told you. The warrant for the arrest of the man Edmund Gray will be issued to-morrow, I suppose, or next day. After that, nothing can save you.'

'Nothing can save me,' George repeated. 'Is that all you came to say, Sir Samuel?'

'That is all. A clean breast is all we ask.'

'Then, Sir Samuel'—George rose and took a bundle of papers from the table—'let us find my Partner. You shall hear what I have to say.'

'Ah! that's right—that's sensible. I knew that you would be open to reason. Come. He is sure to be alone at this early hour. Come at once.'

They went out together. The clerks noticed their faces full of 'business,' as we poetically put it—matters of buying and selling being notoriously of the highest importance conceivable. Evidently something very serious indeed had passed. But the chief personage still held up his head. 'Game, sir, game to the last. But there would be a bolt.'

Mr Dering was in his usual place, before his letters, which were still unopened. He looked ill, worn, and worried.

'Brother,' said Sir Samuel, 'I bring you a young gentleman who has a communication to make of great importance.'

'Is it about this case? Have you—at last—found out something?' The tone, the words, suggest extreme irritability.

'I fear not. You know, I believe, all that we have found out. But now,' said Sir Samuel, rubbing his hands—'now comes the long-expected—'

'What I have to say will not take long. I hear from Sir Samuel that he and Checkley between them have got up a case which involves me in these forgeries.'

'Quite right,' said Sir Samuel. 'Involves you inextricably.'

'And that things have gone so far that I am about to be arrested, tried, and convicted. Which he rightly thinks will be a great scandal. So it

will—so it certainly will. He therefore proposes that I should make a clean breast of the whole business, and give back the stolen bonds. I am sorry that I cannot do this, for a very simple reason—namely, that there is nothing to confess. But there is one thing that I must do. You placed the case in my hands’—

‘I did. I asked you to find out. I have brought no charge against you. Have you found out?’

Mr Dering spoke like a schoolmaster in one of his least amiable moods.

‘It is a very improper thing for a person accused of a crime to be engaged in detecting it. So I resign the case—there are the papers. You had better go to some solicitor accustomed to this kind of work.’

‘Stuff and rubbish!’ cried Mr Dering.

‘Sir, you have deceived me.’ Sir Samuel’s face was gradually resuming its normal length. ‘You promised to confess, and you have not. You as good as confessed just now.—This man is clearly, unmistakably guilty,’ he added, turning to his brother.

‘I have not asked you, my Partner,’ Mr Dering added, more softly, ‘to give up the case. I have heard what is said. I have observed that the so-called case is built up entirely on conjecture.’

‘No—no,’ said Sir Samuel. ‘It is a sound structure, complete in every part.’

‘And there is nothing as yet to connect any man with the thing—not even the man Edmund Gray.’

‘Quite wrong—quite wrong,’ said Sir Samuel. ‘In the City, we may not be lawyers, but we understand evidence.’

‘I cannot choose but give up the case,’ George replied. ‘Consider. Already Mrs Arundel has requested her daughter to break off her engagement; I am forbidden the house; Elsie has left her mother and gone to her brother. No, sir—take the papers, and give them to some other person.’

Mr Dering mechanically took the papers, and laid his hand upon them.

‘Let me remind you,’ George continued, ‘how far we have got. We have proved that Edmund Gray is a real person, known to many. We have not proved the connection between him and the robberies committed in his name. He is apparently a most respectable person. The problem before you is still to fix the crime on some one. I shall be glad to hear that it has been successfully solved.’

‘Glad?’ asked Sir Samuel. ‘You will be glad? This is amazing!’

‘Eight years ago, Mr Dering, another man stood here, and was accused of a similar crime. He refused to stay in the house under such a charge. That was foolish. Time has established his innocence. I shall stay. I am your Partner. The Partnership can only be dissolved by mutual consent. I remain.’

Mr Dering laid his head upon his hand and sighed. ‘I believe I shall be driven mad before long with this business,’ he said querulously. He had lost something of his decision of speech. ‘Well, I will give the case to somebody else. Meantime, look here. Tell me how these things came here.’

The ‘things’ were two envelopes containing

letters. They were addressed to Edmund Gray, and had been opened. One of them was George’s own note inviting him to call. The other was the letter from the Manager of the Bank asking for other references.

‘How did they get here?’ asked Mr Dering again.

‘Had you not better ask Checkley?’ George rang the bell.

‘I found these on the top of my letters, Checkley,’ said Mr Dering. ‘You were the first in the room. You put the letters on the table. I found them on the top of the heap. Nobody had been in the room except you and me. You must have put them there.’

Checkley looked at the envelopes, and began to tremble. ‘I don’t know,’ he said. ‘I put the letters on the table. They were not among them. Somebody must have put them there’—he looked at the new Partner—‘some friend of Mr Edmund Gray, between the time that I left the room and the time when you came.’

‘I entered the room,’ Mr Dering replied, ‘as you were leaving it.’

‘Observe,’ said George, ‘that in the whole conduct of this business there has been one man engaged who has control of the letters. That man—the only man in the office is, I believe, the man before us—your clerk—Checkley.’

‘How came the letters here?’ Mr Dering repeated angrily.

‘I don’t know,’ answered Checkley. ‘He’—indicating George—‘must have put them there.’

‘The Devil is in the office, I believe. How do things come here? How do they vanish? Who put the notes in the safe? Who took the certificates out of the safe? All you can do is to stand and accuse each other. What good are you—any of you? Find out. Find out. Yesterday, there was a handbill about Edmund Gray in the safe. The day before there was a handful of Socialist tracts on the letters. Find out, I say.’

‘Give the thing to detectives,’ said George.

‘Let me take the case in hand, brother.’ Sir Samuel laid hands on the papers. ‘I flatter myself that I will very soon have the fellow under lock and key. And then, sir’—he turned to George—‘scandal or no scandal, there shall be no pity—no mercy—none.’

George laughed. ‘Well, Sir Samuel, in a fortnight or so I shall call myself your brother-in-law. Till then, farewell.’ He left the office and returned to his own room, the ripple of the laughter still upon his lips and in his eyes, so that the clerks marvelled, and the faith of those who believed in him was strengthened.

‘Before then, young crowing bantam,’ cried Sir Samuel after him, ‘I shall have you under lock and key.’

‘Ah!’ This was Checkley. The little interjection expressed, far more than any words could do, his satisfaction at the prospect. Then he left the room grumbling and muttering.

‘I believe that this business will finish me off,’ Mr Dering sighed again, and passed his hand over his forehead. ‘Night and day it worries me. It makes my forgetfulness grow upon me. I am as good as gone. This hour I cannot remember the last hour. See—I had breakfast at home as usual. I remember that. I remember setting out. It is ten minutes’ walk from Bedford Row to

here. I have taken an hour and a half. How? I do not know. What did I do last night? I do not know, and I am pursued by this forger—robber—demon. He puts things in my safe—yesterday, a placard that Edmund Gray was going to give a lecture on something or other—the day before, a bundle of tracts by Edmund Gray. What do these things mean? What can I do?

(To be continued.)

ON THE GREAT ANDES; OR, LIFE AT LOW PRESSURES.

EVERY one knows what, in a moral sense, life at high pressure means. The phrase is one borrowed from applied science, and is perhaps still more aptly designated in the popular saying about 'burning the candle at both ends.' Well, what 'high pressure' is in the moral world, so is 'low pressure' in the physical—both bring about more or less of injury and collapse. In both cases the cause is obvious; it is due to departure from a normal state of existence. The man who goes to bed at daybreak, and does the most of his work or amusement when other people are asleep, violates the recognised healthful division of time; so the man who, in a physical sense, ceases to occupy a level at which the body is subjected to an atmospheric pressure of fifteen pounds to the square inch cannot very comfortably exist where the pressure is so low as to be little more than half of this. At sea-level, or at a reasonable distance above it, we are not aware of any pressure upon us—everything is so evenly balanced within us and around. But let us ascend a high mountain—say Mont Blanc, or Chimborazo, or Cotopaxi—or let us go up still higher in a balloon, and then we perceive what occurs: difficulty of breathing, bleeding at the nose and the gums, even the lips and the eyes, a tendency to faint, or even to die (as has happened). This is due to the absence of that mysteriously comforting fact about the fifteen pounds of atmospheric pressure to the square inch—is, in short, due to living at 'low pressures,' or 'out of our usual.'

From a scientific point of view, the phenomena of life at low pressures are exceedingly interesting, and have not yet received either complete elucidation or conclusive explanation. Mr Whymp, in his latest book (*Travels amongst the Great Andes of the Equator*. London: John Murray), has devoted much space to the question, and has certainly succeeded in arriving at some important conclusions. The book, as all his books are, is a thing at once of beauty and of utility; for he is equally traveller, artist, author, and man of science. We shall endeavour to give some account of Mr Whymp's experiences on those great altitudes at which he lived amongst the majestic mountains of the equatorial Andes.

One of the principal scientific objects of Mr Whymp's journeys among the mountain ranges of South America had reference to the well-known difficulty of living at an abnormally high level above the sea. At what time this difficulty was first recognised by men of science, is not perhaps known. We are all acquainted with the

ancient prejudices attaching to the attempt to scale sacred mountains—say, that of Ararat. As the site on which the ark of Noah rested after the flood, Mount Ararat was naturally associated with much that was sacred in the history of the Jewish religion; and the attempt to reach its summit to ascertain whether any trace of the ark was still there, was regarded as sacrilegious. To any one who attempted the feat, it was believed that death was the consequence. It is not difficult to perceive the origin of this belief. Ararat is a thousand feet higher than Mont Blanc; and any adventurer in the old and unscientific ages who made so bold as to scale its lofty height, would no doubt suffer from that state of breathlessness and bleeding at the mouth and nose to which we have referred. This was quite enough to stamp the attempt as one displeasing to the Deity; and such as, if persevered in to the end, would result in death. So thorough was this belief in the minds of the semi-barbarous inhabitants of Armenia, that it was not until the present century that any mountain-climber actually reached the summit of Ararat.

What held true of Mount Ararat held true also of Mont Blanc. In 1775 four natives of Chamouni attempted the ascent of the latter mountain, and succeeded in reaching a considerable height. So far as they went they found their route comparatively free from mechanical obstacles, but they were completely overcome by fatigue and difficulty of breathing. Being ignorant of science, they did not attribute this oppression to its right cause. They thought it was due to the heat of the sun's rays in the confined ravines through which they had to pass; the difference of atmospheric pressure as between high and low levels not, of course, occurring to their untutored minds. M. de Saussure was the first man of science to reach the top of Mont Blanc. This was in August 1787. He has graphically described his extraordinary sufferings from the heat and rarity of the atmosphere. But he was a man of science, and knew that his sufferings were due, not to any so-called curse upon those who would seek to reach the summit, but simply to the fact that the barometer, instead of showing a pressure of thirty or thirty-one inches, showed only a pressure of sixteen. It is this abnormal reduction of atmospheric weight which induces those symptoms of suffocation that occur in high altitudes—whether the situation be on Mount Ararat or Mont Blanc.

That the symptoms of this illness—Mountain-sickness, as it is now called—are mainly due to the change of atmospheric pressure, is generally admitted; but as this change does not affect all individuals alike, and does not operate alike in all localities, there are many persons who seek to attribute the sickness to other co-operating causes. The subject has appeared to Mr Whymp as worthy of careful investigation, more particularly for ascertaining the heights at which those painful effects begin to manifest themselves, what the symptoms of those effects are, and whether the effects are permanent. The leading symptoms of this Mountain-sickness are, according to him, 'nausea and vomiting; headaches of most severe character; feverishness; hemorrhages; lassitude, depression and weakness, and

an indescribable feeling of illness ;' which illness, occurring at great elevations, is only cured by descending into lower zones. While, therefore, high elevations, and consequent diminished atmospheric pressure, have obviously to do with Mountain-sickness, yet, says Mr Whympier, 'in various parts of the world, the notion is, and has long been entertained, that it is due to local causes, such, for example, as noxious exhalations from vegetation. Some support to this notion,' he adds, 'seems to be found in the fact that whilst the greatest heights in Europe (15—16,000 feet) are annually ascended by throngs of persons without perceptible inconvenience, multitudes of others in Asia and America suffer acutely at lower elevations (14—15,000 feet); and it would therefore seem that there are influences at work on the latter continents which do not operate in Europe.' In short, he thinks Mountain-sickness may to some extent be attributable to the frailties of human nature. In some individuals it may be superinduced by their inability to bear severe and prolonged exertion, so that circumstances which might inconvenience them would give little or no inconvenience to others. We shall see what Mr Whympier's own experiences were.

These began with his ascent of Chimborazo, which was accomplished in January 1880. His first camp was at a height of something like 15,000 feet above sea-level; and up to this point neither he nor his attendants had suffered much inconvenience from the reduction of pressure. But when they had moved on another thousand feet higher, evidences of distress began to manifest themselves. Curiously enough, it was one of the mules that first showed tokens of exhaustion. It was probably the same animal which, at a slightly lower level, had been in particularly good spirits just a day or two before. On that occasion, says Mr Whympier, 'there was a noise, and I became aware that the mule had broken loose and was frisking about. The animal rejoiced in freedom, and, intoxicated by success, went as near to standing upon its head as a mule can go. Its behaviour seemed to me supremely ungrateful, and I went for that animal. It ran away; but it was handicapped, for it had a long halter, which trailed along the sandy plain, whilst I ran unimpeded, and gained on it at every stride. When I seized the halter it was I who was captured. The wretched beast dragged me unmercifully over the sandy soil until Louis came to my assistance, and we then towed it in triumph back to camp.' But at 16,000 feet above the sea, and with a pressure of a little over seventeen inches, mules are not so lively. At this altitude, Mr Whympier's mule struck work, and he had to dismount and lead it. It obviously found difficulty in supporting its own weight. 'Looking back, to see how the rest were progressing, I found that they were scattered over about half-a-mile, and that all the animals were in difficulties, though none carried more than one hundred and sixty pounds.' The falling barometer was clearly too much for the mules.

But the human members of the expedition were soon to feel a similar degree of affliction. Shortly after they reached their second camp at 16,664 feet, they were on their backs, and incapable of the least exertion. 'We knew that the evening was upon us, and that we were ex-

periencing our first attack of Mountain-sickness. We were feverish, had intense headaches, and were unable to satisfy our desire for air, except by breathing with open mouths. This naturally parched the throats, and produced a craving for drink, which we were unable to satisfy—partly from the difficulty of obtaining it, and partly from trouble in swallowing it. When we got enough, we could only sip, and not to save our lives could we have taken a quarter of a pint at a draught. Before a mouthful was down, we were obliged to breathe and gasp again, until our throats were as dry as ever. Besides having our normal rate of breathing largely accelerated, we found it impossible to sustain life without every now and again giving spasmodic gulps, just like fishes when taken out of water. Of course there was no inclination to eat; but we wished to smoke, and found that our pipes almost refused to burn, for they, like ourselves, wanted more oxygen.'

This painful condition of affairs continued all night, and all next day; but was ultimately relieved by the administration of chlorate of potash—ten grains to a wine-glass of water—the dose repeated every two or three hours, if necessary. The trouble was gradually overcome to such an extent as to make further ascent possible; but still the party suffered much from lassitude and a desire to lie down. They started from their third camp on January 4, at 5.40 A.M., the morning being fine and nearly cloudless. At ten o'clock they had reached the height of 19,400 feet, and for some distance farther continued to progress at a reasonable rate through the soft snow, having fine weather and a good deal of sunshine. At eleven o'clock they were 20,000 feet above sea-level, and could see the two summits of the great Chimborazo. The one they scaled first turned out not to be the highest, and they boldly struck out for the other summit. For five hours—as the snow was hiding many crevasses—they could only proceed by crawling along the surface on all-fours; but at length they reached the highest summit of the mountain, and their labours were rewarded with success. They stood at an elevation of 20,498 feet above the sea. The wind, by this time, blew hard from the north-east, and drove the light snow before it viciously. Mist also had set in, and not much beyond the mountain could be seen. So, as there was only another hour and a quarter of daylight left, they had at once to start on their downward journey in order to reach their camp, which they gained just as daylight was vanishing.

After his final descent from this great mountain, Mr Whympier and his party rested awhile and recruited; at the end of which period he prepared to make the ascent of the highest active volcano in the world—Cotopaxi, in Ecuador, 19,613 feet above the sea. Though slightly lower than the peak of Chimborazo, the cone of Cotopaxi presents features which lend to it an interest peculiarly its own. It stands on a high base—the valley at its foot being 9000 feet above sea-level. The upper part of the mountain, however, consists of a perfect cone of 4400 feet, completely covered with snow, except that the edge of the crater on the top is formed of bare rock, the result doubtless of the fiery glow and the steam emitted from the mouth of the volcano.

In 1877 Cotopaxi was especially active. On the 21st of June, soon after midday, and apparently without warning, an immense black column was projected about twice the height of the cone (say, 18,000 feet) in the air, and was accompanied by tremendous subterranean bellowing. The summit glowed at night, but next morning its appearance was normal until 6.30 A.M., when another enormous column rose from the crater. These eruptions were clearly seen from Quito, thirty-five miles distant, and so immense was the quantity of dust and ashes ejected from the volcano that as it drifted north-easterly over the country it carried darkness with it. In Quito it began to be dark at eight o'clock that same morning, the darkness increasing in intensity until mid-day, when it was like night. From the south or windward side, however, the summit of the mountain could be clearly seen; and it was observed, about ten o'clock in the forenoon, that molten lava was being poured through the gaps and notches in the lip of the crater, bubbling and smoking, so it was described, like the froth of a pot that suddenly boils over. 'The scene which then ensued upon the mountain was shut out from mortal eyes, for in a few minutes the whole of it was enveloped in smoke and steam, and became invisible; but out of the darkness a moaning noise arose, which grew into a roar, and a deluge of water, blocks of ice, mud, and rock, rushed down, sweeping away everything that lay in its course, and leaving a desert in its rear.' It is estimated that it travelled as far as Latacuya, twenty-five miles to the south-west, at the rate of fifty miles an hour.

It was this tremendous volcano which Mr Whympet set himself to scale in the month of February 1880. His first camp was pitched at a height of 15,139 feet above the sea. At this level he found lichens growing, also live beetles and a frog; but above this he found nothing, either animal or vegetable, except some shabby patches of moss. When nearing the summit of the cone, the ascent became very difficult, as it had to be made up a smooth slope of soft ashes; and but for the fact that occasional streaks of ice gave some stability to the mass, the ascent would have been almost impossible. As it was, large quantities of débris slipped down at every step.

A few minutes after the arrival of the party at the crater, a roar from the bottom told them that the 'animal'—as one of the attendants called the volcano—was alive. The crater was nearly filled with smoke and steam, which drifted about and obscured the view. 'It had been settled beforehand that every man was to shift for himself if an eruption occurred, and that all our belongings were to be abandoned. When we heard the roar, there was an "it is time to be off" expression clearly written on all our faces; but before a word could be uttered we found ourselves enveloped only in a cloud of cool and quite unobjectionable steam, and we concluded to stop.'

When night fairly set in, the party went up to view the interior of the crater. 'The atmosphere was cold and tranquil. We could hear the deadened roar of the steam-blasts as they escaped from time to time. Our long rope had been fixed both to guide in the darkness, and to

lessen the chances of disturbing the equilibrium of the slope of ash. Grasping it, I made my way upwards, preparing for something dramatic, for a strong glow on the under sides of the steam-clouds showed that there was fire below. Crawling and grovelling as the lip was approached, I bent eagerly forward to peer into the unknown, with Carrel behind gripping my legs. The vapours no longer concealed any part of the vast crater, though they were there, drifting about as before.' The immense amphitheatre thus disclosed was afterwards found to be 2300 feet in diameter from north to south, and 1650 feet across from east to west. It was surrounded by cliffs and overhanging precipices. 'Cavernous recesses belched forth smoke; the sides of cracks and chasms shone with ruddy light; and so it continued on all sides right down to the bottom, precipice alternating with slope, and the fiery fissures becoming more numerous as the bottom was approached. At the bottom, probably twelve hundred feet below us, and towards the centre, there was a ruddy circular spot about one-tenth the diameter of the crater—the pipe of the volcano, its channel of communication with lower regions, filled with incandescent if not molten lava, glowing and burning; with flames travelling to and fro over its surface, and scintillations scattering as from a wood-fire; lighted by tongues of flickering flame which issued from the cracks in the surrounding slopes.' At intervals of about half an hour the volcano regularly blew off steam, with a noise resembling that which is heard when a great ocean steamer performs the same operation; and on these occasions the steam rose in jets with great violence from the bottom of the crater, continually enveloping the beholders.

As to how the low pressures on Cotopaxi affected the party, the result was not so severe as upon Chimborazo. There was of course the overpowering desire to sit down, and the disposition to breathe through open mouths. Some of the party complained also of a rather sharp headache; but there was no recurrence of the more acute symptoms which they had experienced on Chimborazo. It is not improbable that the fact of the party having now lived for some months at very high levels may have led to some degree of acclimatisation. In any case, Mr Whympet states that no perceptible effects were produced—beyond those which have been mentioned—by the low atmospheric pressure which they experienced.

DORIS AND I.

CHAPTER II.

I NEED not dwell on that period; it lies in my memory more like a hideous dream than so many weeks and months of actual life, and like a dream, there are only portions of it which stand out from the shadows—adventures, incidents, scraps of scenery, seen in clearer moments. It is enough to say that I came round gradually, and began to see things as they should be seen. But the hate was all gone, and love alone was left. Yes, love was left, though badly nourished, having no hopes to diet it; and I got accustomed to think

of Doris as one who was dead and yet living, and very lovable withal, even as Beatrice was to Dante.

So a year passed on, and left me minus some thousands of dollars. I had found my way into Colorado, and was a miner at one of the great joint-stock claims which have taken the place of the old-fashioned diggings. The rough work suited my humour, and there was life and go in the town and much distraction in the game of Pharaoh, of which more in its place. For nine months I had not heard from Canada, and had ceased to think of the place. My father had taken kindly to his new life, which was all I needed to know. I wished to be, and was, a solitary in the world, though I mixed much with men, finding more isolation in a crowd than in lonely places. But I was beginning to be restless again, and to wish for another change, when something happened which I had not looked for, but which makes me always thankful I played Pharaoh that night at Midas's.

It was nothing more than a quarrel and a whipping out of revolvers, and then a sudden lane of rough figures looking on while the two fired from either end. I heard the low thud of the bullet as it struck Black Jake, and I caught him in my arms as he fell backwards with sudden limpness and whitening face. I had only seen him once before, and he had roused a vague recollection which had made me look again at him, wondering what it was about him that was so familiar. He had been at one of the far tables, or perhaps his speech would have given me the cue. Now, as he opened his eyes and stared up into mine, he turned his lips from the flask and said: 'God forgive us—it's Master Sedley!'

'That's so. Take a pull at this, and tell me who you are,' said I, surprised at my own name.

The liqueur was of little use; for his heart was slowing every moment; but it brought a flicker to his face and a word or two more to his lips. 'Gie me yer ear—closer,' he whispered. 'Bob Hilton—Ranston postman—ay, yo' know me now. They want me—want me for robbing the bags. Tell 'em death has got me; an' tell young doctor chap as I hopes to— He larned me the beginnin'—he— Yore letters—Miss Doris's—I stopped 'em— His money. Hope no harm done, sir—I— Christ save'— His eyes glazed, a tremble went through him, and he slipped off without another word, leaving me staring at the dyed whiskers and dissipated features with ringing ears, and a thousand thoughts and feelings all set loose together, to the overwhelming of my wits, which seemed quite undone.

Long after they had carried him away, and the noise and confusion were spent, I stood leaning on the bar counter, staring vacantly through the smoke of the saloon, seeing and hearing nothing, but conscious of a growing fiend within me, and a tightening of my teeth as I reckoned things up and saw in all its clearness the perfidy that had come between us. The letter—was not that a part of it? Could Doris from her heart's heart have written such a letter at all? It was a forgery, a trick, and I had been a fool to be duped by it—nay, a villain in very truth; for I had doubted Doris, and given her pain and

miserly perhaps a thousand times worse than my own.

Yet the letter was clear enough, said the ghost of Doubt; it was in her own characteristic handwriting, said Memory; and there was no forging that, put in Doubt again.

Then a resolution came to me, and I walked out into the open air, and breathed it in with a long inhalation, as men do at sudden relief, or when stirred with new purpose.

There were evil things in my heart; but there was one little corner where hope stirred, as if after a long sleep. I could feel it as I looked up to the heavens, where the stars were twinkling down at me, as if they knew a thing or two, having seen Doris only a few hours ago.

Next morning I started for New York, and in four more days was on the Atlantic, gazing at the last point of Sandy Hook as it sank lower and lower, till the horizon was an unbroken line and America nowhere.

But as we sped eastwards through the long days and nights, as I drew nearer to Doris and him and the truth, the fiends grew busier within me, and gave my little babe of Hope such a hustling that I well-nigh lost sight of it in the tumult.

I had been away eighteen months, and what might a man not do in that time with an impressionable young girl who had the best evidence that her lover was unfaithful? They were cousins, and had been together in earlier years; he was a highly educated, and, contrasted with me, a brilliant, perhaps a fascinating man. He had secured his diploma; but the arduous study had broken him down, and to recruit himself, he had left his London home to pass some weeks among the breezy hills of Worcestershire, the guest of his father's sister, the daily companion, no doubt, of Doris. He had seen her beauty, her young susceptibility to the influences about her, and he had wormed his way into her heart and cankered it, as grubs do roses. So hatred totted it all up and made me feel as murderers do. God forgive me! It is all passed now, and it was love's doing with all three of us.

It was past midnight when I arrived after ten days at Worcester. The old city was slumbering, and the great cathedral was watching over it, and telling out the hours to its deaf ears as the fly rumbled noisily to the hotel, where I had perforce to stay till daylight enabled me to continue my journey by the early train.

I lay on the bed half-dressed, listening to the quarters as they chimed through the silence one after the other, and each time the familiar sounds crossed the current of my thoughts they swung me out of the morrow to other days, which their ringing brought back irresistibly, till by-and-by I allowed memory to have its way entirely, and I lived again in the halcyon summiness of bygone years. I closed my eyes to look at it all, and allowed it to float dreamlike and as it would, till patches of grayness came, and a fading of colour and form, and I was fast asleep.

But as I lay like any log, and the hours went on, till all in the city but myself could hear the cathedral clock ring them out, some part of my brain woke up, and finding reason still a sluggard, started straightway a-dreaming. It was a queer

medley for the most part, and no better than other fantasies of the sort; but to this day I remember it more as a real thing than a trick of the brain, if such it was. There in the darkness of the prairie was the deep red rose that Doris had given me, borne by an army of fireflies, in whose united radiance the flower lay on a hammock of golden threads and flitted before me mockingly while I stumbled in chase of it. Ay, it was the rose, and it blushed in the embrace of Doris's own hair. I had seen it shine so at sundown when the light got in it and made it luminous with a gold not its own, as the grass blades seem shafts of emerald fire when the glow-worms are among them. The phantasm rose and fell in the blackness, while the hundreds of little light points made a shifting circle round. On, on they flitted, ever eluding me as I stumbled along, till there was a sudden clash of bells, when the little vision dissolved into a kind of crimson and golden atmosphere, in which I laved myself with beating hands, while it widened more and more, lighting all things round, till I saw that I stood in a crowded churchyard in all the soft sheen of a summer's morning. I rubbed my eyes as the people moved about, some towards the wooden porch, some taking places on the path, till there was an avenue of smiling faces and one slim figure, followed by her maids, wending slowly through all.

It was Doris, all white and beautiful in bridal vestments; but her golden head was bent, and there was heaviness in her step. As if she were entering some prison-house, never to know liberty again, she paused at the porch, and looked long and wistfully back into the sunshine. And I could see the thin face and the pain deep down in her eyes, knowing all the meaning of her long look, but unable to move, as she passed in and out of my sight. Then the clanging of the bells died away into a melody of old time, which they quaintly chimed, while the people thronged into the church, leaving me alone among the headstones. The agony was too much. I wrenched free my voice and shrieked her name—and awoke, still hearing the chiming, but realising gradually that it came from the cathedral tower, which I could see in the morning sun over the house-tops, and its clock pointed to three minutes past nine.

Now I never believe in dreams; but I sat down to breakfast uneasy and without appetite, looking in at that despairing white face with a growing sense of its ominousness, and chafing mightily at the fact that there was no train to take me on for another two hours.

'Paper, sir?' I heard the waiter say as I trifled with the toast. I dropped my eyes mechanically on to the folded sheet; but only looked vacantly at it, or rather a headline, which, standing out from the rest, took my eyes, being definite, as the fire is in the darkness, or a candle flame, which we gaze at without noting. There was the name of my own village staring me in the face, and for a full minute I never saw it—Ranston-in-the-Vale. It was all a flash, as was my eagerness as I snatched up the paper and read the local items: 'Bellringers' Dinner—Fire at the Hall—The Approaching Marriage of Dr Robson.'

I remember the sense of paralysis, the rush of darkness to the eyes, and then the sudden return

of light as I jumped to my feet and stood a moment irresolute, with my watch in my hand. Quarter past ten—the ceremony was at eleven—three parts of an hour to do fifteen miles. A wave of helplessness swept over me, and then of hot strength—nothing less than the strength of despair, and, thank God, it carried me through.

I shall never forget that ride. The horse was fresh—the pick of the best posting stables in Worcester—and I had much to do to keep it in while we breasted Redhill to the level of the London Road. Then I gave it its head and a tip from the heels, and away we shot like two mad things. Seeing nothing but the yellow road before me, I counted every spring of the animal as he skimmed along, scarcely seeming to touch the ground with his light hoofs, and flying faster and faster as he warmed to it and heard my cries of encouragement. For half an hour I let him go, till we came to a stiff hill not three miles from Ranston. Here I pulled him up and made him walk before the final rush in. He was impatient to get on, so was I, for from the top of the hill I knew I could see the church, and maybe some of the gathering people; but I held him in and took out my watch. My heart sank—it was two minutes to eleven. I eased the reins with a shout, and in three bounds we were at the hill-top and away again. I could see the church now across the valley, and the flag at its tower, and the pigmy forms moving about the yard. But there was still hope, still a chance to snatch Doris back from her peril—for such was my purpose, and my dream had made me desperate. I set my teeth and let the good horse go.

It was all over in ten minutes, and it was Doris's doing as much as mine. She could not keep it, maybe, and it was rather sudden to jilt a man just as the vicar was asking whether she would have him or not. But so it was; and I had no sooner shown myself at the vestry door by which I had entered than she saw me, and with a 'Oh, Jack, Jack!' stumbled towards me, and fell limp in my arms, and lay there like a cut lily and as speechless. I had carried her into the vestry, and was bathing her temples with the parson's drinking water before the wedding party could realise what had come to them. *He* was the first to rush in, as was natural perhaps.

Now I would not have harmed him just then, for all his wordy spleen, if he had not laid rough hands on me as he tried to force me from my place. But when the shock of his touch went through me, I laid Doris's head down for one moment while I sprang to my feet, and, catching him by the collar and the small of the back, pitched him out of the open door with such good-will that he fell on the grass a dozen yards away and lay there, a huddled heap of blackness on the green.

When I turned round, Doris was opening her eyes and looking up at her mother, asking where she was. I knelt and looked down at her; she stared while you might count three; and then her arms were round my neck, and I raised her in mine.

'He declared his love here at this wicket, as you had, dear, before him.'

'But the letter?' I said.

'Oh, how could you believe it, Jack? The letter was my second refusal, sent a week after he had taken to his practice. He must have forwarded it to you in the cover of one of mine. How cruel and wicked of him! And you!'—She looked up, and there was such reproach in her eyes that I turned mine away, not daring to meet them.

'Jealousy made a fool of me, Doris. How can I tell it you? You see, the letter was so worded, that, coming after your silence and on top of my knowledge that he was still at Ranston, I'—

'Who told you he was still here? I avoided the subject for your sake.'

'Ill news travels fast; but don't let us speak of it. He allowed the parcel to reach you—what did you think when you opened it?'

'When I was able to, I wrote you, asking what it meant,' she said simply.

'And I never answered?'

'No.'

I gazed at her nearly choking. What had my suffering been to hers?

'And oh, I was so wretched, Jack,' she went on in her naive way; 'and when he came a third time, full of sympathy, and offering to relieve poor mother of the debts which had nearly brought the old home to the brink of breaking, I—I said yes, feeling that I had no will—that it was a duty thrust upon me.—But it is all past now, isn't it?'

Gladness made her sigh, and I could feel her sweet breath as she looked up at me.

'Do you forgive him, then?' said I, looking away, and thinking of his abject figure as he writhed under my whip an hour ago.

'Yes, yes, Jack! and you must too. You have punished him enough, and he has promised to go away. Let us forget him—let us look upon it as a bad dream. Oh, Jack, my heart nearly runs over with its gladness—surely yours has sought else in it now.'

'God bless you!' said I.

'And you, Jack!' said she.

And then we joined hands and turned to the house, becoming one in love and charity, Doris and I.

ABOUT STICKLEBACKS.

THE rivers and streams of England and Ireland teem with fish of various kinds, from the salmon to the minnow; yet I doubt if any species affords such amusement and is such an object of interest to the student of Nature as the homely Stickleback. They are everywhere to be found in rivers, ponds, and streams, and even have their cousins in the sea itself. If you like to study the habits of these hardy little creatures, which are ever so much more interesting and quite as pretty as the gold and silver fish which some time ago were so much sought after, any naturalist will procure them for you, or, better still, if you live in the country, you can catch them for yourself in almost every stream or piece of water of any description.

The writer has kept them himself for many years, and never tires of watching their pretty gambols. For the benefit of those who are not acquainted with the appearance of this little fish,

I will give a short description of it. The common stickleback rarely exceeds two and a half or three inches in length, and is in winter of an olive colour above and a silvery white beneath. This colour is retained by the female all the year round. In the male, however, in the spawning season it changes to a mingled blue and green above and a bright red underneath, extending from the gills, which are the reddest part, backwards for a short distance. The eyes of the male also turn from their natural dark colour to a pale blue. Altogether, it would be hard to find anywhere a prettier little fish than the stickleback at this time. In both male and female are found the little spines on the back, which in the common kind number three. But in some varieties, a specimen of which I have caught, the number of these spines is ten. These, however, are smaller than those of their more common brethren; and indeed the little fish themselves rarely exceed two-thirds of the length of the common variety. They are, as a rule, also darker in colour. Another species, the fifteen-spined stickleback, almost exclusively inhabits the sea. These are the largest kind, being from four to six inches in length.

The natural food of the stickleback consists of worms and water insects, of which it can consume a great number; but if very hungry, it will eat bread and attack and try to feed upon almost anything that comes in its way. Their favourite haunt is under the hollow bank of some small stream; and they especially love a shady place, where the lesser roots of some tree have grown through the overhanging bank down to the bottom of the water; here they find shelter and conceal themselves, except in the spawning-time, when they resort to the larger ponds, where the water is nearly still.

The eggs of this fish when laid are of a globular form, about the size of the head of an ordinary pin, and are generally in a clump, which closely resembles a piece of colourless and transparent jelly dotted over with minute black spots. The sticklebacks when first caught and put into a tub or vessel of some sort, swim in a compact shoal, as if exploring their new domain; but soon, if the vessel is large enough, one little fellow will take possession of a particular corner, and woe to any of his neighbours who should venture too near the boundaries of what he considers his property! His example is, if space permit, followed, and the tub is soon divided into separate houses, as it were. One perhaps prefers a shell and its neighbourhood for his abode; another, a clump of weeds; another, a little gravelly corner; and so on. But the owner of the shell strongly resists the trespass of his weedy or gravelly neighbour, and *vice versa*. Even the females are sometimes attacked, but, as far as I know, never retaliate or try to fight with the males. However, a tract in the centre is left untenanted, and forms the meeting and feeding ground of the assembly.

The sticklebacks become more interesting towards the beginning of summer, which is the spawning-time, when the gills and under part of the head of the male turn to a brilliant red. They are at this season very pugnacious and revengeful; sometimes the fights in which they are always engaged are over after a pick or two;

but I have known a battle of this kind between two particular males continue off and on for days. One of the most curious facts about these little fishes is that after a fight the colour of the gills of the victor becomes if possible a more vivid red, while in the case of the vanquished it pales off to a shade of pink. The males generally fight among themselves until the supremacy of one has been acknowledged. This hero may be easily recognised, even by a person not intimately acquainted with their habits, by the beautiful blue and green shades on his back and sides being far more brilliant and varied than those of his companions, as well as by the similar pre-eminence of the colour of his gills. He is by far the most handsome of the whole community, and he seems to know it, and 'bosses the show' with all the pleasure in life.

But the subjects of this monarch are not always as obedient as he would have them; so there are sometimes fights, and although he may in the first few battles sustain his reputation, it is not unlikely that he will ultimately be overthrown, and a new despot take his place. The happy winner is not, however, allowed to reign in peace or retain long his seat of office; but in his turn is deposed, and compelled to take up a second or even third rate place. The fights of these little animals ought to be enough to satisfy the most exacting lover of novelty. They are conducted in many different ways, one of the chief being an irregular guerilla-like warfare, in which every advantage is taken of the nature of the ground, of shells, weeds, and stones. I have seen a male stickleback remain in ambush among some green weeds until his rival all unsuspectingly swam slowly up near his hiding-place, and then, suddenly dash out and catch the other by the tail, or else strike him with all his force on the side. Sometimes the victim of this clever scheme would see the trap laid for him in time, and would go past, metaphorically, with colours flying, and swim with such speed that his enemy would miss his chance. At other times he would adroitly avoid the onslaught of his antagonist, and quickly turning, be lost to view in the weeds which had lately sheltered his opponent, there, in his turn, to lie in wait for another, or perhaps the same rival. I have also seen these cunning little fellows take advantage of a shell which had been placed in with them, and conceal themselves in or behind it till the moment for action should arrive.

But that is only a specimen of one, perhaps the chief, of their ways of fighting; if they are placed in a globe without any means of concealment, they will attack one another openly. One will make a dart across the entire breadth of the globe, and if his intended victim is quick enough, gets nothing for his pains but a sharp rap against the opposite side of the glass. Nothing daunted, however, he will turn and chase the other hither and thither round the whole area, striking him whenever and wherever he can, and will continue to do so until he is tired, or until he is himself forced to flee. They will not only fight with their own species, but if a minnow be placed with them, they will attack it with common consent, using both their mouths and spines, and will pursue it so vindictively, that soon the minnow will sink to the bottom, half-torn to pieces and

in a dying condition. In fact, they are perfect Ishmaels in their way of indiscriminately attacking any fish which is placed with them.

The stickleback not only uses his mouth and spines as weapons of offence, but is also provided with some means of defence. These consist of the hard bony substance which underlies the body from the gills to the stomach, and forms a veritable breastplate of lateral plates, which in the common stickleback extend about half-way down the body, but in some varieties reach the tail; and of two little spines, which, when not in active use, lie along the sides. These, however, when their owner is attacked, stand out quite rigidly, and are an effective piece of defensive armour. These spines are found both in the male and female, and closely resemble those on the back, except that they seem to be lined with red. This red is not noticeable when they are at rest, but is at once seen when they engage in a battle or dart at an insect.

The colour of the female stickleback is the same all the year round, and the only spot of bright colouring about her is the red lining of these defensive spines. The stickleback is very voracious, and it is amusing to see them attack and swallow the worms which are thrown to them. I have seen one little fellow devour a worm as large as himself, and swim about afterwards seeming nothing the worse for it. Perhaps the funniest sight of all is a little stickleback who has tried to swallow a worm which is too large for him, and who swims about with the tail of the said worm sticking out a quarter of an inch in front of him. Another soon tries to get the worm for himself, and then another; so that in a short time either the first possessor will have to disgorge the tempting morsel, or else run the chance of being half pulled to pieces; and I have often found, on coming down in the morning, one of the pluckiest of the little fellows lying stiff and stark at the bottom of the water with all its spines erect, and with its mouth held open by a half-swallowed piece of worm which had choked it.

Once when I had rather a large number, I discovered that they were disappearing faster than their voracity and pugnacious proclivities could account for. On keeping watch one day, I found that a pet jackdaw of mine, after making sure that the coast was clear, had got up on the edge of the tub and was deliberately waiting to see if any of the little fishes should come to the top of the water. Soon one did come up, and then the jackdaw, with a quick dart of his beak, picked him out of the water and hopped off. I found out afterwards that he ate them; though, how he managed to do so, spines and all, I can't comprehend. After that, I took summary measures to prevent the further diminution of my stock.

Sticklebacks build a very pretty nest, in which the female lays the eggs, while the male keeps the tract of water—which, I suppose, he regards as his rightful domain—free from all would-be intruders, whom nothing would delight so much as a feast of the eggs of their neighbour. Unhappily, my sticklebacks have never built a nest; I am not sure that they will do so in captivity—so I cannot give a detailed account of their manner of constructing it.

In conclusion, I would say to any one who wishes to get the maximum of amusement for the minimum of trouble, 'Just try keeping the hardy little stickleback.'

THE MONTH:

SCIENCE AND ARTS.

THE coming World's Fair at Chicago promises to outdo all previous exhibitions of an international character, and from the reports as to progress constantly published by the authorities, it would seem that the 'fair' will comprise hundreds of ordinary Exhibitions comprised in one. The British Government, we are glad to learn, have increased their grant from twenty-five to sixty thousand pounds—a welcome addition, which enables the Commission to cancel all charges for space. We may feel sure that this act of encouragement to British exhibitors will have a stimulating effect.

As an instance of the vast scale upon which the Chicago Exhibition is planned, we may mention that the department of 'Mines and Mining,' which is to have a distinct section of its own, will occupy a building which has a floor-space of nine acres. This will contain 'the largest array and most complete and instructive evidence of the mineral wealth and progress of the mining industry ever collected or attempted.' Here will be shown some wonderful specimens of mica or talc from Idaho, where natural ledges eight feet thick are found of that curious mineral. It is said that sheets of it twelve inches across, without a single flaw, are not uncommon, and there is some idea of using it in the windows of the mines building in lieu of glass.

Novel features are constantly being added to the wonderful electrical display at the Crystal Palace. One of these is an electrical fire-engine by Messrs Siemens, which at the touch of a switch sends a powerful stream of water one hundred or more feet in height, which would make short work of a minor conflagration, and would certainly have a marked effect upon a more serious one. In another part of the building a number of interesting new experiments are made with electrical currents of enormous strength, the effects in some cases being alarming in their intensity of light and noise.

Messrs Carwardine and Company of the City Road, London, are producing electric light from wind-power. On the roof of their premises is erected a Halladay windmill, which at a distance looks like an enormous wheel. To this is geared a dynamo machine, which delivers the electric current it generates into accumulators or secondary batteries, and the power thus stored is used for lighting purposes. This plan has before been adopted in America; but we believe that this is the first installation of the kind in Britain. At a period when the old wind and water mills for grinding corn are fast becoming obsolete through the introduction of improved machinery, this revival of a past method of obtaining motive-power is extremely interesting.

The Congested Districts Board, in their endeavours to develop the fisheries on the west coast of Ireland, were enabled last month to report a most gratifying and promising first result of their labours. They had engaged a number of Arklow boats to undertake the mackerel fishery, and had made the necessary provision of an ice hulk and other appliances. Arrangements were also made with steamboat and railway companies to convey the fish when caught as quickly as possible to the English markets. The mackerel were rather long in coming, owing, it is supposed, to the coldness of the season, but they eventually made their appearance; and on the 6th of April, six thousand five hundred prime fish—the first Galway mackerel ever imported to an English market—were sent to London. In addition to these arrangements, a Norwegian has been engaged to instruct the natives in the art of fish-curing. The people are working hard, and seem to be delighted at the novelty of finding a market for their fish.

During some recent excavations for main-drainage purposes at Endsleigh Street, in the north-western district of London, the workmen, at a depth of twenty-two feet from the surface came upon the remains of a mammoth and other prehistoric animals. A portion of one of the mammoth tusks on being brought to the surface was found to measure at its thickest part two feet in circumference, and the probable length of the tusk in its original state would be about ten feet. The loamy soil in which these remains were found also yielded many seeds of plants which were contemporaneous with them, and which have since been found to consist of twenty species. From these it is learnt that the land was at the period indicated of a marshy nature; and as certain other deposits were found overlying these remains, the geological age during which the animals lived may be included in what is known as the glacial period. At least such is the opinion of the Hon. Secretary of the Geological Society, to whose scrutiny the specimens have been submitted.

The Wellington Monument in St Paul's Cathedral, the work of Alfred Stevens, is by many considered to be the finest piece of monumental sculpture ever produced by a British artist. But at the time it was produced it was not appreciated by the Office of Works, nor by the Dean and Chapter; and instead of being placed in the position for which it was designed, it was hidden away in the side chapel where it now stands. Moreover, the equestrian figure which was intended to crown it was never placed in position, because the all-powerful Dean would not permit 'the Duke to come riding into Church on the top of his own Monument.' Sir Frederick Leighton has now interested himself in the matter of this noble sculpture, and it is now decided that it shall be removed to the site for which it was originally intended—under the easternmost arch on the north side of the nave—and that the equestrian figure shall be completed and placed in position. The removal of the Monument will cost one thousand pounds.

A series of deep-sea explorations have recently been conducted in the Mediterranean, under the auspices of the Austrian Government, by a scien-

tific party on board the ship *Pola*. The two deepest soundings taken were at a point about fifty nautical miles south-west of Cape Matapan, one indicating a depth of 2236 fathoms, and the other 2406 fathoms, each being equivalent to a depth of more than two and a half miles. Some two years ago, similar explorations were made, when it was found that the density of the water and its saltness increased with the depth; and the same thing was noticed with regard to the western portion of the Sea during the recent soundings. But in the Eastern Mediterranean the density between the various strata does not show so much variation. The water is said to be of wonderful transparency.

From a Report by the British Vice-consul at La Rochelle, dealing with the agriculture of the Nantes district, we learn something with regard to the working of a horse-breeding establishment at Saintes. Very strong views, we are told, are held in France as to the importance of any defect in the breathing organs of horses, and the smallest indication of anything wrong at once disqualifies an animal, whatever be his value in other respects. This is because those in authority are convinced that such diseases are hereditary, and it must be said that they have every opportunity of testing their theory. For the most careful returns are kept of the parentage of each horse reared; so that defects of any kind can be traced to either side.

The Dean of the Dental Hospital of London has done good service in warning the public against the numerous circulars, pamphlets, manuals, and other advertisements, by so-called dentists, which nowadays find their way into so many houses. Many of these advertisers, he tells us, are without a dental qualification or any hospital training, and as a result, a large amount of malpractice is daily carried on. He then proceeds to give the information by which the public may be able to judge between a qualified and unqualified practitioner. More than thirty years ago, the Royal College of Surgeons instituted a curriculum for dentists, consisting of two years' hospital training, and three years' study in a dental laboratory. After passing an examination, the student is placed upon the Dentists' Register, and can write L.D.S. after his name. At the end of the Medical Directory will be found a list of dentists so qualified, together with the appointments which they hold. The public, therefore, can avoid with very little trouble treatment by those who are often as likely to injure as to benefit them.

A writer in the American periodical *Electricity*, in referring to the search-light as used in the United States navy, says that in order to make a thorough examination of the ocean surface round about a ship, the light must not be rapidly revolved, but slowly—so slowly that between the flashes upon the different sections of the water, there is the danger that a quick torpedo boat would have time to run in and do damage. (A boat of this description will run two miles in five minutes.) To obviate this difficulty, he suggests that each vessel shall be furnished with a number of lights, each patrolling and illuminating its own particular section of surface. The vessel by this means would be surrounded by a complete circle of light.

The Homacoustic Speaking Tube is a great

improvement on the common form of instrument used in offices. Instead of a multiplicity of separate call-tubes, each with its whistle, the Homacoustic has only one mouthpiece, with a simple form of commutator attached, by which it can be readily connected with any communicating tube in the building. It is fitted with a pneumatic arrangement which obviates the somewhat disagreeable business of blowing down the pipe. The earpiece or receiving part of the instrument is distinct from the speaking tube proper; and for very noisy situations, such as workshops, shipboard, &c., there is a tube for each ear, so that all external sounds are for the time shut out. The system, from what we have seen of it, is far more comfortable and convenient to work with than the telephone, but of course its range is more limited.

There are so many amateur weather observers throughout the country, who, among other observations, make periodical notes with regard to rainfall, that a report of some experiments made in this direction by Professor G. Hellmann will be of widespread interest. An account of these experiments is contained in the annual Report for 1892 of the Berlin branch of the German Meteorological Society, and deals with the effects of exposure on rainfall records, and with the distance apart at which gauges should be erected, in order to give the most accurate results. After experiments extending over seven years, Professor Hellmann has found that considerable differences in the amount of rainfall are recorded at stations comparatively close together. This is attributed to the action of wind, and especially to snow; the more a gauge is exposed to wind, the less rainfall will it record, and the higher its position—owing to its greater exposure to wind—the less the record. The common instruction, to place the gauge in as open a situation as possible is therefore incorrect; but it will work well, even in an elevated position, if it be protected from the wind. He has noted differences of five per cent. in the records of neighbouring stations even in a flat country; and in stormy weather the difference may sometimes amount to one hundred per cent. Further experiments are needed, as the ones cited, although carried on for so long a period, are by no means definite in their results.

What has always been supposed to be a mere cenotaph, or empty tomb, is the beautiful shrine in Gloucester Cathedral erected to the memory of Osric, king of Northumbria, who died 729 A.D. The present Dean of Gloucester, guided by a passage in Leland's Notes—written in 1540—to the effect that the body of Osric, founder of Gloucester Abbey, after being moved twice, had finally 'been layed under a fayre tombe of stone on the north side of the high altar,' has lately had the tomb carefully examined. Upon taking out two of the stone panels, a long coffin was disclosed, lying exactly beneath the king's effigy. If, as there is every reason to believe, this should be really the remains of Osric, Gloucester will be able to boast that it holds the guardianship of the oldest known remains of the Saxon kings. Thus another point of interest is added to one of the most beautiful of our cathedrals.

The immense consumption of oysters and clams in and around the city of New York has led to an industry of which, perhaps, it would be

impossible to find a counterpart elsewhere. Instead of allowing the shells to accumulate in heaps, like the kitchen-middens of prehistoric savages, they are manufactured into quicklime, and the industry is by no means an unimportant one. The shells are burnt in huge kilns of oval section, having a grating at the bottom. Upon this grating is first of all started a coke-fire, above which is placed a stratum of shells about one foot in thickness. Over this is placed a layer of coal-dust, then shells again, and so on up to the top of the kiln. The initial fire gradually creeps through the porous mass, until in about seventeen hours it reaches the top, when the resulting quicklime is withdrawn from below, and is ultimately used for gas purification, as well as by farmers and soap manufacturers. Seven different firms in New York City and Brooklyn turn out among them between four and five million bushels of this shell-lime yearly. We glean the foregoing particulars from the *Scientific American*.

First aid to the victim of an accident is very often the only aid that can possibly be of service to him, and it is generally the case that the help, to be efficient, must be prompt. Especially is this so in cases of drowning, when often the life-saving contrivances are of too cumbrous a nature to be portable, or are locked up out of reach. A pocket life-saving contrivance is a novelty to us, although it has been in use for two years in various parts of France, and has been instrumental in saving many hundred lives. This is the Brunel Apparatus, which consists of a bobbin of fine but very strong cord, with a wooden float at one end, and a little four-pronged iron grapnel at the other. If the drowning man fails to grasp the floating part, the other end is thrown towards him, so that the points of the grapnel may catch his clothing, and he can be drawn out of the water. Custom-house officers and others engaged about quays and harbours in France carry the Brunel apparatus in a leather pocket-case, and when a man goes off duty he hands it to the one who relieves him. This useful apparatus is described and commended in the last Report of the British Vice-consul at Dieppe.

In an interesting paper read by Dr Richard Ellis before the North of England branch of the British Medical Association, the far-famed baths of Laurvik (Norway) were fully described. Laurvik is a town situated about seventy-six miles from Christiania, in the midst of most beautiful scenery. The baths were founded some twelve years ago by Dr Holm as a sequel to the discovery in the neighbourhood of both sulphureous and ferruginous springs. Among the resources of the establishment are found baths of compressed seaweed liquor, rich in iodine; sulphur baths direct from the spring, but artificially heated; fir-leaf baths, cold sulphur swimming baths, and sea and mud baths. The treatment of a patient in the last named the doctor witnessed, and the description which he gives is not altogether an inviting one. The mud is black, of the consistence of cold cream, and has an odour—well, unlike that of roses. The patient is rubbed all over with this unpleasant compound, and is finally made clean once more in a warm shower-bath.

The United States Consul at Jerusalem has

recently described the method of irrigation pursued in the orange groves at Jaffa, where about three thousand acres of ground are under cultivation. Although the orange and lemon form the chief crops, peaches, grapes, melons, &c. are produced in great abundance. It is a necessity that the orange groves should be watered during the dry season—that is, from May until October—when no rain falls. This is done by means of wells, which are fed by underground springs, the apparatus for bringing the water to the surface being of the most primitive description, and consisting of a series of wooden beams, wheels, and buckets set in motion by a horse or mule. The rainfall in the winter varies between twenty and thirty inches, and its coming is presaged by that curious atmospheric phenomenon known as the 'air-cushion.' Before the first rain comes, heavy masses of cloud roll up and cover the sky; and when they at length give up their rain, the falling water is caught up and absorbed by the dry and thirsty atmosphere before ever it reaches the earth. This goes on until the intervening strata of air become saturated, when the real deluge commences, often with injurious consequences.

Spiral springs of steel wire, which are plentifully used at the St Etienne gun factory, are now tempered by electricity. A current of the necessary strength gradually to heat the metal is passed through the spring, and when the right temperature is reached, the current is switched off and the spring dropped into a tank of water. By means of this method, a single workman can temper with unfailing accuracy between two and three thousand springs per day.

SONNET ON JUNE.

MONTH of the sunny skies, and woodlands bright;
Of roses glowing with a thousand hues
When earth once more her summer joy renews;
When birds are singing, and when hearts are light;
When the sun lingers longest, and the night
Is but a star-gemmed veil, dawn sighs to lose,
Fragrant with rose-breath, wet with moonlit dews,
 wooing the thought to yon empyreal height,
To that fair world where the June days endure,
Where chill winds never come, nor autumn steals
Green from the leaf or crimson from the rose.
Oh month of roses! promise sweet and sure
Of that which waits us, thy rich bloom reveals
The perfect beauty heaven shall yet disclose.

MARY GORGES.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL*.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

MODERN PLAYWRIGHTS AND THEIR METHODS.

THERE is no branch of literature that has the same fascination for men of letters as playwriting. This is not astonishing, when one remembers that Shakespeare wrote for the stage, and the natural desire that must exist to emulate him; besides—and this, perhaps, is an equally powerful incentive—the amount of money earned in this calling far exceeds that made by authors in any other branch of literature. It is not uncommon for a dramatist to be in receipt of a hundred and twenty pounds a week from one theatre in London alone during the run of a successful piece, and the same author may have two or three such pieces running at the same time in the metropolis, as well as perhaps a dozen in America and the provinces.

It is a curious fact that our most eminent authors of modern times have almost invariably failed in dramatic work. In the case of a novelist this is not difficult to explain, the methods of construction being so dissimilar. Not only has he to learn a new art, but he is hampered by the knowledge of the art he knows. To take an example of this: in novel-writing, a great secret of success lies in the power to hoodwink one's audience—in a play the very reverse is the case, one must never deceive for a moment. But our poets have been as unsuccessful as our novelists. Plays by Browning or Shelley are never produced without the aid of their respective Societies; and though some of Lord Tennyson's pieces have certainly appeared at the Lyceum, it would be stretching a point to call him a successful playwright. Byron, Wordsworth, and Keats have also written plays, but venturesome indeed is the manager who puts them on the boards.

The men who claim our attention above all other modern dramatists from the literary point of view are undoubtedly the late Mr W. G. Wills, Mr W. S. Gilbert, and Mr A. W. Pinero. No two men could be more dissimilar in their natures and in their methods than Wills and

Gilbert, yet, curiously enough, these two went hand in hand some twenty years ago, in introducing blank-verse plays to a stage almost entirely given up to burlesque. Wills, as the older man, was the pioneer, and started writing some ten years before Gilbert; but it took nine out of these ten years for him to obtain a hearing. In later years, Gilbert has almost entirely given up writing poetic dramas, having found a so much richer vein of gold in comic opera; but he has always been indignant with a public which insisted upon treating him as a humorist only. Wills remained a blank-verse writer to the day of his death, his last great work, written a year or two ago, on the subject of the Arthurian legends, being now in Mr Irving's possession, and shortly to be produced at the Lyceum. Those who have had the pleasure of reading this play in manuscript pronounce it to be the best of his creations, and even more beautiful and pathetic than his *Charles I.* or *Olivia*.

W. G. Wills was born at Castlecomer, County Kilkenny, in 1828. He was a student at Trinity College, Dublin, but never graduated. Still—and in his case this was perhaps of more importance—he gained the Vice-chancellor's prize for English verse. It is not generally known that he was an artist; but before he became engrossed in dramatic work, he was one of some eminence, and painted several members of the Royal Family. His 'Ophelia and Laertes,' one of the most beautiful of modern pictures, shows clearly that he would have been one of the first painters of his day had not circumstances altered his career. In character, Wills greatly resembled his fellow-countryman Goldsmith—in fact, he was a thorough-going bohemian of so pronounced a type, that his living in the nineteenth century struck one as being almost an anachronism. He was also a man of genius, and, as Carlyle says of men of genius, he made his own atmosphere. He was very unmethodical in his work, and would write like Pope on the backs of envelopes or any scraps of paper that might be lying handy. These scraps were attached together anyhow,

and were usually thrown into a large wickerwork clothes-basket till the play was finished, when they were sorted out and copied by some one of his friends. He never kept a regularly paid secretary, but always had a host of admirers, who were only too ready to write to his dictation, and so feel, like the Indian servant Kipling so amusingly describes in his preface to *Black and White*, that they had a hand in the work. The result of these erratic habits was that Wills constantly mislaid his manuscripts; in fact, on more than one occasion lost them completely. I remember once I unearthed from an old box that served the purposes of a dust-bin three acts and part of the fourth of a play called *Merry and Wise*, which is still unacted. When I showed it to Wills, he was greatly delighted. 'My dear fellow,' he exclaimed, 'you have done me the greatest service in the world. This is one of the best plays I ever wrote, and I thought I had lost it years ago.'

Perhaps no literary man ever chose more extraordinary places than Wills for the purposes of composition. His favourite place, and the one in which he always used to assure his friends his best work was done, was a warm bath. Warm baths being not always procurable, and if indulged in too much, being somewhat unhealthy, Wills would betake himself to bed as being the next most congenial place, and would, when the humour seized him, lie there for days writing. The greater part of *Charles I.* was composed in bed; and about the writing of it, he used to tell an amusing story. The fourth act, which, as originally written, dealt with the execution of the king, was not approved of by Mr Henry Irving, who suggested the germ of the act as it now stands. Wills was delighted with the new idea, and went to bed immediately full of poetic ardour. In the course of the day his landlady came up to see him, and was much upset when she saw the state he was in—tears were coursing down his cheeks, and he looked the picture of misery. 'It was with great difficulty,' said Wills, 'that I persuaded her that I was not suffering from some personal bereavement.'

Wills was never able to write the pathetic passages in his plays without crying like a child, and on this occasion he was writing the king's farewell to his wife, before being led out to execution. One has only to read the passage to see the composition of it must have occasioned the deepest feeling:

Oh, my loved solace on my thorny road,
Sweet clue in all my labyrinth of sorrow,
What shall I leave to thee?
To thee I do consign my memory!
Oh, banish not my name from off thy lips
Because it pains awhile in naming it,
Harsh grief doth pass in time into far music,
Red-eyed regret that waiteth upon sorrow
Will daily grow a gentle, dear companion,
And hold sweet converse with thee of thy dead.
I fear me, I may sometime fade from thee,
That when the heart expelleth gray-stoled grief,
I live no longer in thy memory.
Oh, keep my place in it for ever green,
All hung with the immortelles of thy love,
That sweet abiding in thine inner thought,
I long for more than sculptured monument
Or proudest record 'mong the tombs of kings.

In contrast to most dramatists, who generally

write in the evening, Wills was in the habit of beginning work as early as five in the morning and continuing till noon. He rarely did any writing after twelve, when he would adjourn to his studio and paint till dusk. Wills never wrote his plays straight through from beginning to end: after completing the *scenario*, he might begin writing the last scene of the last act, or he might begin in the middle or any other part of the work as the whim seized him. If there were any method in his madness at all, it lay in the fact that he liked to get the important scenes done first, but he was not regular even in doing this. He rarely corrected his work. If the inspiration did not come at the proper time, he either laid the play on one side or did it very badly. Some of his most beautiful lines were written straight off, and never altered—all he seemed to require was a pencil and a piece of paper. He had the greatest contempt for matters of detail, and his characters or their position on the stage at any given moment were simple matters of imagination to him as he sat in a chair. He much disliked realism. In this and other phases of his character he was distinctly opposed to the scientific attitude of the day. His contemporaries, with few exceptions, have distinct models for their characters, which they study microscopically from life; and since Sardou first conceived the idea, they even construct miniature theatres, which are an exact model of the stage as it will appear when the piece is finally produced.

It is well known that Gilbert has one of these model theatres, also little blocks of wood, representing the characters, the men being a little taller than the women, which he can move about at will. Sardou, indeed, is so particular about accuracy of detail, that if he lays a scene of any of his plays in a particular town, he will pay a visit to that town and make a plan and take measurements, so that the spots represented are in exact proportion to their actual size, even to the breadths of the streets and the heights of the houses.

Owing to Wills's carelessness in these matters, it is extremely doubtful if his plays would have been as successful as they were, had it not been that, with few exceptions, they were produced by managers who were perfect masters in their own art. This no doubt accounts for the fact that Wills, after finishing and despatching a play, took very little further trouble, and rarely attended rehearsals.

Gilbert is as careful in rehearsing a piece as he is in composing it, and in carefulness of composition and minuteness of supervision during rehearsal. A. W. Pinero is almost as exacting. The latter's method of work is, however, in many respects different. Instead of preferring an arm-chair in a quiet study of his own, as Gilbert does, Pinero is known to compose best in the smoking-room of an hotel or any other place where there may be an accompaniment of chatter and noise. A very important difference, too, in their system of composition is this: Gilbert founds his plays upon some isolated idea; in other words, he begins with the plot, and the characters shape themselves from it. Pinero, on the other hand, founds his ideas or plots upon character. His habit is to go down to some country house or

rural inn, and after studying the people there, the plot naturally evolves itself from their characters. To be in the cast of a new play by Pinero is a liberal education to any young actor or actress. Having been an actor himself for many years, he knows thoroughly how his lines should be delivered, and will take the utmost pains to teach a novice how to speak them, however small his or her part may be. It is his habit to sit in the stalls; but he never stays there long. Every few minutes he will run up the orchestra steps and go through the part then under rehearsal, illustrating the business himself, which he thinks appropriate to his words.

With men who are as accurate as most of our well-known dramatists are, quick work is impossible. Pinero seldom writes more than two plays in a year; Mr Henry Arthur Jones, who is also extremely careful, seldom more than one. Wills, on the other hand, wrote very quickly; but his dramatic output was not very great, owing to the fact that he wrote poems and novels as well; besides his artistic work, which occupied no little portion of his time. Probably the most prolific writer in England is Mr Henry Pettitt. He once wagered a man that he would in seven days write, rehearse, and produce a play which would take an hour to act. He not only achieved this, but the play was a distinct success, and is, we believe, running in the provinces at the present time. Nobody knows how to appeal to popular feeling better than Pettitt. The finale of the first act of this play, we remember, roused the audience to frenzied applause. The villain of the piece is requesting the hero to do some ignoble action. 'I cannot,' replies the hero; to which the villain retorts, 'Why not?' 'Because,' the hero answers—and here the curtain descends quickly—'I am an Englishman!'

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXI.—HE COMES FROM EDMUND GRAY.

'NOTHING,' said Athelstan, 'could possibly happen more fortunately. We have turned whispering conspirators into declared enemies. Now you are free to investigate in your own way without having to report progress every day.'

'About this new business about the letters and the things in the safe,' said Elsie. 'It looks to me like *diablerie*. Checkley couldn't do it. No conjurer in the world could do it. There must be somebody else in the office to do these things. They mean defiance. The forger says: "See—I do what I please with you. I return your letters addressed to Edmund Gray. I place placards about Edmund Gray in your safe—for which nobody has a key except yourself. Find me, if you can."'

'Yes; it's very mysterious.'

'A Person on Two Sticks might manage it. Very likely, he is concerned in the business. Or a boy under the table would be able to do it. Perhaps there is a boy under the table. There must be. Mr Dering's table is like the big bed

of Ware. I daresay fifty boys might creep under that table and wait there for a chance. But perhaps there is only one—a comic boy.'

'I should like to catch the joker,' said George. 'I would give him something still more humorous to laugh at.'

'If there is no comic boy—and no Person with Two Sticks,' Elsie continued, 'we are thrown back upon Checkley. He seems to be the only man who receives the letters and goes in and out of the office all day. Well—I don't think it is Checkley. I don't think it can be.—George, you once saw Mr Dering in a very strange condition, unconscious, walking about with open eyes seeing nobody. Don't you think that he may have done this more than once?'

'What do you mean, Elsie?'

'Don't you think that some of these things—things put in the safe, for instance, may have been put there by Mr Dering himself? You saw him open the safe. Afterwards, he knew nothing about it. Could he not do this more than once—might it be a habit?'

'Well—but if he puts the things in the safe—things that belong to Edmund Gray, he must know Edmund Gray. For instance, how did he get my note to Edmund Gray, left by me on his table in Gray's Inn? That must have been given to him by Edmund Gray himself.'

'Or by some friend of Edmund Gray. Yes; that is quite certain.'

'Come,' said Athelstan. 'This infernal Edmund Gray is too much with us. Let us leave off talking about him for a while. Let him rest for this evening.—Elsie, put on your things. We will go and dine somewhere, and go to the Play afterwards.'

They did so. They had the quiet little restaurant dinner that girls have learned of late to love so much—the little dinner, where everything seems so much brighter and better served than one can get at home. After the dinner they went to a Theatre, taking places in the Dress Circle, where, given good eyes, one sees quite as well as from the stalls at half the money. After the Theatre they went home, and there was an exhibition of tobacco and soda water. Those were very pleasant days in the Piccadilly lodgings, even allowing for the troubles which brought them about. Athelstan was the most delightful of brothers, and every evening brought its feast of laughter and of delightful talk. But all through the evening, all through the Play, Elsie saw nothing but Mr Dering and him engaged in daylight somnambulism. She saw him as George described him, opening the safe, closing it again, and afterwards wholly forgetful of what he had done.

She thought about this all night. Now, when one has a gleam or glimmer of an idea, when one wants to disengage a single thought from the myriads which cross the brain and to fix it and to make it clear, there is nothing in the world so good as to talk about it. The effort of finding words with which to drag it out makes it clearer. Every story-teller knows that the mere telling of a story turns his characters, who before were mere shadows, and shapeless shadows, into creatures of flesh and blood. Therefore, in the morning she began upon the thought which haunted her.

* Copyright 1892 in the United States of America by Harper & Brothers.

'Athelstan,' she said, 'do you know anything about somnambulism?'

'I knew a man once in California who shot a grizzly when he was sleep-walking. At least, he said so. That's the sum of my knowledge on the subject.'

'I want to know if people often walk about in the daytime unconscious?'

'They do. It is called wool-gathering.'

'Seriously, Athelstan. Consider. George saw Mr Dering arrive in a state of unconsciousness. He saw nobody in the room. He opened the safe and placed some papers there. Then he locked the safe. Then he sat down at the window. Presently he awoke and became himself again. If he did that once, he might do it again.'

'Well? And then?'

'You heard yesterday about the letters and the placard and the Socialist tracts. Now Checkley couldn't do that. He couldn't, and he wouldn't.'

'Well?'

'But Mr Dering could. If he had that attack once, he might have it again and again. Why, he constantly complains of forgetting things.'

'But the letters yesterday were addressed to Edmund Gray. How do you connect Edmund Gray with Edward Dering?'

'I don't know. But, my dear brother, the more I think of this business, the more persuaded I am that Checkley is not the prime mover, or even a confederate.'

'The same hand has been at work throughout. If not Checkley's aid to make that hand possible and successful, who is there? And look at the malignity with which he tries to fix it on some one else.'

'That may be because he is afraid of its being fixed upon him. Consider that point about the control of the letters. The business could only be done by some one through whose hands passed all the letters.'

'Checkley is the only person possible.'

'Yes; he understands that. It makes him horribly afraid. He therefore lies with all his might in order to pass on suspicion to another person. You and George think him guilty—well, I do not. If I were trying to find out the man, I should try a different plan altogether.'

Her brother had work to do which took him out directly after an early breakfast. When Elsie was left alone, she began again to think about Mr Dering's strange daylight somnambulism: about his continual fits of forgetfulness: about the odd things found on his table and in his safe, all connected with Edmund Gray. Checkley could not have placed those letters on the table: he could not have put those things in the safe.

Elsie looked at the clock. It was only just after nine. She ran to her room, put on her jacket and hat, and called a cab.

She arrived at half-past nine. Checkley was already in his master's room, laying out the table for the day's work as usual. The girl was touched at the sight of this old servant of sixty years' service doing these offices zealously and jealously. She stood in the outer office watching him through the open door. When he had finished, he came out and saw her.

'Oh!' he grumbled. 'It's you, is it? Well

—he hasn't come. If you want to see Mr Dering, it's full early. If you want to see the new Partner, he isn't come. He don't hurry himself. Perhaps you'll sit down a bit and look at the paper. Here's the *Times*. He'll be here at a quarter to ten.'

He sat down at his desk and took up a pen. But he laid it down again and began to talk. 'We're in trouble, Miss. No fault of yours—I don't say it is. We're in trouble. The trouble is going to be worse before it's better. They're not content with robbing the master, but they mock at him and jeer him. They jeer him. They put on his table letters addressed to the man they call Edmund Gray. They open his safe and put things in it belonging to Edmund Gray. We're not so young as we was, and it tells upon us. We're not so regular as we should be. Sometimes we're late—and sometimes we seem, just for a bit, not to know exactly who we are nor what we are. Oh! it's nothing—nothing but what will pass away when the trouble's over. But think of the black ingratitude, Miss—oh! black—black. I'm not blamin' you; but I think you ought to know the trouble we're in—considering who's done it and all.'

Elsie made no reply. She had nothing to say. Certainly she could not enter into a discussion with this man as to the part, if any, taken in the business by the new Partner. Then Checkley made a show of beginning to write with zeal. The morning was hot: the place was quiet: the old man's hand gradually slackened: the pen stopped: the eyes closed: his head dropped back upon his chair: he was asleep. It is not uncommon for an old man to drop off in this way.

Elsie sat perfectly still. At eleven o'clock she heard a step upon the stairs. It mounted: it stopped: the private door was opened, and Mr Dering entered. He stood for a moment in the doorway, looking about the room. Now, as the girl looked at him she perceived that he was again in the condition described by George—as a matter of fact, it was in this condition that Mr Dering generally arrived in the morning. His coat was unbuttoned: his face wore the genial and benevolent look which we do not generally associate with lawyers of fifty years' standing: the eyes were Mr Dering's eyes, but they were changed—not in colour or in form, but in expression. Elsie was reminded of her portrait. That imaginary sketch was no other than the Mr Dering who now stood before her.

He closed the door behind him and walked across the room to the window.

Then Elsie, lightly, so as not to awaken the drowsy old clerk, stepped into Mr Dering's office and shut the door softly behind her.

The sleep-walker stood at the window, looking out. Elsie crept up and stood beside him. Then she touched him on the arm. He started and turned. 'Young lady,' he said, 'what can I do for you?' He showed no recognition at all in his eyes: he did not know her. 'Can I do anything for you?' he repeated.

'I am afraid—nothing,' she replied.

He looked at her doubtfully. Then apparently remembering some duty as yet unfulfilled, he left the window and unlocked the safe. He then drew out of his pocket a manuscript tied up with

red tape. Elsie looked into the safe and read the title—'The New Humanity,' by Edmund Gray,' which was written in large letters on the outer page. Then he shut and locked the safe and dropped the key in his own pocket. This done, he returned to the window and sat down, taking no manner of notice of his visitor. All this exactly as he had done before in presence of George and his old clerk.

For ten minutes he sat there. Then he shivered, straightened himself, stood up, and looked about the room, Mr Dering again.

'Elsie!' he cried. 'I did not know you were here. How long have you been here?'

'Not very long. A few minutes, perhaps.'

'I must have fallen asleep. It is a hot morning. You must forgive the weakness of an old man, child. I had a bad night, too. I was awake a long time, thinking of all these troubles and worries. They can't find out, Elsie, who has robbed me.' He spoke querulously and helplessly. 'They accuse each other, instead of laying their heads together. Nonsense! Checkley couldn't do it. George couldn't do it. The thing was done by somebody else. My brother came here with a cock-and-a-bull case, all built up of presumptions and conclusions. If they would only find out!'

'The trouble is mine as much as yours, Mr Dering. I have had to leave my mother's house, where I had to listen to agreeable prophecies about my lover and my brother. I wish, with you, that they would find out!'

He took off his hat and hung it on its peg. He buttoned his frock-coat and took his place at the table, upright and precise. Yet his eyes were anxious.

'They tease me too. They mock me. Yesterday, they laid two letters addressed to this man, Edmund Gray, on my letters. What for? To laugh at me, to defy me to find them out. Checkley swears he didn't put them there. I arrived at the moment when he was leaving the room. Are we haunted? And the day before—and the day before that—there were things put in the safe!'

'In the safe? Oh! But nobody has the key except yourself. How can anything be put in the safe?'

'I don't know. I don't know anything. I don't know what may be taken next. My houses—my mortgages, my lands, my very practice!'

'Nay—they could not. Is there anything this morning?'

He turned over his letters. 'Apparently not. Stay; I have not looked in the safe.' He got up and threw open the safe. Then he took up a packet. 'Again!' he cried almost with a scream. 'Again! See this!' He tossed on the table the packet which he had himself, only ten minutes before, placed in the safe with his own hands. 'See this! Thus they laugh at me—thus they torment me!' He hurled the packet to the other side of the room, returned to his chair, and laid his head upon his hands, sighing deeply.

Elsie took up the parcel. It was rather a bulky manuscript. The title you have heard. She untied the tape and turned over the pages. The work, she saw, was the Autobiography of Edmund Gray. And it was in the handwriting of Mr Dering!

She replaced it in the safe. 'Put everything there,' she said, 'which is sent to you. Everything. Do you know anything at all about this man Edmund Gray?'

'Nothing, my dear child, absolutely nothing. I never saw the man. I never heard of him. Yet he has planted himself upon me. He holds his chambers on a letter of recommendation from me. I was his introducer to the Manager of the Bank—I—in my own handwriting—as they thought. He drew a cheque of £720 upon me eight years ago. And he has transferred thirty-eight thousand pounds' worth of shares and stock to his own address.'

'Added to which, he has been the cause of suspicion and vile accusation against my lover and my brother, which it will cost a great deal of patience to forgive. Dear Mr Dering, I am so sorry for you. It is most wonderful and most mysterious. Suppose,' she laid her hand upon his—'suppose that I was to find out for you!'

'You, child? What can you do, when the others have failed?'

'I can but try.'

'Try, in Heaven's name. Try, my dear. If you find out, you shall be burned for a witch.'

'No. If I find out, you shall be present at my wedding. You were to have given me away. But now—now—Atheletan shall give me away, and you will be there to see. And it will be a tearful wedding—the tears came into her own eyes just to illustrate the remark—'because every one will be so ashamed of the wicked things they have said. Sir Samuel will remain on his knees the whole service, and Checkley will be fain to get under the seat.—Good-bye, Mr Dering. I am a Prophetess. I can foretell. You shall hear in a very few days all about Edmund Gray.'

She ran away without any further explanation. Mr Dering shook his head and smiled. He did not believe in contemporary Prophecy. That young people should place their own affairs—their love-makings and weddings—before the affairs of their elders, was not surprising. For himself, as he sometimes remembered—and always when this girl, with her pretty ways and soft voice, was with him—her visit had cheered him. He opened his letters and went on with the day's work.

As for Elsie, the smile in her eyes died out as she descended the stairs. If she had been herself a lawyer, she could not have worn a graver face as she walked across the courts of the venerable Inn.

She had established the connection between Mr Dering and Edmund Gray. It was he, and nobody else, who laid those letters on the table—placed those things in the safe. This being so, it must be he himself, and nobody else, who wrote all the letters, signed the cheques, and did all the mischief. He himself! But how? Elsie had read of hypnotism. Wonderful things are done daily by mesmerists and magnetists under their new name. Mr Dering was hypnotised by this man Edmund Gray—as he called himself—for his own base ends. Well—she would find out this Edmund Gray. She would beard this villain in his own den.

She walked resolutely to Gray's Inn. She found No. 22—she mounted the stairs. The

outer door was closed. She knocked, but there was no answer. She remembered how George had found his laundress, and visited her at her lodgings—she thought she would do the same. But on the stairs she went down she met an old woman so dirty, so ancient, so feeble, that she seemed to correspond with George's account of her.

'You are Mr Gray's laundress?' she asked.

'Yes, Miss; I am.' The woman looked astonished to see such a visitor.

'I want to see him. I want to see him on very important business. Most important to himself. When can I see him?'

'I don't know, Miss. He is uncertain. He was here yesterday evening. He said he should not be here this evening. But I don't know.'

'Look here.' Elsie drew out her purse. 'Tell me when you think he will be here, and if I find him I will give you two pounds—two golden sovereigns. If you tell me right I will give you two sovereigns.'

She showed them. The old woman looked hungrily at the coins. 'Well, Miss, he's been here every Saturday afternoon for the last six months. I know it by the litter of papers that he makes. Every Saturday afternoon.'

'Very good. You shall have your money if I find him.'

In the evening, Elsie said nothing about Mr Dering and her strange discovery. The two young men talked about trying this way and that way, always with the view of implicating Checkley. But she said nothing.

THE DORE AND CHINLEY RAILWAY.

It was the boast of our grandfathers about the end of last century that no considerable town or village in England was at a greater distance from a canal or turnpike road than fifteen miles; and we can easily understand how much better the boast could be sustained at the present time as regards railways. Still there are here and there districts in Great Britain of considerable extent into which the rushing sound of the express train, or the shrill scream of the locomotive whistle, has not yet penetrated. One of the most remarkable of these localities is to be found in the heart of Derbyshire. It lies in the centre of a great industrial district, and is enclosed by three great lines; yet this large, irregularly-shaped triangular space stands out white and clear on the map, perfectly innocent of all modern means of conveyance. Through this space a railway has been in course of construction for the last three years, and is expected to be open for traffic towards the end of the present year.

The Dore and Chinley Railway, as it is called, connects the Manchester and London branch of the Midland Railway at Chapel-en-le-Frith and at Chinley with the same line at Dore, on the Sheffield and Chesterfield section, piercing the mountainous district known as the Peak Forest. The new line is about twenty miles long; and besides opening up an extensive country with great attractions for the tourist, the geologist, and lover of Nature in her sternest and most imposing moods, provides a new and quicker route between

two densely populated towns hitherto but indifferently supplied with means of intercommunication, considering the vast extent of their commercial interests and relations—that is, Manchester and Sheffield; and as competition in railway matters always commands cheaper and speedier means of conveyance and traffic, the opening of the new line is looked forward to with great interest in both localities.

This branch will make what is called 'the Wonderland of Derbyshire' quite accessible and familiar. Like all mountainous districts, it abounds in old-time traditions, and has a history bordering on the marvellous. It would indeed be hard to find another space so limited in extent, at home or abroad, containing so much that is novel and attractive. Lofty mountains, on all sides enclosing romantic valleys, into which the sun cannot penetrate until near his meridian; clear and noisy brooks, of deepest blue in colour, tumbling down the sides of the hills, playing hide-and-seek among the crevices and nooks, and dashing madly over mimic waterfalls, disappearing into subterranean passages, to reappear suddenly in some cave at a much lower level; and then flowing quietly and staidly along the valleys to join together and form a stately river, the Derwent.

Then we have vast and gloomy caves of wonderful formation. The restless and searching streams above, finding their way through the limestone rocks, leave the evidence of their soluble qualities in stalactite formations of such enormous proportions and fantastic shapes and colours as would delight the heart of the mineralogist and fossilist. Caves everywhere with weird and diabolic names and character, many of which have never yet been fully explored by man. There are away on the heights remains and ruins of old castles, built more for the safety and protection than for the comfort of their inmates. Traces of Roman camps are on the hills, and of their workings in the mines. There are the homes of families located here from before the Norman Conquest, such as the Foljambes, the Lyttons—ancestors of the novelist—the Merevils, the Stathams, and many others; and here also is the home of Miss Nightingale, of Crimean fame. The district has been described as resembling more some of the wilder portions of the Highlands of Scotland, than of a county in the heart of England.

Nor is the district wanting in interest in many other ways. Sir Walter Scott has thrown around it the magic of his genius in the charming story, *Peveril of the Peak*. The 'Old Castle of the Peak' is on the heights above the village, which derives its name of Castleton from it. The view from the hills behind is remarkably fine. There are charming contrasts in the landscape around, wild moorland, fertile valleys, and here and there peaceful villages peeping out from luxuriant foliage. There are many other points of interest at the village of Hathersage, five and a half miles distant from Castleton. A needle manufactory is established, and finds employment for numbers of people. Little John, the companion of Robin Hood, was born and buried here, and his grave is regarded with great pride by the inhabitants. Norman William, who sometimes held his court in the Peak Forest, formed the

district into a favourite hunting-ground; and for some generations afterwards his descendants held it as a residence.

But the railway which is to open up this favoured though hitherto little known district is also worthy our attention, and might readily adopt as its motto, 'Hope on, hope ever,' for its central point is the village of Hope, towards which the line is being directed from both ends. It has been aptly described as 'a line of viaducts and tunnels,' is about twenty miles in length, and will cost over a million sterling. In that comparatively short distance it passes through six miles of tunnels, driven through the hard Uredale rock; over three long viaducts and fifty-four bridges, not including a large number over the line; and no doubt in the annals of railway-making it will be characterised as quite as bold and daring in conception as it has been difficult and discouraging in construction. If 'Hope' is to be its motto, the engineers must have realised to the fullest extent the truth that 'hope deferred maketh the heart sick;' for it would appear as if Nature, resenting an invasion of her favoured domain, had arrayed all her forces to prevent it.

Starting from the western end, there are two stations on the main line—Chinley on the north, and Chapel-en-le-Frith on the south. A branch from each meets and forms a junction at Chapel Milton Viaduct. This viaduct has thirteen arches, each forty-five feet span, and one hundred and four feet high. It is built on a curve, which, combined with its great height, makes it quite an imposing and picturesque feature of the landscape. Facing the end of it, Cowburn Hill stands out boldly, and here some of the difficulties encountered in making the line may be seen. During the past three years, fourteen hundred men have been burrowing their way through this hill, a distance of three thousand seven hundred yards, or nearly two and a fifth miles, the whole distance having been excavated by blasting and worked from the ends only, without shafts. It is not what is termed a wet tunnel; but at certain breaks in the continuity of the rocks the water burst through in such quantities and force as to prevent the men working with any degree of efficiency. The extensive character of the work may be estimated from the fact that twenty millions of bricks will be used in lining it. Operations were begun by driving a large bottom heading through the entire length, which allowed locomotives to be used for removing the débris. The rock-drills were worked by compressed air, three large compressors supplying the motive-power. For blasting, ten holes were made in the face of the rock, in each of which three pounds of gelignite—a new and powerful explosive—were placed and fired. Three firings were made each day, giving a progress of from two to four feet. A supply of fresh air is continually flowing into the tunnel from the air-compressors, while a large exhausting fan is drawing off the smoke and foul air. A thirty-foot fan is capable of removing one hundred and eighty thousand cubic feet of air per minute; and the men can work with comfort and safety.

On emerging from Cowburn Tunnel, we reach the first station, Edale, and from there to the great tunnel under Totley Moss there are no

great engineering difficulties in the way. The line keeps in the valley, and follows the course of the noisy little stream, the Noe, except where its windings are so great as to require bridges to be built for crossing it. Between Edale and Hope are some heavy cuttings; but the steam-navvy, which can fill a railway truck with two bites out of an excavation, makes but short work of the heaviest cuttings. It is on this portion of the line the traveller will get a glimpse of the grandeur of the scenery and some of the difficulties overcome in making it. Taking the entire length, there are six stations, or one for every three miles, so that any portion of the railway will be readily accessible without much trouble. Arriving at Edale from the Chinley end, the next station is Hope, which serves for a number of villages, such as Castleton, Bradwell, &c. A few miles farther brings us to Bamford, and then Hathersage; followed by Padley Wood Station for Grindleford, Eyam, &c., and last Dore. Each of these intermediate stations is the outlet to a cave or mine, an old ruin, or a natural curiosity of some kind.

Near Padley Wood Station is the entrance to the Dore and Padley Tunnel, the second longest in England. It runs between Padley Wood and Totley, passing under Totley Moss—famous for the number of its springs—and although not quite finished, is so near completion as to give promise of being so at the end of this year. From the very beginning this tunnel has presented almost insurmountable difficulties to be overcome, particularly in fighting against the entrance of water. In mining or tunnelling, the initial cost of removing any quantity of rock may be estimated with some certainty, but the cost of a perpetual fight with water is always an unknown quantity. In the beginning, at both ends, the water proved a serious hindrance; but as the work advanced, it found its way in, in an ever-increasing quantity and force. Every stroke of the pick seemed endowed with the miraculous power of the wand of Moses, for the water sprang after it. As we get into the tunnel, the atmosphere grows oppressive, notwithstanding the constant flow of fresh air into it. We are beyond the end of the lined portion; and where the men are working, it is narrow, jagged, and low-roofed. Looking at the men in the semi-darkness, working in their shining oilskin suits, sometimes on rafts, oftener stumbling and splashing about in the water, and with the perspiration pouring from their faces, while the water gurgles and splashes noisily around them, and thinking of the three and a half miles which must be won inch by inch under surrounding circumstances, the task does seem a hopeless if not an impossible one. High overhead is Totley Moss, where the brooks and streams are leaping and bounding on their way to join the river below; but through crevices and faults in the rocks, these have found a nearer cut to their destination, and mean to take full advantage of it, as they rush into the tunnel with every noise water is capable of making.

There is water everywhere, dripping and streaming from the roof, pouring down the sides, and springing like mimic Icelandic geysers from the floor. At one place the flood was gauged at thirteen hundred gallons per minute, and the engineer had great difficulty in inducing the men

to persevere. There was in reality no danger; but many of them could not stand it long, and the work was at times seriously delayed or impeded by it. But the engineer, whose motto must ever be, 'A difficulty is merely a thing which must be overcome,' conquered this one by building a wall of bricks and cement at or near the place where the men were working, four feet six inches thick, to keep the water back. Then a drain was made along the bottom of the tunnel, and through this drain and along the culvert by the side of the railway the flow of water was turned into the river Sheaf, one of the tributaries of the Derwent. The other or Padley end of the tunnel was quite as bad, and the flow was gauged at five thousand gallons a minute. For some time the men had to use a raft to float them into the workings; then the water rose so high that they could not force the raft against it, until a dam and shoot were constructed at the dip, to lead the water away faster. At one place the roof and floor are quite dry, and the attention of visitors is directed to the roof, which may be termed a geological curiosity or freak of nature. It is composed of a large flat and smooth slab of shale many yards in length, and completely covers in the tunnel below, forming a natural roof.

With the exception of the tunnel below the Severn, lately completed, the Dore and Padley Tunnel is, as stated, the longest in England. It will require the enormous quantity of thirty millions of bricks to line it throughout. It has been pronounced one of the most perfect tunnels made on any railway, lofty, spacious, substantial, and secure. In a few months, one of the finest holiday districts in England will be opened up; and it is anticipated that there will be a great influx of tourists and pleasure and health seekers to the 'Derbyshire Wonderland.' The principal object the railway company had in view was a shorter and quicker route between two great centres of industry, reducing the time required to something less than an hour. At the same time the Midland Railway Company deserves a meed of gratitude from the public generally for having provided a new playground and health resort in the very heart of England.

JACK MOORE'S TEMPTATION.

BY DENZIL VANE.

IN THREE CHAPTERS.—CHAP. I.

'THAT fellow will be your ruin, Jack. Mark my words. He is idle, dissipated, reckless; no fit companion for any honest and self-respecting young man. I have seen with deep sorrow the marked change in your manner and conduct since you made Harcourt's acquaintance. Believe me, my dear Jack, that in arriving at this decision I am consulting your best interests. Take my advice, or rather, I should say, obey my command, and I promise you that you will live to thank me for what, I daresay, you now think my severity.'

'I think you misjudge Harcourt, uncle,' replied the young man to whom the above exordium was addressed.

'I imagine that my forty years' seniority gives

me clearer perceptions than yours. At anyrate, I have quite made up my mind on this point. You must either give up James Harcourt or—I give you up. No nephew of mine shall consort with a—dissipated young rascal.'

'Come, uncle, aren't you rather too hard on him?' remonstrated Jack Tredinnick Moore.

'Not a bit of it. He deserves every word I have said about him. He is an idle, good-for-nothing scamp, a gambler, a drunkard.'

'He goes into very good society,' murmured the younger man.

'What do you call good society, Master Jack?—And pray, why do you wish to have better society than that you can get in my house? Better society! Why, God bless me! I owe my friends an apology for naming them in the same breath with James Harcourt and his allies,' cried old Tredinnick.

For a minute or two uncle and nephew looked each other in the face. Jack was the only son of old Tredinnick's only sister. During fifteen years the prim, formal, but extremely comfortable house in Russell Square had been Jack's home, for he had lost both parents in early childhood, and old Tredinnick had done his level best to supply their place, crusty old bachelor though he was.

'I—I think you are unjust to Harcourt, uncle,' said the young man at last, his handsome but rather weak-looking face wearing an obstinate expression, as weak-looking faces not infrequently do; 'and I don't see why I should be unjust to him too.'

'Does that mean that you refuse to obey me?' said old Tredinnick, ruffling up his stiff gray hair irritably, 'that you intend to—to defy me?'

'It means that I decline to accept your estimate of my friend Harcourt,' replied Jack sullenly.

'Then you must take the consequences your determination carries with it. The stool you have occupied in my office will be vacant after to-day; and the room that has been yours since—since your poor mother's death,' added old Tredinnick with a tremor in his gruff voice, 'will be empty—after to-day.'

'Very well, uncle.'

Old Tredinnick looked across at his nephew's downcast face. The lad's eyebrows were drawn together in a frown; his rather full under lip was thrust forward in a sullen pout; his cheeks were paler than usual; and there were dark circles under his eyes, a result due to late hours rather than to the agitation of the moment.

Old Tredinnick sighed as he watched him. Then some memory of the past seemed to possess him, for his gray eyes softened, and he was compelled to bring out a red-and-yellow silk handkerchief, with which he blew his nose rather ostentatiously.

'I am sorry,' he began gruffly—'very sorry that you have allowed a mere casual acquaintance to—to come between us, Jack.—But,' he went on, resuming his former positive manner, 'I mean to be as obstinate as you. You elect to stick to your—friend, Harcourt; and I am resolved to stick to my word. You leave my office—'

nobody in my employment shall consort with fellows like Harcourt—and you leave my house.'

'Very well, uncle,' muttered Jack, turning away, as though he intended to take his departure there and then.

'Stop! What—what money have you got?'

'I—I don't know—four or five sovereigns, I believe,' said Jack carelessly.

'And how long do you suppose four or five sovereigns will keep you in bread-and-cheese?'

'Until I get some employment,' was the dogged answer.

'Nonsense! Employment isn't to be had for the asking in this overcrowded city. When I advertised for a copying clerk some months ago, how many applications do you think I had?'

'I am sure I don't remember.'

'Three hundred and fifty; and the salary offered was only a pound a week. How long do you suppose it would be before the three hundred and forty-nine unsuccessful applicants got employment?'

'Can't say; I'm not clever at making calculations,' muttered Jack with surly irony.

'No. Or I should ask you to calculate how long it will take Mr James Harcourt to make the descent of Avernus, and get himself in the clutches of the law,' retorted Mr Tredinnick dryly.

Young Moore raised his head with an aggressive air, and was about to make an indignant remonstrance. But his uncle lifted his hand authoritatively and went on: 'In spite of the—ingratitude with which you have thought proper to repay me for—for the affection I have always shown you, I do not think it right to send you out penniless into the world. Your allowance of fifty pounds a year will be paid to you as usual, quarterly.'

Here Mr Tredinnick went to his writing-table with an expression of stern justice on his rugged but kindly face, took out his cheque-book and filled in a cheque, slowly and methodically, as was his wont. Then he rose and handed the slip of paper to his nephew. 'There's the first quarter of your allowance,' he said quietly. 'So that you may start comfortably, I have made it for twenty pounds, instead of for twelve pounds ten.'

Jack took the cheque with outward reluctance but with inward relief, stuffed it into his breast-pocket, and then held out his hand.

'Good-bye, uncle,' he said with a rather unsuccessful assumption of nonchalance; 'we'll part friends, eh?'

'Certainly, my boy,' cried the old man heartily; 'and if—if you will think better of this affair, I promise to let bygones be bygones. Send Harcourt to the right about, and'—

'I think I am old enough to be allowed to choose my own friends,' interrupted the lad coldly.—'Good-bye, uncle.'

'Good-bye, my boy. I hope you won't have bitter cause to repent of your pig-headedness.—God bless you!' he added hastily. Then the red-and-yellow handkerchief was again put in requisition.

Jack shrugged his shoulders, sauntered out of the room with his hands in his pockets, and within half an hour his portmanteau was packed and hoisted on to the roof of a hansom, inside

which sat Mr John Tredinnick Moore, with his hat tilted over his forehead, his handsome boyish face wearing a decidedly sulky expression. As the hansom turned out of Russell Square, he just glanced up for a moment at the house that had sheltered him for so long, and for that moment's space he wished he had acted otherwise than he had done. But by the time the hansom had rattled along New Oxford Street and reached the corner of Tottenham Court Road, he was in high spirits. He had twenty pounds in his pocket. Harcourt and he were to dine at the Criterion, and later 'take a look in,' as Harcourt phrased it, at one or two of the haunts frequented by men of fashion like themselves, then wind up the evening with a hand at whist or écarté at Harcourt's club. It was this programme as set forth in a note Jack had received from Harcourt that morning which had brought matters to a crisis in Russell Square. Old Tredinnick had then delivered himself of an ultimatum which, as we have seen, resulted in a rupture of their friendly relations.

'I've got twenty pounds in my pocket—there's a lot of amusement to be got out of twenty pounds,' soliloquised Jack, leaning back in his cab and lighting a cigar. 'When it's gone, I'll look out for something to do. But I'll have a jolly week or two, first. After grinding away at that confounded office, I want a holiday; and I mean to have it.'

Jack's twenty pounds lasted just one week. One fine morning he discovered, to his dismay, that when he had paid the bill his landlady had presented to him the night before, he would have exactly half-a-crown in his pocket. It was clearly impossible to make half-a-crown provide for the wants of even a single day; so he sauntered down to Harcourt's sprucely furnished chambers in Suffolk Street to take counsel with his chosen Mentor.

He found Harcourt at breakfast.

'Well, old fellow, what's up? You look rather down in the mouth.—Have a brandy-and-soda?' was that gentleman's greeting.

Jack shook his head.

'You had deuced bad luck last night at écarté. Cleaned out, eh?'

Jack felt in his pocket, then showed on his extended palm the single half-crown that remained from his quarter's allowance.

'I hope you admire it,' he remarked bitterly. 'It is the only portrait of Her Majesty I possess.'

'Hum! That's serious. You'd better apply to the amiable Tredinnick, hadn't you?'

'Not I. I wouldn't face my uncle and tell him that I've spent all the money he gave me in one week for a hundred pounds,' declared Jack, getting very red in the face.

Mr James Harcourt surveyed his pupil critically through his eyeglass, pulled his long sandy moustaches thoughtfully, and then remarked coolly: 'If you won't play the part of returned Prodigal, I suppose there's nothing for it but an application to your other uncle. You wear a watch and chain, I observe; also sleeve-links, a gold pin, and a signet ring. One's jewellery usually goes first.'

'Do you mean that I am to go to a pawnbroker's and pawn the things?' cried the lad.

'I do; since you refuse to betake yourself to Russell Square. I am extremely sorry that circumstances over which I have no control compel me to repress the strong impulse which rises in my breast to—ah—come to your relief. At the present moment, my own funds are low—very low. As for—ah—the little transaction I spoke of—why, it's nothing—nothing, I assure you. Have done the thing myself scores of times, and shall again.'

Jack's face brightened. The idea of a pawnbroker's shop was associated in his unsophisticated mind with extreme poverty and general disreputableness. But, he argued, if such a superfine and fastidious man as Harcourt condescended to raise money on his personal effects, why should not he?

'What do you suppose I should get for—my watch, say? It cost with the chain five-and-twenty pounds. It was a birthday present from my uncle,' he said hesitatingly.

'Five pounds, I should say.'

'That won't last long,' grumbled Jack.

'You may have better luck to-night. I'll take you to a place where you can have a turn at baccarat. Baccarat doesn't want the skill whist and écarté demand.'

Jack's eyes brightened as he listened to his friend's minute directions as to how the necessary sinews of war were to be provided. After all, as Harcourt said, his luck might change; the five pounds he would get on his watch might be decupled that night.

An hour later, Jack returned to his lodgings the richer by five pounds, and the poorer by his watch and several shreds of his self-respect. But to all appearance he was in the highest spirits, for he walked along the pavement with a jaunty air, and laughed immoderately at dinner when Harcourt told some of his amusing stories about the astonishing ups and downs he had known during the ten years of his life in London. Harcourt 'did business' on the Stock Exchange, and, according to his own account, he was one of the acutest and most astute of the many clever fellows who there forgather.

As Harcourt had anticipated, Jack's luck at baccarat that night was extraordinary. But then the best part of his winnings disappeared the very next night with the same facility with which they had been acquired. For a month or two Jack Moore experienced the numerous vicissitudes of a gambler's life. Then he began to weary of the alternate excitement and depression inseparable from such a life. One day, when his exchequer was reduced to the lowest ebb, he announced his intention of seeking for employment; and, wonderful to relate, he was speedily successful in his search. Thanks to his honest-looking face, gentlemanlike manner, his familiarity with the French and German languages, and last, but not least, to his relationship to old Tredinnick, of the well-known firm of colonial merchants Tredinnick & Morgan, he obtained the post of corresponding clerk in the office of the Three Kingdoms Life Assurance. Harcourt seemed greatly amused by Jack's sudden return to the paths of virtue; and when he found that his pupil was no longer willing to be at his beck and call, he delivered himself of the scathing remark, that 'what was

bred in the bone must come out in the flesh; that Moore's commercial upbringing precluded his ever being a man of fashion.' And so a coolness arose between Mentor and his follower.

CURIOUS AMERICAN OLD-TIME GLEANINGS.

'THE only true history of a country,' said Lord Macaulay, 'is to be found in its newspapers.' Sir George Cornewall Lewis expressed his conviction that the historian of the future will find all his materials in the *Times*. The American historian Mr Bancroft seldom saw a newspaper without drawing from it materials for his works. The story-teller often obtains from the daily and weekly press suggestive notes. Charles Reade made excellent use of the romantic episodes recorded in the newspapers. His scrap-books containing clippings from the papers were numerous and valuable, and amongst his most cherished treasures. Many modern men of letters might be mentioned who are alive to the importance of preserving facts drawn from the journals of the day.

Professor James Davie Butler, LL.D., a few years ago wrote an amusing and at the same time a valuable paper on Scrap-books. He related how he had corrected, through seeing in an old Connecticut newspaper an advertisement, statements made by the leading historians of America. It was respecting the horse of General Stark, the hero in the American War who broke Burgoyne's left wing. Headley says, 'Stark's horse sunk under him.' Everett states, 'The General's horse was killed in the action.' Irving writes, 'The veteran had his horse shot under him.' They were led to make the statement from a postscript of a letter the General wrote saying, 'I lost my horse in the action.' Here is the advertisement referred to:

TWENTY DOLLARS REWARD.—Stolen from me, the subscriber, in the time of action, the 16th of August last, a Brown Mare, five years old; had a star in her forehead. Also a doeskin seated saddle, blue housing trimmed with white, and a curbed bridle.—It is earnestly requested of all Committees of Safety, and others in authority, to exert themselves to recover the said Mare, so that the thief may be brought to justice and the Mare brought to me; and the person, whoever he be, shall receive the above reward for both; and for the Mare alone, one-half that sum. How scandalous, how disgraceful and ignominious, must it appear to all friendly and generous souls to have such sly, artful, designing villains enter into the field of action in order to pillage, pilfer, and plunder from their brethren when engaged in battle!

JOHN STARK, B.D.G.

Bennington, 11th Sept. 1777.

The foregoing may be regarded as a good proof of the value of historical facts gleaned from newspapers.

In recent years several interesting works have been compiled from old newspapers. Perhaps the most important is a set of volumes entitled 'The Olden Time Series,' prepared by Mr Henry M. Brooks, a painstaking antiquary, and published

in Boston, Massachusetts. Not the least interesting of volumes is one devoted to the *New England Sunday*. The opening page proves that neither the rich nor the poor were permitted to break the strict Sabbath regulations. In Connecticut, in 1789, General Washington was stopped by the officer representing the State authorities for riding on the Sunday. The circumstances were reported in the columns of the *Columbian Centinel* for December of that year. 'The President,' it is stated, 'on his return to New York from his late tour through Connecticut, having missed his way on Saturday, was obliged to ride a few miles on Sunday, in order to gain the town, at which he had previously proposed to attend divine service. Before he arrived, however, he was met by a Tythingman, who, commanding him to stop, demanded the occasion of his riding; and it was not until the President had informed him of every circumstance, and promised to go no farther than the town intended, that the Tythingman would permit him to proceed on his journey.'

In the old days, little attempt was made to render the places of worship attractive, or even to warm the rooms in which the preachers delivered their long sermons, although the people were obliged by law to attend the services unless they were sick. It was a serious matter not to be a 'meeting-goer;' it was, as Mr Brooks says, to be ranged with thieves and other outlaws. Mr Felt, the compiler of the *Annals of Salem*, has brought together some items of interest bearing on the introduction of stoves into the churches of the district. 'For a long period,' writes Mr Felt, 'the people of our country did not consider that a comfortable degree of warmth while at public worship contributed much to a profitable hearing of the gospel.' He states that the first stove heard of in Massachusetts for a meeting-house was put up by the first Congregation of Boston in 1773. Two stoves were placed in the Friends' Society meeting-house at Salem in 1793, and one in the North Church, Salem, in 1809. 'Not a few remember,' writes Mr Brooks, 'the general knocking of feet on cold days and near the close of long sermons. On such occasions, the Rev. Dr Hopkins used to say now and then: "My hearers, have a little patience, and I will soon close."'

One of Mr Brooks's volumes deals with *Strange and Curious Punishments*, and it gives particulars of many harsh and cruel laws. It appears, from an address delivered before the Essex Bar Association in 1885, that the old-time punishments in America were much milder than the criminal laws of England at the time, and the number of capital offences was greatly reduced. Persons were frequently whipped. The following is an example drawn from the Essex County Court Records: 'In 1643, Roger Scott, for repeated sleeping in meeting on the Lord's Day, and for striking the person who waked him, was, at Salem, sentenced to be severely whipped.'

Whipping appears to have been a common means of punishing offenders who transgressed the laws. In the month of January 1761 we see it stated that four men for petty larceny were publicly whipped at the cart's tail through the streets of New York. We gather from

another newspaper report that a man named Andrew Cayto received forty-nine stripes at the public whipping-post for house-robbery—namely, for robbing one house, thirty-nine stripes; and for robbing the other, ten stripes. It appears in some instances prisoners had, as part of their sentence, to sit on the gallows with ropes about their necks. We read: 'At Ipswich, Massachusetts, June 1763, one Francis Brown for stealing a large quantity of goods, was found guilty; and it being the second conviction, he was sentenced by the Court to sit on the gallows an hour with a rope round his neck, to be whipt thirty stripes, and pay treble damages.' The man was a native of Lisbon, and described as a great thief. 'We hear from Worcester,' says the *Boston Chronicle*, November 20, 1769, 'that on the 8th instant one Lindsay stood in the pillory there one hour, after which he received thirty stripes at the public whipping-post, and was then branded on the hand; his crime was forgery.' It appears that it was the custom to brand by means of hot iron the letter F on the palm of the right hand.

We find at this period persons found guilty of passing counterfeit dollars were sentenced to have their ears cropped.

To illustrate his subject Mr Brooks draws from Felt's *Annals of Salem* not a few quaint items. It is stated that 'in 1637, Dorothy Talby, for beating her husband, is ordered to be bound to and chained to a post.' We see it is stated that 'in 1649 women were prosecuted in Salem for scolding,' and probably in many cases whipped or ducked. The ducking-stool appears to have been frequently employed. Under date of May 15, 1672, we find it stated: 'The General Court of Massachusetts orders that scolds and railers shall be gagged or set in a ducking-stool, and dipped over head and ears three times.'

We find particulars of one Philip Ratclif for making 'hard speeches against Salem Church, as well as the Government,' sentenced to pay forty pounds, to be whipped, to have his ears cropped, and to be banished.' The date of this case is 1631. In the *Annals of Salem*, under date for May 3, 1669, it is recorded that 'Thomas Maule is ordered to be whipped for saying that Mr Higgenson preached lies, and that his instruction was "the doctrine of devils."'

The Quakers were very severely dealt with. At Salem, for making disturbances in the meeting-house, &c., Josiah Southwick, Mrs Wilson, Mrs Buffum, and other Quakers, were whipped at the cart's tail through the town. After being banished, Southwick returned to Salem, and for this offence was whipped through the towns of Boxbton, Roxbury, and Dedham.

In bygone times, hanging the remains of persons executed was general in England; but in America it was an uncommon practice. Mr Brooks, however, gives particulars of a few instances. At Newport, Rhode Island, on March 12, 1715, a man named Mecum was executed for murder; and his body hung in chains on Miantonomy Hill, where the bodies of some Indians executed three years previously were then hanging. A negro hanged at Newport in 1769 was gibbeted on the same hill.

A few lighter passages than those we have studied brighten up the records of American punishments, which were very severe, but not

more severe than those of England of the same period. A prisoner in February 1789 escaped through the jail chimney at Portsmouth, New Hampshire, and wrote on the wall as follows: 'The reason of my going is because I have no fire to comfort myself with, and very little provision. So I am sure if I was to stay any longer I should perish to death. Look at that bed there! Do you think it fit for any person to lie on?'

If you are well, I am well;
Mend the chimney, and all's well!

To the gentlemen and officers of Portsmouth, from your humble servant, WILLIAM FALL.

'N.B.—I am very sorry that I did not think of this before, for if I had, your people should not have had the pleasure of seeing me take the lashes.'

Curiosities of the Lottery is the title of another volume of Mr Brooks's 'Olden Time Series.' Selling lottery tickets was regarded as a respectable calling. 'The better the man,' says Mr Brooks, 'the better the agent. Indeed, it was generally thought to be just as respectable to sell lottery tickets as to sell Bibles; and we have them classed together in the same advertisement.' In England, we must not forget the fact that the business was conducted on the same lines in bygone times. The first lottery in this country was drawn day and night at the west door of St Paul's Cathedral, London, from the 11th of January to May 6, 1569. The profit, which was considerable, was devoted to the repair of harbours. The prizes consisted of pieces of plate.

In the United States, lotteries were instituted for a variety of objects, including building bridges, clearing rivers, rebuilding Faneuil Hall, raising money to successfully carry on the work of Dartmouth College, Harvard College, and other seats of learning. The advertisements were extremely quaint, and illustrated with crudely drawn but effective pictures, supplying 'a speedy cure for a broken fortune.' Poetry as well as pictures was largely employed in advertisements for lotteries. Much has been spoken and written against lotteries; but, nevertheless, in some of the States of the Union they are still lawful.

With a dip into a volume called *Days of the Spinning-wheel*, we will bring our old-time gleanings to a close, leaving several of Mr Brooks's books unopened. The items we will cull relate to a trade once very general in the United States, but happily now a thing of the past. Advertisements similar to the following appeared in all the American newspapers, and not a few of the publishers took an active part in the trade of buying and selling human beings. 'To be sold,' said the *Boston Evening Gazette*, 1741, 'by the printer of this paper the very best negro woman in this town, who has had the smallpox and measles; is as hearty as a horse, as brisk as a bird, and will work like a beaver.' The same publisher stated that he also had on sale 'a negro man about thirty years old, who can do both town and country business very well, but will suit the country best, where they have not so many dram-shops as we have in Boston. He has worked at the printing business fifteen or sixteen years; can handle axe, saw, spade, hoe, or other instrument of husbandry as well as most men,

and values himself and is valued by others for his skill in cookery.'

In the *Gazette* of May 12, 1760, is offered for sale 'a negro woman about twenty-eight years of age; she is remarkably healthy and strong, and has several other good qualities; and is offered to sale for no other reason than her being of a furious temper, somewhat lazy. Smart discipline would make her a very good servant. Any person minded to purchase may be further informed by inquiring of the printer.' It will be gathered from the foregoing that the faults of the slaves were clearly stated.

Children were often given away; and many announcements like the following, drawn from the *Postboy*, February 28, 1763, appeared: 'To be given away, a male negro child of good breed, and in good health. Inquire of Green and Russell.'

Runaway slaves gave considerable trouble to their owners, and the papers include numerous advertisements, details respecting appearance, speech, dress, &c., of the missing persons. After describing his runaway slave, the owner concluded his announcement thus: 'All masters of vessels and others are cautioned against harbouring, concealing, or carrying off the said negro, if they would avoid the rigour of the law.'

AH MOON'S GHOST.

I WENT out to Japan in the year 1871, a time when the old order of things in that fascinating and romantic country had by no means altogether given way to the new. Truly, a railway was in process of construction; there was a telegraph system; the army and navy were rigged out in European uniform; and all civil officials were supposed to have one evening dress suit of imaginary European cut. But the mass of the people still clung to their ancient customs and prejudices and notions and superstitions and costume, and, above all, to their jealousy and suspicion of the *tojin baka*, the 'stupid foreigner.'

Europeans and Americans were not the only objects of dislike. The arrogant Chinaman came in for a large share, and a certain community of language enabled the Japanese to revile him more caustically and effectively than he could the usually unlinguistic European. Our Comprador—the Chinese head of the native department of the office—was one Ah Moon. He was about as thoroughly hated a man as could be found, although he was a good and upright servant to us—perhaps too good and upright to suit the gentle native. More than once he had been waylaid, attacked, and beaten by Japanese whom he had offended by a too rigorous execution of his duty; and more than once his life had been threatened. The result was that he became soured and vindictive, and changed from merely a strict performer of his duty into a tyrant and a bully.

One afternoon in November I was engaged in the daily duty of checking the amount of bullion

and coin in the Treasury—the large strong-room attached to every office. Ah Moon was at my side, taking down the contents of dollar bags and 'yen' boxes in a book, when suddenly the book fell from his hands, an expression of insufferable agony came to his face, he pressed his hands to his sides, uttered an awful cry, which I can never forget, and fell to the floor. When we picked him up, he was dead. A post-mortem examination revealed no traces of poison—simply one tiny piece of powdered glass. We therefore knew that he was the victim of one of the most subtle, insinuating, and terrible forms of poisoning known to nations addicted to that science.

Efforts of course were made to trace the perpetrators of the crime, but without success. Arrests were made by the native authorities for the sake of appearance, and a number of poor wretches were put to the torture in Tobé Prison; but the crime, which was undoubtedly the work of many, could be brought home to nobody, and the affair soon ceased to occupy at any rate European minds. But from the evening of Ah Moon's death, the Treasury was regarded as haunted, and from that day, only one Chinaman could be found who would, without the muttering of much jargon, pass through its great barred entrance. This man was Ah Moon's successor in the post of Comprador, the late head 'shroff' or native cashier, a man named Hai Ling, a shrewd clever fellow, who, strange to say, was as popular with the Japanese as his predecessor had been the reverse.

He was a good-looking man of fifty, with one of these calm, unruffled, expressionless faces which generally characterise the statues of Buddha Nirvana. He was very European in his tastes, inasmuch as he took a great interest in pony-training and racing, and, *mirabile dictu*, for a Chinaman, was not at all a bad rider. He spoke English beautifully, without the smallest infusion of that childish jargon known as 'Pidjin' English; and upon one occasion I saw him knock an offending coolie down in a very scientific fashion, and asked him where he had learned to hit, he replied: 'On board an English man-o'-war.'

So Ah Moon was ceremoniously laid to rest in the Chinese Cemetery near the racecourse, and Hai Ling reigned in his stead.

Hitherto it had been our custom to employ Chinamen as night-watchmen, partly because they were more reliable than Japanese, and partly because they kept awake better. But after Ah Moon's tragic death, not a Chinaman would consent to sit up through the long silent watches of the winter's nights in the neighbourhood of the Haunted Treasury. Hai Ling laughed at his countrymen's superstitious fears; but they were not to be moved, and so Japanese were put on.

But gradually the Japanese became infected with dread, and solemnly declared that at the dead of night they could hear the spirit of the murdered Ah Moon striving to burst its grave-bonds, and groaning terribly all the while. I pooh-poohed the notion, and sent the cowards about their business; but the men who replaced them, strangers from Tokio, who knew nothing about the tragedy, heard the same sounds, and

refused to remain. So, although I was utterly devoid of superstition, I determined to watch myself one night. I did so. Not a sound did I hear from eleven at night until four in the morning—the troublous period for Ah Moon's spirit, and I turned into bed railing at the natives for a lot of chicken-hearted idiots.

Still, as the complaints were renewed during the following days, I thought that, in order to guard against the possibility of a trick being played, I would watch one night without having given notice of my intention to do so. So I quietly hid myself in a corner of the outer office just before eleven o'clock, and waited. Shortly after that hour I heard sounds which certainly came from the direction of the Treasury—scraping, grating sounds, intermingled occasionally with a deep groan, which, I must say, sounded inexpressibly weird and solemn in the stillness of the night. They were not regular sounds, but arose by fits and starts; and even I could quite realise how in the native mind they might be associated with the struggles of an uneasy, restless spirit. I crept softly along to the Treasury door and listened. The sounds did not seem to be in the Treasury, but near it, on the road side of the wall. What did it mean? I confess I was mystified.

The next morning I made a thorough search in the Treasury and about it for some clue to the strange noises. That night I watched again, and at as nearly as possible the same hour as on the preceding night the mysterious noises commenced, the moaning and groaning being heart-rending. It was comical to note the effect upon the fellows watching on the veranda outside—for as a concession to their fears we had doubled the watch—they clapped their hands to their ears, muttered prayers to the Fox God and the Mercy Goddess and the Japanese Pantheon generally, and stood huddled together in a corner, of about as much use in a real emergency as a couple of women. Now a curious circumstance happened.

Opposite to our premises was the 'compound' of a large bungalow which had long remained untenanted and was fast falling to ruin. One morning we heard that the bungalow had been taken by some Japanese—probably men of the modern school, who imagined that they could not better stamp their fervour for the new order of things than by taking to themselves a European house. In times gone by there had been a pleasant garden round this bungalow; but long years of neglect had brought it to the condition of a wilderness, and it was now a mere tangled, uncared-for thicket. A prominent feature was a fine shrub which sprang up almost in a perfect cone, close to the wall dividing the property from the main road; and upon this shrub our manager had long cast covetous eyes, with a view to transporting it to his own garden on the Bluff, a hill outside the Settlement, whereon were situated the private residences of our local aristocracy.

Upon the night after my second vigil at the office, I was dining at a house on the Bund. It was a fine starlit night as I walked thither, and I remember remarking how clearly and distinctly the pyramidal shrub stood out against the deep blue sky. But when I returned at

two o'clock the next morning the shrub was not there! To be sure I had dined, and, after dinner, at the card-table, may have had a couple of brandy-and-sodas, but no more; and it was assuredly no habit of mine to get intoxicated, so that I could only imagine that the manager had got the shrub.

But—next morning the shrub was in its place! From which I had to arrive at the humiliating conclusion that my vision had been clouded—well, by circumstances over which I had no control.

I went up-country shooting for three or four days. When I returned, I asked about Ah Moon's ghost. The Comprador replied that the coolies said it was still walking, and would continue to walk until the body was laid in its final resting-place in China; but expressed his own contempt for their fears. As I walked down to the club that evening, I noticed that the shrub was in its usual place. The bungalow was lighted up; and just as I passed the gate, out came Hai Ling, who saluted me and went on. I dined out that night, and came by the bungalow compound wall shortly after midnight. The shrub was still there, so that my suspicions as to my condition upon the night when I had failed to see it were confirmed beyond a doubt.

Still the mystery of Ah Moon's ghost continued. I *knew* that it could be accounted for, and yet I was utterly at a loss to account for it. In reply to my questions, the watchmen said that the groanings were terrible. They were men I could trust, and their fear was too palpably genuine to be a subject of mirth.

Up to now I had confided the affair to no one, but I now told the manager and the accountant. Of course they laughed me to scorn; but agreed to sit up with me and listen. Not a sound broke the stillness of that night; the laugh against me was renewed and redoubled, and I was pointed out at the club next day as the fellow who believed in ghosts.

But I had heard the sounds, and I determined to find out their cause. I arrived at the conclusion that the more quietly I went to work the better; for it was remarkable that upon the one occasion when I had announced my intention of watching, I had heard nothing; and that upon the other, when the manager and accountant had been with me, there was a similar absence of sounds. So one evening I got the duplicate Treasury key from the manager, and at midnight I slipped quietly into the office, which adjoined our dwelling-house. The watchman was promenading the veranda, click-clacking his pieces of wood in the old-fashioned, idiotic Oriental fashion. I passed him without attracting notice, lit a dark-lantern, noiselessly opened the Treasury doors, and slipped in, carefully locking the doors after me. Presently the unearthly noises began. They were closer to me and more distinct than before; and if I had been asked, I should have said that Ah Moon was busily engaged in hewing out his own grave, and that from his groanings and lamentation he was finding the task a hard one. I racked my brain for the cause. I thought of rats, of the wind, of some hidden force of nature; but the more I thought, the more unaccountable seemed the phenomenon. I sat until I was half frozen, for it was mid-winter; there was half a

foot of snow on the ground outside, and the floor, walls, and roof of the Treasury were of iron.

I got out as I came, and as I passed through the office looked out. The shrub was there, but I could have sworn that its position had been shifted, and somehow or other I got to associate the shrub and the sounds in the Treasury together.

Next morning, I walked over and had a good look at the shrub. It was certainly in its place; but I noticed that the snow all about it was much trampled and marked with footprints.

'Comprador,' I said to Hai Ling when the office opened, 'they are friends of yours who have taken the bungalow over there—aren't they?'

'Yes, sir,' he replied, with—perhaps I fancied it—a little hesitation in his tone, and a faintly perceptible rise of colour into his yellow face. 'They are Japanese gentlemen—two-sworded men: they are very busy getting in their furniture. You can see the carts. They are rich, and will be valuable connections.'

Sure enough, there were drawn up in front of the bungalow three or four carts laden with packing-cases.

The English mail came in that morning, and I went to the club to read the newspapers she had brought. Suddenly a paragraph in one of them arrested my attention. I slapped the paper down with an exclamation of joy, and rushed straight away home, for I felt sure I had solved the mystery of Ah Moon's ghost and of its connection with the shrub.

That afternoon, after the office had been closed for the day, I went in to the manager. He must have seen that I was excited with news, for he said, 'Hullo! Any news about Ah Moon's ghost?'

'Yes,' I said gravely; 'and I want you and Lawson to be with me to-night in the Treasury.'

'Nonsense!' he laughed. 'I thought that old game was played out.'

'Well,' I replied, 'I have the best of reasons for asking you, and perhaps some day you will thank me for it.'

'All right,' he said. 'But mind, if nothing comes of it, you stand Lawson and me a dinner at the Grand Hotel.'

'Done!' said L. 'Bring your six-shooter with you.'

I gave the same invitation to Lawson the accountant, and then went down to the Saibansho or Town Hall, and engaged two policemen to be held at my disposal.

There was evidently a big dinner on at the bungalow opposite that evening, for the whole place was brilliantly lighted up, and I met Hai Ling going in dressed in his clothes of state. At midnight, the manager, Lawson, and I crept downstairs, through the office, and into the Treasury. It was a wild night of snow and wind, and the watchmen were curled up in their corners fast asleep. We took up our positions in the Treasury, each one behind a pile of dollar bags or 'yen' boxes, each of us with a dark-lantern, and each armed with a revolver. In a few minutes there was a grating sound just in front of and under the pile of bags behind which I was hidden. It continued for some time, and was intermingled with occasional groans. Then there was a crack, and a thin ray of light was visible in the iron

floor. Scarcely daring to breathe, so great was my interest, I watched. Gradually the line of light grew broader, and presently the whole plate, some two feet broad by four feet long, was raised up, gently and gradually, and laid over. Then a head appeared. The light below shone on the face, and I at once recognised our Comprador, Hai Ling. He emerged from below quietly and quickly, and stood so close to me that I could have touched him. A second head appeared. It was that of a Japanese, and he stood alongside the Comprador. A third came up, also a Japanese. They had walked beautifully into the trap.

They remained for a few moments listening; then swiftly and quietly they commenced to hand the boxes of gold 'yen through the opening in the floor to somebody below. At that moment I gave a low whistle, and all three of us sprang out with cocked revolvers, and each seized his man. Hai Ling and his friends were so completely surprised by the suddenness and swiftness of our action that they neither uttered a sound nor made the least show of resistance. We turned our lanterns full on, and called in the watchmen—whose amazement at the scene presented to them can be better imagined than described—and then, having secured our prisoners, proceeded to explore their mode of access.

We found that a neat little tunnel had actually been cut through the concrete foundation of the Treasury, passing under our front garden and the road, and coming out exactly on the site of the shrub in the garden opposite. Here we found two Japanese gentlemen, who had taken flight along the tunnel when they heard the arrest of their friends, held fast by the policemen I had engaged.

So at one blow I laid Ah Moon's ghost. If I had not happened to read in the London newspaper how at Pompeii there had been discovered a tunnel cut from the surface and leading into one of the buried buildings, by treasure-hunters, the skeleton of one of whom was found, I should have been too late; the robbers would have carried out their design, and the Bank would have been the poorer by many thousands of dollars.

Mr Hai Ling got his deserts. His Japanese accomplices would have been executed on Tobé Hill but for the intervention of the British Consul; and I got promotion for my share in the laying of Ah Moon's Ghost.

GREEN: ITS SYMBOLISM.

THE symbolism of colours is a subject that covers a very wide field. In love and in war, in ecclesiasticism, in folklore, in dress, in art—in almost every department of life and of thought, colour, as a visible type or symbol of the unseen feeling or thought, has always played a very prominent part. The symbolism of Green is varied and curious, and not a little contradictory. Green is emphatically the colour of hope, of freshness, and of youth. The early ecclesiastical painters all associate it with hope. The wings and robes of Dante's angels that visited the souls in purgatory were green. This association may explain why Armado, in *Love's Labour's Lost*, declares that 'green is indeed the colour of lovers,' a sentiment

in which Shakespeare is supported by Browne, the sweet Devonshire singer, who says that

Green well befits a lover's heate,
But blacke bessems a mourner.

This view of the colour's symbolism may also perhaps explain the many and appreciative references to green eyes to be found in the poets. Green eyes would hardly be reckoned as an element in either masculine or feminine beauty by most plain people; but the poets of many different countries have combined to celebrate their charm; and who have greater claims to be considered authorities on beauty than the poets? In *Romeo and Juliet*, the nurse, expatiating on the perfections of Romeo's rival, says:

An eagle, madam,
Hath not so green, so quick, so fair an eye,
As Paris hath.

Dante, describing his meeting with Beatrice on the summit of the Purgatorial Mount, gives her eyes of this colour. Calderon, Cervantes, and other Spanish writers praise the eye of the emerald hue, in which they are imitated by Longfellow, in his *Spanish Student*, where he speaks of the 'young and green-eyed Gaditana.' But perhaps the poets do not intend to be so precise in their definition of colour as their words might imply. Green is of many shades, and poetical praise of emerald eyes may perhaps be best interpreted by Swinburne's beautiful lines in *Félice*:

O lips, that mine have grown into,
Like April's kissing May;
O fervid eyelids, letting through
Those eyes the greenest of things blue,
The bluest of things gray.

So much praise of green eyes is somewhat curious, when one recollects that the colour is so intimately associated with jealousy—the 'green-eyed monster' of Iago. But this is only a part of the contradictoriness of the symbolism of this chameleon-like colour. Green is the colour of lovers, and at the same time the colour of jealousy and of fickleness, and, if we may believe Chaucer, it is also the colour of avarice. In the *Romaunt of the Rose* he thus describes this unlovely personage:

Ful sade and caytif was she eek,
And also grene as ony leek.

But whatever may be the colour of avarice, the belief in green as a symbol of fickleness is very general. Chaucer's ballad *Against Women Unconstant* has for burden the line: 'Instead of blue, thus may ye wear all green;' and 'green, forsaken clean,' is a familiar saying; or, as it is often more elaborately put:

Green's forsaken;
Yellow's forsworn;
Blue's the colour
That must be worn.

In some country parts, when a younger sister

is married first, the elder is said to 'wear the green stockings;' and years ago in Scotland it was actually a common joke, when such an event happened, to send a pair of these undesirable stockings to the elder sister, to be worn at the dance which in the evening brought the wedding festivities to an end. It is perhaps partly owing to this association with inconstancy, and partly to the general ill-luck connected with green, that this colour is so generally tabooed in wedding costumes:

Married in May, and kirked in green,
Baith bride and bridegroom winna lang be seen.

One reason given for the avoidance of green in wedding dresses is that it is the chosen colour of the fairies; and the little people, as every one knows, are very quick to resent anything that may appear to them to be intended as an insult. At Lowland Scotch marriages of past times, even green vegetables were looked at askance, and kale was not allowed to adorn the table with its curly head. The combination of white and green appears to be particularly portentous, according to the old lines:

Those dressed in blue
Have lovers true;
In green and white
Forsaken quite.

It is another example of the curious inconsistency of the symbolism of green that the colour which is pre-eminently that of hope and of youth—with which it seems strange to connect aught but good fortune—should be also so generally regarded as unlucky. In some parts of the south of England rustic folks regard green with such aversion that they will not use it at all, either in dress or in the furnishing or decoration of their homes. A few years ago, a learned German, Dr Cassel of Berlin, published a little book on the emerald colour, in which he lays it down that green is the colour of the devil and of demons generally, and this position he supports by a multitude of instances gathered from various parts of Europe, showing its diabolical associations. The belief in demoniac agency and activity underlies a great part of those curious notions and observances of our forefathers which are now rapidly dying out, and this association of such agency with the colour green is doubtless at the bottom of the very general belief in its unluckiness.

Of course there have always been many people who have disregarded all such beliefs, and green has been worn many a time and oft. Planché tells us that about 1680 it was the favourite colour in clothes; and no idle superstition kept our archers and huntsmen of old from wearing suits of Lincoln green. A conspicuous instance of the love of this colour in costume is found in the person of Manfred, the famous South Italian king. We are particularly told that when, in the summer of 1259, he waited on the quay at Trani, in Apulia, to welcome his bride, the Princess Helen of Epirus, he was dressed in his favourite green, 'the colour of hope and youth.' On the other hand, and apart from the general superstition, there are particular families that regard the colour as of specially ill omen if worn by one of their members. It is held in ill repute by both the Ogilvies and the Grahams; and the

Sinclairs of Caithness look upon it as unlucky, because their forefathers, who fought and fell, almost to a man, at Flodden Field, were dressed in green on that fatal day.

A MOTHER'S GARDEN.

I SEE her in the dear, dead years,
Blest in her apt and tender ways;
I catch some sweet or humorous phrase;
She smiles; and then all disappears
In a quick mist of burning tears.

A minute, and she comes again,
And loiters where she loitered oft
Upon the long lawns, close and soft,
Tending the blossoms that might wane
With thirsting for the summer rain.

Like her own children, well she knew
The children of her garden-reach,
And ministered to all and each,
From woodbine striving for the blue,
To homely lavender and rue.

She loved the phlox on swaying stem,
The yellow lilies' brief, sweet bliss;
The delicate gray clematis,
And rustic Star of Bethlehem;
She watched and tended all of them.

And many a fragrant flower that yet
In fancy I can smell again
At eve, or after summer rain;
The stocks, so sweet when dewy-wet,
With pansies, wall-flow'rs, and mignonette.

And lavish roses; still I see
Her 'mid them; hear the names I know,
'The Moss Rose,' 'General Jacqueminot,'
'Saffroni,' and the dear old tree
'Tea-scented,' sweet as it could be.

But 'mid the many flowers that were
One might not thrive, and still apart
The childish longing takes my heart,
'Would that the Daphne had lived there,
Since this was so desired by her.'

But ah! what matter now; the grace
Is vanished of her gentle touch;
The heart that cared for all so much,
The noble mien, the loving face,
Have passed unto a higher place.

The walks, the lawns, the rustling trees,
The mimic wood for many a fern,
Expect no more her slow return;
New names, new voices catch the breeze,
And all is changed save memories;

But these are ours until life's slope
Dips down into the darkened dale;
And 'tis by these the Dead avail
To help us still, as still we grope
Toward their high, accomplished hope.

GROUSE DISEASE.

MAN is not the only sufferer from epidemics. These dreaded scourges are indeed the heritage of all flesh, and there are good grounds for the statement that no family of living beings can claim a happy exemption. The fact is becoming daily more apparent that man and animals are common subjects for many similar diseases, of which tuberculosis, anthrax, and diphtheria are not the least frequent; and many readers will call to mind how, during the recent epidemics of influenza, a somewhat similar sickness was extensively prevalent among horses. Such considerations should surely quicken our sense of kinship in suffering with the lower animals; and it is satisfactory to reflect that they have participated in no small degree in the beneficent application of hygienic laws.

But the epidemic which this paper will treat of is, like salmon disease, one which, so far as we yet know, does not affect the animals more closely associated with man in the domestic relations of life. It is the mysterious Grouse Disease, an illness of great fatality, and whose origin has given rise to a large amount of controversial literature. Grouse disease is in many respects an exceedingly interesting one, illustrating as it does a law of widespread generality among epidemics, that whenever the population becomes excessive, disease sets in apparently with the purpose of restoring by violence the balance of living creatures.

It was only at the beginning of the present century that a hitherto unrecognised disease, fatally affecting the grouse of our British moors, began to be talked about; and as the century grew older and grouse moors became more and more valuable, the sickness increased in severity, and in the enormous number of birds which fell under its ravages. As the value of moors became more apparent to the proprietors, great efforts were made to increase the head of game; and the natural enemies of the grouse—the native *Carnivora* and *Falconidæ*—were exposed to the

destructive hostility of gamekeepers. The result was overstocking; the diseased and weakly individuals no longer fell a natural prey to the hawks and weasels, and just as in human communities, where a like condition of over-population prevails, epidemic disease arose, sweeping away multitudes of the healthy along with the weakly and unfit.

To the modern mind the term epidemic, as applied to disease, instinctively calls up the idea of fever and germs spread broadcast over the land. But for many years the true nature of grouse disease was ill understood.

We will briefly mention some of the theories once stoutly maintained. Cold and protracted springs, the extension of sheep-farming, improper management of the heather, unsuitable food, the presence of intestinal worms, have severally been held responsible by their various advocates. Be it remarked in passing that most of the above causes are depressing in their nature, and liable to diminish the vitality of the birds. Another very obvious suggestion was that the destruction of animals which preyed upon the grouse allowed a weakly stock to survive, which became the starting-point of disease.

The pillar of the theory that grouse disease is caused by intestinal worms was the late Dr Cobbold, a great authority on the subject of Entozoa. The grouse, like many other animals, is extremely prone to become the host of parasitic worms, and its alimentary tract is often found crowded with those inconvenient guests. The tapeworm is very common in the grouse; but in those birds found dead or dying on the moors, Dr Cobbold often found immense numbers of an extremely minute hematode worm, which, from its fineness, he named *Strongylus gracilis*. Grouse disease he considered was due to this minute annelid.

But there were many things about grouse disease which were inexplicable on this theory alone. The immense and rapid mortality was sufficient to suggest doubts, along with the fact that many of the birds dead of grouse disease were in good condition and of full plumage, a

state inconsistent with the slow wasting which would ensue from such a cause as entozoa. Consequently, speculation took another direction, and the opinion—previously held by some close observers—gained ground that grouse disease was an epidemic of a highly infectious and fatal kind, comparable in its causes and progress to the epidemic scourges of man. This theory was strongly held by Dr Farquharson, now member of Parliament for Aberdeenshire; and by their careful post-mortem examinations, Professor Young of Glasgow University, and Mr Andrew Wilson, found strong confirmatory evidence in the presence of constant anatomical lesions of the lungs, liver, alimentary tract, and lining membranes. Among the most recent workers on the subject has been Dr Klein, the eminent authority on micro-organisms. He has put the matter on the firm basis of experiment by discovering the germ which produces the disease, and by its inoculation into other animals showing its communicability.

The micro-organism of grouse disease is an extremely minute bacillus, whose elongation is so slight that at first sight it is hardly distinguishable from a coccus. It is found in the blood of the affected grouse, in the lungs in great quantity, in the liver, and in the walls of the alimentary tract. The lungs are acutely inflamed, and this is indeed the essential and characteristic feature—the disease is an infectious pneumonia. But besides this, other organs are sometimes inflamed or congested. Birds inoculated with the bacillus soon show symptoms of severe illness. They become listless and heavy, the breathing is rapid and laboured, the appetite disappears, there is thirst, and often diarrhoea; finally, they become comatose, and die or gradually recover. At an early stage the plumage is ruffled, and the eyes are dim. On the moors where the disease is severe the grouse are found dead or dying in great numbers in the vicinity of water, having flocked there in order to quench the severe thirst caused by the fever.

To sum up briefly—grouse disease is an epidemic fever, the chief symptom of which is inflammation of the lungs. It is caused by a bacillus; and the predisposing causes are overpopulation, undoubtedly assisted by any depressing conditions to which the grouse may be exposed, such as protracted cold and wet spring-times, and unsuitable or insufficient food. Of recent years the disease has been less virulent on our moors. This is largely due to systematic reduction of the head of game within reasonable limits. The eagle, the falcon, and their kindred, are again becoming more numerous on our hillsides with beneficial results; and by the proper exercise of these prudent methods, there is every reason to believe that grouse disease will be prevented from again assuming disastrous proportions. At the same time, little hope can be afforded of its extinction. The grouse cannot be readily caught and vaccinated, even if it were likely that a preventive vaccine were ever to be discovered. And there are good grounds for the belief that grouse disease is not confined to one family of birds. It is quite possible that it may be a general avian scourge. Dr Klein's researches on this point are not yet completely worked out. Inoculation of the pigeon produced no result; crows were found to be slightly susceptible, as also were sparrows;

the common yellow bunting took the disease with extreme readiness, not only by inoculation, but by infection. Some inoculated birds were on one occasion, in Dr Klein's laboratory, placed beside a cage of untouched and healthy buntings. In a couple of days most of the latter had succumbed, and the bacillus of grouse disease was on microscopic examination found abundantly in their tissues. A more excellent illustration of the highly infectious nature of the illness could hardly be obtained. Inoculation of the common mouse also proved highly successful, suggesting that this form of infectious pneumonia may not be confined to the Aves alone, but may also affect certain of the lesser mammalia. The fact is that infectious forms of pneumonia belong to a class of diseases widely prevalent among the higher animals. It is fortunate that they seldom assume so excessive a degree of severity as when sweeping the feathered denizens of our Highland hills away by tens of thousands.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXII.—I AM EDMUND GRAY.

ON Saturday afternoon, the policeman on duty at Gray's Inn was standing near the southern portals of that venerable Foundation in conversation with the boy who dispenses the newspapers, from a warehouse constructed in the eastern wall of the archway. It was half-past three by the clock and a fine day, which was remarkable for the season—August—and the year. The sun poured upon the dingy old courts, making them dingier instead of brighter. Where the paint of the windows and door-posts is faded and dirty—where the panes are mostly in want of cleaning—where there are no flowers in the windows—where there are no trees or leaves in the Square—where the bricks want pointing, and where the soot has gathered in every chink and blackens every cranny—then the sunshine of summer only makes a dingy court shabbier. Gray's Inn in July and August, unless these months are as the August of the year of grace 1891, looks old, but not venerable. Age should be clean and nicely dressed: age should wear a front to conceal her baldness: age should assume false teeth to disguise those gums stripped of their ivory. It was felt by the policeman. 'We want a washin' and a brightenin' in this old place,' he remarked to the journalist. 'We want somethin' younger than them old laundresses,' said the newspaper boy. Great is the Goddess Coincidence. Even while he uttered this aspiration, a young lady entered the gate and passed into the Inn.

'Ha!' breathed the policeman, softly.

'Ah!' sighed the journalist.

She was a young lady of adorable face and form, surpassing the wildest dreams either of policeman or of paper-man—both of whom possessed the true poetic temperament. She was clothed in raiment mystic, wonderful, such as seldom indeed gets as far east as Gray's Inn, something in gray or silver gray with an open

* Copyright 1892 in the United States of America by Harper & Brothers.

front and a kind of jacket. She passed them rapidly, and walked through the passage into the Square.

'No. 22,' said the policeman. 'Now, who does she want at No. 22? Who's on the ground-floor of 22?'

'Right hand—Architects and Surveyors. Left hand—Universal Translators.'

'Perhaps she's a Universal Translator. They must be all gone by this time. The first floor is lawyers. They're all gone too. I saw the clerks march out at two o'clock. Second floor—there's Mr Carstone on the left, and Mr Edmund Gray on the right. Perhaps it's Mr Carstone she's after. I hope it isn't him. He's a gentleman with fine manners, and they do say a great scholar, but he's a Lushington, and a sweet young thing like that ought not to marry a man who is brought home every other night too tipsy to stand. Or there's Mr Gray—the old gent—perhaps she's his daughter. What's Mr Edmund Gray by calling, Joe?'

'Nobody knows. He don't often come. An old gentleman—been in the Inn a long time, for years. Lives in the country, I suppose, and does no work. Lives on other people's work—my work—honest working-men's work,' said the boy, who was a Socialist and advanced.

'Ah! There's something up about Mr Gray. People are coming to inquire for him. First, it was a young gentleman: very affable he was—and free with his money—most likely other people's money. He wanted to know a good deal about Mr Gray—more than I could tell him—wanted to know how often he came, and what he was like when he did come—and would I tell him all I knew. He went to the old laundress afterwards.—Then it was a little old man—I know him by sight—uses the *Salutation Parlour* of an evening—he wanted to know all about Mr Gray too. No half-crown in that quarter, though. He's been spying and watching for him—goes and hides up the passage on the other side of the Square. Kind of spider he is. He's watching him for no good, I'll bet. Perhaps the young lady wants to find out about him too.—Joe, there's something up at No. 22. The old gentleman isn't in his chambers, I believe. She'll come out again presently, and it'll be: "Oh, Mr Policeman, could you very kindly tell me how I can find Mr Edmund Gray?" With a shilling perhaps, and perhaps not. I wonder what she wants with Mr Edmund Gray? Sometimes these old chaps break out in the most surprising manner. Joe, if you ever go into the service, you'll find the work hard and the pay small. But there's compensations in learnin' things. If you want to know human nature, go into the Force.'

'There's old Mr Langhorne, up at the top.'

'So there is. But no young lady wants to see that poor old chap. He's got no friends, young nor old—no friends and no money. Just now, he's terrible hard up. Took a shillin' off o' me last Sunday to get a bit of dinner with. Fine thing—isn't it, Joe?—to be a gentleman and a Barrister all your life, isn't it—and to end like that? Starvation in a garret—eh?—Look out. She will be coming down directly.'

But she did not come down. Two hours and more passed, and she did not come down.

The visitor was Elsie Arundel. She walked

up the stairs to the second floor. Here she stopped. There was a black door, closed, on the right of her, and another black door, closed, on the left of her. On the lintel of one was the name of Mr F. W. Carstone. On the lintel of the other was that of Mr Edmund Gray. Elsie knocked with her parasol at the latter door. There was no reply. 'The old laundress,' she murmured, 'told me that Saturday afternoon was my best chance of finding him. I will wait.' She sat down with hesitation on the stairs leading to the third floor—they were not too clean—and waited.

She was going to do a very plucky thing—a dangerous thing. She had made a discovery connecting Mr Dering directly with this Edmund Gray. She had learned that he came to the office in a strange condition, hypnotic, bringing things from Edmund Gray. She now suspected that the only person who carried on the forgeries on Mr Dering was Mr Dering himself, acted on and controlled by Edmund Gray—and she wanted to find out who this Edmund Gray was. She would confront him and tax him with the crime. It was dangerous, but he could not kill her. Besides, he was described as quite an elderly man. He was also described as a benevolent man, a charitable man, a kindly man: and he wrote letters brimful of the most cheerful optimism. Yet he was carrying on a series of complicated forgeries. She resolved to wait for him. She would wait till sundown, if necessary, for him.

The place was very quiet. All the offices were closed and the clerks gone. Most of the men who lived in the Chambers were away, out of town, gone on holiday, gone away from Saturday till Monday. Everything was quite quiet and still: the traffic in Holborn was only heard as a continuous murmur which formed part of the stillness: the policeman, who had now said all he had to say to the newspaper boy, was walking slowly and with heavy tread round the Court. The Inn was quite empty and deserted and still. Only, overhead there was the footfall of a man who walked up and down his room steadily, never stopping or ceasing or changing the time, like the beat of a pendulum. Elsie began to wonder, presently, who this man could be, and if he had nothing better to do than to pace his chamber all day long, when the sun was bright and the leaves on the trees and the flowers in full bloom?

The clock struck four: Elsie had been waiting half an hour: still Mr Edmund Gray did not arrive: still the steady beat of the footstep continued overhead.

The clock struck five. Still that steady footfall. Still Elsie sat upon the stairs waiting in patience.

When the clock struck six, the footsteps stopped—or changed. Then a door overhead opened and shut and the steps came down the stairs. Elsie rose and stood on one side. An old man came down—tall and thin, close-shaven, pale, dressed in a black frock-coat, worn to a shiny polish in all those parts which take a polish—a shabby old man, whose hat seemed hardly able to stand upright: and a gentleman—which was perfectly clear from his bearing—a gentleman in the last stage of poverty and decay.

He started, surprised to see a young lady on the stairs.

'You are waiting for Mr Carstone?' he asked. 'He is out of town. He will not be back till Monday. Nobody ever comes back before Monday. From Saturday to Monday I have the Inn to myself. All that time there are no slammers and no strangers. It is an agreeable retreat, if only'— He shook his head and stopped short.

'I am not waiting for Mr Carstone. I am waiting for Mr Edmund Gray.'

'He is very uncertain. No one knows when he comes or whither he goeth. I would not wait if I were you. He may come to-day, or to-morrow, or at any time. He comes on Sunday morning, often. I hear him coming up-stairs after the chapel bell stops. He is a quiet neighbour—no slammer or tramp. I would not wait, I say, if I were you.'

'I will wait a little longer. I am very anxious to see Mr Gray.'

'He should wait for you,' Mr Langhorne replied, politely. 'The stairs are not a fit resting-place for you. This old Inn is too quiet for such as you. Mirth and joy belong to you—Silence and rest to such as me. Even slamming does not, I daresay, greatly displease youth and beauty. Chambers are not for young ladies. Beauty looks for life and love and admiration. They do not exist here. Run away, young lady—leave the Inn to the poor old men, like me, who cannot get away if they would.'

'Thank you.—I must see Mr Edmund Gray, if I can. It will not hurt me to wait a little longer.'

'You wish to see Edmund Gray. So do I. So do I. You are a friend of his. Perhaps, therefore, you will do as well. Those who are his friends are like unto him for kindness of heart. Those who wish to be his friends must try to be like unto him. Young lady, I will treat you as the friend of that good man. You can act for him.'

'What can I do if I do act for him?' But there was a hungry eagerness in the man's eyes which made her divine what she could do.

'It is Saturday.' He replied without looking at her. He turned away his head. He spoke to the stair-window. 'To-morrow is Sunday. I have before this, on one or two occasions, found myself as I do now—without money. I have borrowed of Mr Carstone and of Mr Edmund Gray. Sometimes, I have paid it back—not always. Lend me—for Mr Edmund Gray—if you are not rich, he will give it back to you—the sum of five shillings—say, five shillings. Otherwise, I shall have nothing to eat until Monday, when Mr Carstone returns.'

'Nothing to eat? Nothing at all to eat?' Beggars in the street often make the same confession, but somehow their words fail to carry conviction. Mr Langhorne, however, did carry conviction.

The old man shook his head. 'I had some food yesterday at this time. Since then I have had nothing. There was neither tea nor bread in my rooms for breakfast. When the clock struck six, my dinner hour, I thought I would walk along the street and look at the things to eat which are placed in the shop windows.

That relieves a little. But to-morrow will be a bad time—a very bad time. I shall lie in bed. Oh! I have gone through it before. Sometimes'—he dropped his voice—'I have been sore tempted to take something—No—no; don't think I have given way. No—no. Why—I should be disbarred. Not yet—not yet.'

Elsie opened her purse. It contained two sovereigns and a shilling or two. 'Take all,' she said eagerly. 'Take all the gold, and leave me the silver. Take it instantly.' She stamped her foot.

He hesitated. 'All?' he asked. 'All? Can you spare it? I can never repay'—

'Take it!' she said again, imperiously.

He obeyed: he took the gold out of the purse with trembling fingers. Then he raised his rickety old hat—was that a tear that stole into his eyes, or the rheum of old age?—and slowly walked down the stairs, holding by the banisters. He was weak, poor wretch! with hunger. But it was his dinner hour, and he was going to have his dinner.

Elsie sat down again.

It was half-past six—she had been waiting for three hours—when other footsteps entered the house. Elsie sprang to her feet: she turned pale: her heart stood still; for now she realised that if this step was truly that of the man she expected, she was about to confront a person certainly of the deepest criminality, and possibly capable of villainy in any other direction. The steps mounted the stairs. I really think that the bravest persons in the world are those who before the event look forward to it with the utmost apprehension. They know, you see, what the dangers are. Elsie was going to face a great danger. She was going to find out, alone and unaided, who this man was, and why and how he worked these deeds of darkness.

The footsteps mounted higher: from the door to the top of the stairs it took but a single minute, yet to Elsie it seemed half an hour, so rapid were her thoughts. Then the man mounted the last flight of steps. Heavens! Elsie was fain to cry out for sheer amazement. She cried out: she caught at the banisters. For, before her, taking the key of Mr Edmund Gray's Chambers from his waistcoat pocket, was none other than Mr Dering himself!

Yes. An elderly man, of truly benevolent aspect, his coat open flying all abroad, his face soft, gracious, smiling, and full of sunshine, his hat just the least bit pushed back, his left hand in his pocket. Elsie thought again of her portrait at home, in which she had transformed her guardian—and here he was in the flesh—transformed according to her portrait!

She stared at him with an amazement that bereft her of speech and of motion. She could only stare. Even if her mother's voice were suddenly to call out to her that it is rude for little girls to stare, she could not choose but stare. For Mr Dering looked at her with that kind of surprise in his eyes which means, 'What have we here to do with beautiful young ladies?' There was not the least sign of any knowledge of her. He looked at her as one suffers the eyes to rest for a moment without interest upon a stranger and a casual passenger in the street.

He opened his outer door, and was about to

walk in, when she recovered some presence of mind—not much. She stepped forward. 'Can you tell me, please, how I could find Mr Edmund Gray?'

'Certainly,' he smiled—'nothing easier. I am Edmund Gray.'

'You!—you—Edmund Gray? Oh! No—no. You cannot be Edmund Gray—you yourself!' All her beautiful theory of hypnotic influence vanished. No mesmerism or magnetic influence at all. 'You yourself?' she repeated, 'you—Edmund Gray?'

'Assuredly. Why not? Why should a man not be himself?'

'Oh! I don't understand. The world is going upside down. I took you—took you for another person.'

He laughed gently. 'Truly, I am none other than Edmund Gray—always Edmund Gray. My first name I can never change if I wished, because it is my baptismal name. The latter I do not wish to change, because it is our name ancestral.'

'I asked because—because—I fancied a resemblance to another person. Were you ever told that you are much like a certain other person?'

'No; I think not. Resemblances, however, are extremely superficial. No two living creatures are alike. We are alone, each living out his life in the great Cosmos, quite alone—unlike any other living creature. However, I am Edmund Gray, young lady. It isn't often that I receive a visit from a young lady in these chambers. If you have no other doubt upon that point, will you let me ask you, once more, how I can help you? And will you come in and sit down?'

'Oh! it is wonderful,' she cried—'wonderful! most wonderful!' Again she controlled herself. 'Are you,' she asked again, 'the same Mr Edmund Gray who wrote the letter to the *Times* the other day?'

'Certainly. There is no other person, I believe, of the name in this Inn. Have you read that letter?'

'Yes—oh, yes.'

'And you have come here to talk to me about that letter?'

'Yes—yes.' She caught at the hint. 'That is why I came—to talk about that letter. I came in the hope of finding the author of that letter at home.'

He threw open the door of his sitting-room.

'Will you step in? We can talk quite quietly here. The Inn at this hour on Saturday is almost deserted.' He closed the outer door and followed his visitor into the sitting-room. 'This,' he went on, 'is the quietest place in the whole of London. We have not, in this Square, the stately elms of the old garden, but still we have our little advantages—spacious rooms—quiet always in the evening and on Sundays. A few rackets young men, perhaps; but for one who reads and meditates, no better place in London.—Now, young lady, take the easy-chair and sit down. We will talk. There are very few people who talk to me about my theories. That is because I am old, so that I have lost my friends, and because my views are in advance of the world. No man is so lonely as the man born before his time. He is the prophet, you know,

who must be stoned because he prophesies things unintelligible and therefore uncomfortable—even terrifying. I shall be very glad to talk a little with you.—Now, allow me first to open these letters.'

Elsie sat down and looked about her. She was in a large low wainscoted room, with two windows looking upon the Square. The room was quite plainly but quite well furnished. There was a good-sized study table with drawers: a small table between the windows: a few chairs, a couch and an easy-chair: and a large bookcase filled with books—books on Socialism, George had told her. A door opened upon a smaller room: there was probably a bedroom at the back. A plain carpet covered the floor. Above the high old-fashioned mantel were two or three portraits of Socialist leaders. The room, if everything had not been covered with dust, would have been coldly neat: the chairs were all in their places: the window-blinds were half-way down, as the laundress thought was proper—millions of Londoners always keep their blinds half-way down—a subject which must some day be investigated by the Folklore Society: the curtains were neatly looped: it wanted only a Bible on a table at a window to make it the Front Parlour of a Dalston Villa. There were no flowers, no ornaments of any kind.

Mr Edmund Gray opened half-a-dozen letters lying on his table and glanced at them. There were a great many more waiting to be opened.

'All are from people who have read my letter,' he said. 'They share with me in the new Faith of a new Humanity. Happy is the man who strikes the note of leading at the right moment. Happy he who lights the lamp just when the darkness is beginning to be felt.—Yes, young lady, you are not the only one who has been drawn towards the doctrines of that letter. But I have no time to write to all of them. A letter makes one convert—a paragraph may make a thousand.'

Elsie rose from her chair. She had decided on her line. You have heard that her voice was curiously soft and winning—a voice that charms—a voice which would soothe a wild creature, and fill a young man's heart with whatever passion she chose to awaken. She had, besides, those soft eyes which make men surrender their secrets, part with their power and their strength. Did she know that she possessed all this power?—the girl who had no experience save of one man's love, and that the most natural, easy, and unromantic love in the world, when two who are brought up side by side and see each other every day, presently catch each other by the hand and walk for the future hand in hand without a word. Yet Delilah herself, the experienced, the crafty, the trained and taught—could not—did not—act more cleverly and craftily than this artless damsel. To be sure, she possessed great advantages over Delilah in the matter of personal charm.

'Oh!' she murmured softly, 'it is a shame that you should be expected to waste your valuable time in writing letters to these people. You must not do it. Your time is wanted for the world, not for individuals.'

'It is,' he replied—'it is. You have said it.'

'You are a Master—a Leader—a Prince in Israel—a Preacher—a Prophet.'

'I am—I am. You have said it. I should not myself have dared to say it. But I am.'

'No one can doubt it who has read that letter. Be my Master—too—as well as the Master of—all these people who write to you.'

'Be your Master?' He blushed like a boy. 'Could I desire anything better?'

'My Father and my Master,' she added with a little change of colour. Girls take fright very easily, and perhaps this old gentleman might interpret the invitation—well—into something other than was meant.

'Yes—yes.' He held out his hand. She took it in her own—both her own soft hands, and bowed her head—her comely head—over it.

'I came to-day thinking only'—Oh Delilah!—'to thank you for your great and generous and noble words, which have put fresh heart into me. And now that I have thanked you, I am emboldened to ask a favour'—

'Anything, anything.'

'You will be my Master—you will teach me. Let me, in return, relieve you of this work.' She laid her hand on the pile of letters. Let me answer them for you. Let me be your Private Secretary. I have nothing to do. Let me work for you.' She looked into his face with the sweetest eyes and the most winning smile, and her voice warmed the old man's ear like soft music. Ah, Circe!—'Now that I have seen you—let me be your disciple, your most humble disciple, and'—Ah, Siren!—'let me be more, Edmund Gray—I cannot say Mr Gray—let me be more, Edmund Gray.' She laid her hand, her soft-gloved, dainty, delicate hand upon his, and it produced the effect of an electric battery gently handled. 'Let me be your Secretary.'

It was ten o'clock before Elsie reached home that evening, and she refused to tell them, even her own brother and her lover, where she had been or how she had spent her evening.

WHAT A TORPEDO BOAT IS LIKE.

ALTHOUGH it may safely be predicted that most of the excitement and romance of the next great naval war will be centred round the deeds of Torpedo Boats, it is curious that amongst most Englishmen the greatest ignorance exists as to the description and peculiarities of these 'wasps of the sea.' The fact of their being of such comparatively recent construction probably accounts for this, as the first torpedo boat ever built in this country was launched only so long ago as 1877. In that year an English mechanic had suddenly brought before the world, after years of anxious work and thought, the most terrible and wonderful weapon of naval warfare that had ever been invented, and in such a state of perfection that it disarmed all criticism. This weapon was the Whitehead torpedo, so named after its inventor. There had been several different kinds of torpedoes invented before this, but they were all of a very crude and unwieldy pattern. The Whitehead torpedo, on the contrary, was a marvel of mechanical construction.

It may be briefly described as being made of steel, about fourteen feet long, with a diameter of fourteen inches, and shaped like a cigar. In its nose, or pointed end, is contained the explosive; abaft this comes the air-chamber, containing the motive-power of the torpedo—namely, air compressed to a pressure of one thousand pounds to the square inch; abaft this, again, come the engines; then the chamber containing the apparatus for regulating the depth of the torpedo in the water; and astern of all, the two propellers for driving the weapon through the water.

The torpedo is fired or thrust out from a tube on the deck of the ship or torpedo boat, and immediately it touches the water, it adjusts itself to a depth of about ten feet, and makes a bee-line for the object aimed at. If it misses the enemy, a valve opens, and it sinks to the bottom beyond recovery, though this expensive contingency is avoided in peace-time. If it strikes a ship, however, the charge is exploded, and tears and rips the vessel's bottom right open; while the shock at the same time throws all her engines out of gear, and in fact cripples her completely, if indeed it does not send her to the bottom in a few minutes, as in the case of the *Blanco Encalada* last year. The latest development of this torpedo is a weapon eighteen inches in diameter, with a speed of thirty knots, and carrying two hundred pounds of gun-cotton!

Although the Whitehead torpedo was soon made part of the armament of every modern man-of-war, its advent also called into existence a class of vessel which was of a type entirely different from anything that had been seen afloat before. It was seen that the best way of using the torpedo effectually was to fire it from a vessel of great speed and small size, so that it might be brought all the more quickly into close range with the enemy; for it must be remembered that the aim of a torpedo becomes most uncertain at a greater distance than eight hundred yards; at the same time it was necessary at such close quarters that the vessel should offer as little target as possible to the enemy. The result of such a demand was the building of the class of vessels known now as torpedo boats.

The first torpedo boat ever launched was named the *Lightning*, built in 1877 by the firm of Messrs Thornycroft at Chiswick. Though only ninety feet long, her speed was nineteen knots, and this result was considered so remarkable that orders were given for several other boats of the same type. Russia and France lost little time in following suit. Since then the demand for greater length and higher speed has gone on increasing, and there seems no sign of the limit being reached as yet. The latest development is a boat built for the French Government with a length of one hundred and forty-seven feet, and a speed of twenty-six knots on the measured mile!

The full speed of the best English boats, however, does not show such a record as this, the highest obtained being only twenty-two and a half knots, a speed which is quite sufficient, however, for all likely purposes. There are two classes of torpedo boats in our navy—namely, first and second class, the latter being of a very small type, and mostly used for coast defence. The first-class boats, however, are meant for work at sea and for harassing an enemy's ports, and it is of a boat of this class, and of the life and surroundings of those on board her, that the following description is given.

'No. —, first-class torpedo boat,' was the name and style of the little craft which the writer commanded during last year's naval manœuvres. She was only a fairly modern type of torpedo boat, being built by the firm of Thornycroft in 1885, and could at a push work up to a speed of about eighteen knots. Although only sixty-five tons in weight, and one hundred and twenty-five feet in length, her engines were seven hundred and fifty horse-power, or nearly twelve horse-power to every ton, an enormous amount of energy to store up in such a small compass. One would imagine that to stand such a strain the boat would have to be built of very strong and rigid materials; yet she was only made of a mere skin of steel, less than a quarter of an inch thick, supported by light beams and frames of the same material. The deck, also of steel, was flush fore and aft, and would have made quite a decent promenade if it had not been so crowded up with gear and fittings. Right astern was perched the 'ship's boat,' a tiny little dingey, just about fit to carry one passenger and a crew of two men. Then came the 'quarter-deck,' the only decently clear space along the whole length of the deck; and before this, the after 'conning tower,' with a torpedo tube on each side of it; farther on, amidships, came the engine-room hatchways and the large raking funnel; and before the funnel, again, a Nordenfelt machine gun, and another conning tower and torpedo tubes. Aft the funnel also stood a large electric search-light projector, the light for which was supplied by a small dynamo, down on the lower deck. The two torpedoes which the boat carried were placed one in the forward pair of tubes, and one aft in one of the after pair. A small impulse charge of about four ounces of powder was all that was necessary to thrust the torpedo out of the tube into the water, the aiming being done by training the tube in the direction required. The fore-castle was comparatively clear; but little advantage could be derived from that fact, as once in a seaway the forepart of the boat was practically under water. It can easily be seen, therefore, that there was little room to stretch one's legs whilst at sea; but as a matter of fact there was quite enough to do in hanging on to the rails round the deck and preventing one's self from being pitched or rolled overboard.

Although the hull of the boat had but three feet of freeboard, there was far more room down below than would be imagined on looking at her from the outside.

The three officers—namely, captain, sub-lieutenant, and gunner—had a very decent little crib, consisting of a pantry and a neatly-fitted

and compact little 'wardroom'; the upholstered locker seats on each side of the table served the purpose of a couch for the night, for of course there was no such luxury as hammocks or beds on board; and the bed-clothes consisted of a thick warm 'duffle suit,' similar to that worn by the figures in the Arctic Show at the Naval Exhibition. The quarters for the crew of thirteen men forward were very roomy, too, considering the size of the boat; and the sleeping accommodation consisted of cork mattresses laid on the deck, with duffle suits also, to sleep in. The seats and mess tables were made to hinge back from the wall, so that they could be placed out of the way when not actually in use. Of course there were storerooms for provisions and other necessities; and taking the boat altogether, one might easily imagine on a fine day, when everything was dry and clean, that torpedo-boat life was not half a bad one.

So long as the sea is quite smooth and the weather warm this inference may be fairly true; but directly the wind gives a sign of freshening, or the sea begins to get the slightest bit rough, then indeed life on board a torpedo boat becomes a trying one with a vengeance. Men who have never known what sea-sickness is during all their life at sea get thoroughly 'turned up' with the awful motion and vibration. As the flying little craft cuts through the waves, a continual deluge of swirl and foam rushes over and along her deck from bow and stern; all the hatches are perforce screwed down, and those below have to exist on what little air gets down through the ventilators. Every few seconds the vessel's bow is caught by a wave, thrown up in the air high enough to take the keel out of water, and comes down with a smacking thud that almost threatens to rip her bottom right open. At times a bigger wave than the others will come toppling over and look as if it were going to overwhelm the little craft completely; but still she manages to come up again all right, only with the disadvantage, perhaps, of having the sea down the funnel and the furnace fires nearly out. Although the fittings of the boat are all fixed and made to stand a lot of knocking about, it is wonderful what a pandemonium the deck below soon becomes in bad weather. The wardroom table, although screwed firmly down to the deck, is shaken and wrenched from its fastenings, and ends by collapsing altogether; the little cooking-range forward suffers a like fate, and the cook has a merry time of it picking up a mixture of red-hot coals, pots and pans, and half-cooked eatables; or perhaps a thumping green sea smashes in the after-skylight, floods the cabin, and makes pea-soup of everything in the place. The men in the engine-room have to be very careful if they do not want to get uncomfortably mixed up with the machinery; but the men in the stoke-hole, curiously enough, are the best off in the boat; being amidships and down below, they experience the least motion, and it is fortunate they do, for stoking the fires of a torpedo boat under forced draught is difficult work, and decidedly trying in rough weather.

The boat during action is steered from inside the conning tower; but on other occasions the deck-wheel is used, as almost any amount of spray and cold weather is preferable to being

half suffocated below. A few days' life in a sea-going torpedo boat is enough to harden any man; and yet, in spite of its many hardships, there is no life more really liked by the officers and men of the navy. Its chief charm no doubt lies in the fact that it is what blue-jackets call a 'piratical life,' with none of the monotony of an ordinary man-of-war, but with every element of excitement and adventure; and whatever the warlike usefulness of torpedo boats may be, there can be no doubt that they are the best training-ships in the world for instilling into our sailors an enormous amount of energy and pluck.

JACK MOORE'S TEMPTATION.

CHAPTER II.

ONE day Jack made up his mind to pay a visit to Russell Square and beg his uncle's forgiveness for his past folly. After office hours he turned his face towards Bloomsbury with a lighter heart than he had known for many a day. But when he reached the familiar house, a board stared him in the face on which was inscribed, 'To Let.'

Jack's heart sank like lead. He was so utterly nonplussed by this unexpected rebuff, that he turned away without the idea occurring to him that it would be quite easy to go down to the office of Tredinnick & Morgan and ascertain his uncle's present address. The sight of the deserted house had bewildered him.

As he walked down Oxford Street, as ill-luck would have it, he met Harcourt, who greeted him with apparent heartiness, and invited him to dine with him at his club. Jack accepted the invitation mechanically; and the two friends jumped into a hansom, and were driven off to the delectable resort known as 'The Revellers.' It is unnecessary to record how the evening was spent. It resulted for Jack next morning in a racking headache, a dull feeling of remorse, and empty pockets. Worse still, he had given Harcourt his note of hand for fifty pounds, in order to pay his losses at cards to sundry 'Revellers' who demanded payment in cash.

Then the old dissipated life began again. Jack had the sense to keep his post at the Three Kingdoms Assurance Office, and to do his work there in a satisfactory manner. But his evenings were spent with Harcourt, who seemed to have regained all his former influence over him. Sometimes Jack thought of seeking out his uncle and confessing everything; but he always put off doing so under one pretext or other. Every quarter he received a cheque for twelve pounds ten, enclosed without a letter, though the envelope was always addressed in his uncle's small precise writing. And that was the only communication he had had from him for nearly two years.

Jack was rapidly growing morose and discontented. Harcourt began to get tired of his frequent fits of temper, and more than once showed him pretty plainly that he no longer cared for his society. Jack Moore, a humble clerk in the Three Kingdoms Assurance Office, was not quite

so desirable an acquaintance as Jack Moore, the reputed heir of old Edward Tredinnick, the wealthy merchant. And so, without any compunctious visitings of conscience as to his own share in Jack's misfortunes, Harcourt gradually dropped his former ally and pupil.

The process of being dropped is never a pleasant one, especially when the person undergoing it is conscious that, by rights, their relative positions should be reversed. Jack soon saw what Harcourt was at; and then he realised what a fool he had been to quarrel with his kind old uncle for the sake of such a broken reed as his quondam Mentor.

By the exercise of a great deal of self-denial, he contrived to pay Harcourt the money he owed him. But he still shrank from making any appeal for pecuniary assistance to his uncle, or from taking any steps to bring about a more satisfactory state of things between them. He bitterly resented the apparent harshness with which he had been treated, and the callous indifference which had condemned him to complete banishment from his old home.

Jack's character was undergoing a hardening process, which might have had most unfortunate results, but for a seemingly trivial incident that brought a new interest into his life. In fine weather he usually walked down to his office; but on wet days he indulged in the luxury of an omnibus. One cold and rainy morning in October, Jack started for the City in a mood as dismal as the weather; the omnibuses were crowded, but after some difficulty he secured a seat. Hurrying into the vehicle, he squeezed himself into one of the farther corners; next to him was a preternaturally stout woman, burdened with a big parcel, a baby, and an umbrella that would not have disgraced Mrs Gamp herself. Facing him was a young girl, with a pale oval face, a great deal of ruddy-brown hair, and a pair of the loveliest gray eyes he had ever seen. She was very neatly and simply dressed; her manner was characterised by a certain quiet self-reliance and self-possession, though she was apparently quite young, certainly not more than twenty. Somehow, the sight of the girl's gentle serene countenance made Jack forget the jolting omnibus, the muddy streets, the soaking rain, and the uncomfortable propinquity of his neighbour's Brobdingnagian umbrella. It was impossible to be ill-tempered and discontented when this delicate girl bore the discomfort of her surroundings with such sweet serenity.

She was probably a governess or a lady-clerk, he decided, forced to brave all weathers. For the first time in his life, Jack thoroughly appreciated the excellence of an omnibus as a place for the study of the human face divine. It is not an easy thing to watch one's *vis-à-vis* without seeming to stare rudely, and perhaps Jack would not have accomplished the feat had not the young lady produced a book from the black bag she carried, and immersed herself in it so deeply that she seemed quite oblivious of his scrutiny.

But by the time the Strand was reached the young lady's self-possession was completely upset. When the conductor called out 'All fares,' she put her hand in her pocket, then searched hurriedly in her bag. The colour flooded her cheeks, and her hands shook nervously as she

again turned over the contents of her bag. Then she looked up and met Jack's eyes.

'You have left your purse at home?' he said with a smile.

'Yes—I am afraid so.'

Instantly the necessary pence were handed by Jack to the conductor. Waterloo Station was the young lady's destination.

'Fortunately, I always carry my season ticket in my bag, or I should be obliged to go back home, and then I should miss my train,' she said naively when she had thanked Jack for his courtesy.

In her hurried search for her purse the book she had been reading had slipped from her lap and fallen face downwards on the floor of the omnibus. Jack stooped to pick it up; there was an inscription on the fly-leaf, at which he could not refrain from glancing quickly: 'Mirah Lester;' then followed a date, which he had not time to read.

Just then the omnibus stopped at the corner of Wellington Street. Jack handed the volume to its owner, who, with a bright smile and a hasty 'Thank you,' got out, and was soon lost in the crowd.

The whole affair had not occupied more than five minutes; but as the omnibus rumbled on down Fleet Street and up Ludgate Hill, Jack's thoughts were turned into a new and delightful channel, and he blessed the happy chance which had caused him to enter that particular vehicle.

'Mirah Lester—what a pretty name! It suits the owner. Wonder who she is and where the season ticket carries her?' he soliloquised mentally. 'I suppose she travels down from Waterloo every day. Wonder if I shall ever meet her again?'

Several weeks passed, but Jack did not see the young lady with the gray eyes, though he never failed to look out for her on his way down to the City. He purposely travelled daily by omnibus, in the hope of having her for a fellow-traveller. On one occasion he fancied he caught a glimpse of her at Oxford Circus; but the slight figure vanished before he could ascertain its identity.

Had he not been obliged to be at his office punctually at ten o'clock, it is possible that he might have hung about the Waterloo terminus, and ascertained for what station on the South-western line Mirah Lester was daily bound. He did so after office hours; but his quest was vain. In all probability she returned to town earlier or much later in the afternoon. The difficulties he experienced only added to the interest he felt in her; and the constant watching for a glimpse of the sweet face that had so deeply impressed him with a certainty of the goodness and innocence of its owner, diverted his thoughts from brooding over his own grievances and wrongs.

There was still, however, a latent smouldering of anger in his breast when he thought of his uncle. He considered that he had been treated badly, and he was as determined as ever not to make any advances towards him.

'He bade me leave his house. If he wishes to see me, he will send for me,' he thought sullenly.

One morning he found a letter on his break-

fast table, at sight of which his smouldering wrath momentarily blazed up. 'The quarterly cheque sent without a word—flung at me, like a bone to a dog!' he said, taking up the letter and scrutinising the superscription.

On looking at it more closely, he fancied the handwriting was less clear and distinct than formerly. Keeping the letter still unopened in his hand, he continued to scan the address with knitted brows. 'The old fellow is as hard as flint,' he muttered. 'In two years he has not made a single attempt to see me or to make any effort to win me back. I wonder how he can reconcile it to his conscience to treat me with such contemptuous indifference.' Then he glanced moodily at the letter in his hand. 'I have half a mind to throw this in the fire,' he said aloud. 'Wonder if he would take any notice if the cheque was never presented for payment? Wonder if he would think me dead? Wonder if he would care?'

He moved a step or two nearer the fire, burning dully in the narrow grate. Just then a German band in the street below struck up a merry *Volkslied*. Jack paused to listen. The gay, lilting air was surely very familiar to him. He began to seek in his memory for the association connected with it. And then there suddenly flashed on his mind a scene of his early childhood: his young mother, with a smile on her pretty, winsome face, bribing him with the promise of a song to be good and not cry when Uncle Tredinnick asked him to kiss him. The song she had sung had been that very *Volkslied* the street band was then playing under his window. The sullen look died out of Jack's eyes.

'Poor old boy!' he muttered, looking at the unopened envelope. 'I won't burn the cheque; perhaps he has written a line or two this time.'

As the music floated up through the murky air, he at last tore open the envelope. It contained a letter, but no cheque. The letter began 'DEAR JACK;' but when he had read it through, a look of perplexity came into his face; then the blood rushed to his cheeks and the hand holding the letter began to shake violently. He read it a second and a third time, and then he thoroughly understood what had happened. The letter ran as follows:

THE BAY TREES, WIMBLEDON, Nov. 17, 188-.

DEAR JACK—The change of residence, necessitated by my weakened health, has not had the beneficial result I anticipated. During the last few days I have had various unfavourable symptoms, which make me fear that my time in this world will be short. I therefore think it is my duty to set my house in order.

Please draw up a Will as follows: £1000 each to the various London Hospitals; an annuity of £50 to my faithful servant Jedidiah Thrupp; £1000 to be invested in Consols in the name of my nephew, John Tredinnick Moore, the interest to be paid to him, by you, quarterly. The residue of my property, real and personal, to be left in trust to my friends, James Heritage, clerk in Holy Orders; and Philip Morgan of Arnitt Hall, Beckenham, Kent. This trust-money I desire them to employ in founding a College for the Higher Education of deserving Young Men of

the Working-classes, who shall be nominated by the various School Boards of the United Kingdom. The candidates will be required to pass a competitive examination, conducted by eight Professors of the London University.

Kindly follow these instructions, and bring the Will to my house to-morrow afternoon. I am anxious to get it signed without delay.—Yours sincerely,
EDWARD TREDINNICK.

JOHN POUNCEMORE, Esq.,
Lincoln's Inn Fields.

For at least five minutes Jack sat motionless, his hands interlaced and resting on the letter, which he had spread out on his knees; his eyes staring at the line of gray sky visible above the tops of the opposite houses. 'So that is what it means,' he said at last under his breath; 'I am to be practically disinherited.' Then he held out the sheet of paper at arm's length and read it slowly through again from beginning to end. 'Higher Education of deserving Young Men of the Working-classes—indeed,' he exclaimed indignantly; 'and I am cut off with a paltry thousand! A nice way to treat your sole surviving relation, Uncle Tredinnick, upon my word! A thousand pounds! The old skinflint! Even Thrupp, the butler, comes off better than I. Too bad! Yes, I'm shot if it isn't too bad!'

He rose from his chair, took two or three turns up and down the room, gazed savagely out at the leaden clouds, through which a pale sun tried to force its way, made an irritable snatch at the blind with a grumbling remark about the 'glare,' and dragged it half-way down the sash. Then he glanced with disgust at the fried bacon, the rolls and coffee, his landlady had set on the table. The perusal of his uncle's letter had effectually destroyed his appetite. He threw himself again into his chair with the open letter in his hand. The envelope had fallen to the ground; he picked it up and read the address. 'Put the letter into the wrong cover—he wouldn't have made such a mistake two years ago,' he meditated. 'Hints in his letter that he is breaking up. Shouldn't wonder if he is—and serve him right for treating me so badly.'

Then Jack's face grew very pale; he clenched his teeth, and a sudden light came into his eyes. An evil thought had that moment darted into his brain. Why should he send on the letter to old Pouncemore? If his uncle misdirected his envelopes, that was no business of his!

Underlying this thought was another, embodying a most subtle temptation. His uncle was ill, so ill, perhaps, that by the time it was discovered that the letter to Pouncemore had miscarried, he might be incapable of giving instructions for drawing up a will. If he died intestate, Jack, as his next of kin, would succeed to the whole of his uncle's fortune. And, argued the tempter, was not he the only son of old Tredinnick's only sister, and had he not therefore a better right to his uncle's wealth than a set of unknown deserving young men of the working-classes?

Two red spots began to burn in Jack's pale cheeks, and his eyes shone feverishly as he thus dallied with the specious temptation. Then he tried to make terms with his better self. If he did evil by suppressing the letter, he would do

good by bestowing certain gifts to the charities enumerated by his uncle. He would use his wealth worthily. He would turn his back for ever on Harcourt and his dissipated friends. He would begin life over again.

Then he pictured what sort of existence would be his if that unjust will were made and signed, and if his uncle died without revoking or destroying it. He would have the interest of one thousand pounds, and the one pound a week he earned at the office of the Three Kingdoms Life Assurance, to live on, with little prospect of bettering his position. What a life of sordid drudgery awaited him! Surely it was not right that his uncle should be so unforgiving as to carry his resentment beyond the grave! And, reasoned the tempter, was it not by a direct interposition of Providence that the letter had come into his hands? Why should he interfere with its decrees? He had only to remain passive, and things would right themselves. But for a sentimental memory invoked by a gay strain of music, he would have thrown the letter unopened into the fire, and there would have been an end of it. He wished he had. His conscience would not then have been troubled by any tiresome doubts. He wished he had destroyed the letter unread.

Then he thought of his mother, of her hatred of untruth, of the prayers she had taught him, of the songs she had sung as lullabies in winter firelights and summer gloamings. What would she have thought of this contemplated baseness of his? And yet—was he not her only son—was he not old Tredinnick's nephew? Who could have a better right to his fortune! He looked at the letter and then at the fire. One movement of his hand, and the letter would be as if it had never been written.

Just then the clock on the mantel-piece struck half-past nine. He would be late at his office; he must take an omnibus though the morning was fine. He smiled bitterly as he thought of the small economies and cheese-parings of his life. His uncle's fortune amounted to fully sixty thousand pounds. All that money might be his if he just omitted to send on a misdirected letter!

ST OLAF'S DAY IN THE FAROES.

ST OLAF'S Day, the 29th of July, is a very great day indeed in Thorshavn, the capital of the Faroes. That very remote little town, of about twelve hundred inhabitants, cannot be said at any time to be remarkable for its liveliness; but such diversion as it can offer to the stranger seems all compressed into the sixteen or eighteen hours of daylight on this most festive of anniversaries.

It is a day of responsibility for the Governor of the islands, who ordinarily has little enough to do, and whose somewhat frigid drawing-room does not receive many visitors of the diplomatic or aught other kind. He has to represent His Majesty King Christian, and, with a certain amount of state, open the Lagthing, or local House of Parliament. He has also, in the evening, to preside at the traditional banquet, over the claret of which the esteemed members of the Lagthing

become almost indecorously noisy as the speeches proceed and the number of empty bottles increases. Nor does this end the day. For after the procession to church, the opening of Parliament, the afternoon receptions, and the evening feast, there is further a famous dance in one of the Thorshavn rooms, and the populace will think it kind of him if he will squeeze into their midst and perspire with them for a few minutes. This last is the worst ordeal of all. But even in humdrum Faroe it is well for the representative of royalty to be as democratic as his temperament will permit. Here are no cables with the mainland to keep the Faroese posted in the movements of the Reds and the Labour struggles. For all that, the islanders are sufficiently intelligent to know that the days of Harold the Fairhaired are long past, and that every man is nearly as good as every other man.

Almost from daybreak the little harbour of Thorshavn (Thor's port) assumes gala dress on this great festival. The gunboat which may chance to have called at the Faroes on its way from Greenland to Copenhagen is gay with bunting, and fires a gun periodically. The two or three Norwegian barques here for codfish, and the green-hulled Spanish ship in the North seas for the same purpose, pay the like tribute of bunting to the saint of the day; and anon send their men ashore to drink cheap wines and smoke cheap cigars with the rest of the world. But these are trivial manifestations compared with the excitement of the arrival of one boatload of people after another from the other islands. It is no joke facing the currents and squalls of the Faroe seas; but the Faroese are not to be deterred from their annual revel by any terrors of this kind. They come in their best clothes, with clean red-and-black mob caps on their heads—blue-and-black if they are in mourning—and attended by a swarm of their blue-eyed, flax-haired female relatives of all ages. And they are greeted in Thorshavn by their kindred with the utmost warmth; and all day long they are free to eat cake, drink wine, and smoke cigars in honour of the saint, King Christian, and the blood-ties that make hospitality a duty as well as a pleasurable privilege.

Every one who can attends church in the morning, and listens with interest to the patriotic oration which it behoves the Dean of the Isles to deliver from the pulpit. His Excellency the Governor, with cocked-hat and gold lace and sword, sits by the altar, and bows a great many times during the service; and afterwards he shakes hands with the Dean, and having—as it seems—whispered word of the evening banquet, at which the ecclesiastic must by no means forget to be present, he marches down the aisle, followed by the Sheriff, the Sysselman, and the other principal members of this island community of about eleven thousand individuals. The organ peals, the little pigtailed damsels from outlying islets stare wonderingly, and the more irreverent of the Thorshavn boys follow the great folks until they have dispersed each one to his own house, to recruit and prepare for the parliamentary ordeal to ensue in an hour or two.

This second stage in the day's proceedings is quite diverting. Among the thirty or forty mem-

bers of Parliament present, some are sure to be new, not only to senatorial work, but perhaps also even to such metropolitan magnificence as little Thorshavn can offer them. They are stiff big-boned fellows, and they have not changed their usual homespun serge for anything like a black coat. They are embarrassed by their hands and feet; and much embarrassed by the gaze of their more veteran comrades, some of whom are not above being cynical in a mild way at their expense. They even seem to envy the usher—in untanned cowskin moccasins—who directs them into their places with so fine an air of easy authority. One knows as well as if their minds were laid bare to the world, that they are longing to be back in their snug little farms, among the hay and the litter of codfish heads which tell so eloquently of the fine catch of yesterday in the fiord hard by.

Parliament House itself is not, however, a building that ought to appal them. They probably have barns at home quite as large, if less lofty, and provided with fewer windows. It is only some fifteen paces in length by about five in width; and for furniture it contains nothing more striking than a tall old clock, a bust of the king, and a horseshoe table neatly set out with inkpots, pens, blotting-paper, and Reports of the work of the previous session. They themselves give animation to the room; and so do the two or three dozen members of the commonalty who take places in the gallery allotted for the public.

On this the opening day no routine work has to be done, unless the methodical handshaking with the Governor and the 'Hip! hip!' of patriotic joy at mention of King Christian's name may be so regarded. Still the session lasts some little time. Papers have to be signed—a lengthy business for some of the members, who are evidently not at home with their pens. Senatorial gossip warms their hearts, and sets the more modest of them somewhat at their ease. One does not doubt their chatter is of no exalted kind. It is talk about oxen and crops and codfish catches. No matter. The bust of the king dignifies it; and so, when the sitting is dissolved, every one moves cheerfully, as if possessed by the pleasing consciousness that he has done his duty, both as a citizen and a member of the Lagthing.

Once again on the edge of the moor—purple with heath—it is well to return to the town and see how the honest Faroese are enjoying themselves. A few of them are perhaps by this time a little tipsy, even thus early in the day. But Thorshavn is a free port; wines and spirits are so cheap, and St Olaf's feast is such an important one, that the islanders cannot altogether restrain themselves. The calls of hospitality, too, are distinctly onerous. The man from Kalsoe—that rugged northern isle—has a score of friends in the capital. He sees them perhaps twice a year, perhaps only on the 29th of July. Shall he chill their affection for him by refusing to drink with them? He cannot be so churlish; and it is these constant 'skalds' that make him a little hilarious ere two o'clock. His wife, good soul, laughs joyously at his predicament. She would think less well of him if he carried a demure,

chilling face with him wherever he made his calls. Such are the simple habits of the Faroese.

For centuries it has been the custom in Faroe thus to make the most of St Olaf's Day. An old island writer reminds us of it: 'When the Thing [or Lagthing] business was over, the evening was given up to recreation or familiar intercourse; the bards stood forth and sang ballads about the chief events of long-distant and recent times. Men who seldom met now disclosed their minds to each other. Buying and selling were stopped, and gave place to other engagements. The young men on this occasion made acquaintance with the maidens who attended their fathers or near relatives, and many a one journeyed to the Thing to get a bride, or returned therefrom as a bridegroom.'

It is interesting in the light of this reading to mark the processions of girls and youths on the rugged little roads which stretch for a mile or so outside the town. They are exceedingly vivacious, and the blue eyes of the chubby damsels sparkle with latent or evident coquettishness. The lads follow with less alacrity. They have not studied courtship as a fine art. They are rather perplexed, indeed, between the sense that as suitors they are not playing the part that best becomes them, and that sweet instinct of yearning which will not allow them to turn their backs upon the girls and betake themselves to some more active and manly form of exercise. Thus they are led up and down among the basalt blocks and heather of the suburbs, and perhaps as far as the great waterfall at the foot of the mountains where they rise towards the ancient ecclesiastical settlement of Kirkebo. They resolve to atone for this futile dalliance later in the evening, when the great ball opens.

Of the parliamentary banquet towards eight o'clock much of a serio-comic kind might be written. It takes place in the room under the Senate Chamber. Great is the concourse of candles and dishes and bottles; and while the members, with the few privileged guests, stand talking together outside in the cool air, they see the pasties and cakes and things carried past them from the town into the banquet-room. It is essentially a speech-dinner. The Governor proposes 'the King' almost as soon as the first pie is passed round; and no time is lost in following up one toast with another. This circulates the claret rapidly. Sandwiches of ham and beef and cheese follow the pie; then buttered biscuits and sweet cakes. These last are a feature of the repast. They stand about the tables tall and ornate with sugary decorative work, like so many bridecakes. Nor can it be denied that they taste very good—although the hypercritical stranger may be oppressed with grim fancies that whale oil is one of their constituent parts instead of butter. Indeed, they prove so attractive to the banqueters that the temptation to pocket sections of them is irresistible to more than one member of Parliament, who doubtless wishes to share his pleasure with those little round-faced effigies of himself which consecrate his farm a score or so of miles away. But the Governor condones this larceny, even as he condones the condition of certain other members long ere the feast is ended. He may not think much of the civilisation of the Faroese. Yet he knows that Den-

mark has relatively few colonies, and that in his application for removal from this little archipelago he may, for aught he can tell, be sentencing himself to Greenland or Iceland, both even more distant from Copenhagen than the bleak stone residence above the Bay of Thorshavn. St Olaf's Day, like Christmas, comes but once a year; some license may therefore be permitted to accompany it.

Throughout the feast there is a constant ripple of speeches. One gentleman after another rises to say something, to flourish his wine-glass, nod enthusiastically to his particular friends, and finally collapse upon his chair, exhausted by the oratorical strain, or pulled thither by his neighbours, who conceive that he has said as much as becomes him. For the Church, of course the Prost or Dean responds. He is one of the handsomest men in Faroe, with a demeanour almost regal; and exceedingly well suited to him is the white neck frill of office, which recalls the Elizabethan ruffs in England. Law and medicine, too, each have to be answered for. The doctor probably makes a jest about 'la grippe,' which in one form or another—notably as the Kruim, or epidemic of colds, which seems a characteristic of spring and the arrival of strangers here, as in St Kilda—often afflicts little Faroe, though it does not seem to be a very fatal scourge. As for the law, it cannot be said to flourish in the archipelago. An island community of this kind, where most people are cousins to each other, and the tenures of property are of a simple nature, is a bad field for litigation. Still, for the sake of effect, there are two or three advocates in the isles, though they no doubt sigh for the animation and clients of Copenhagen with all their heart.

If a stranger be present, his own health will in all probability be drunk, and he may be toasted in French. Of the assembled members of Parliament naturally not one in ten understands anything of the language of Molière. It is an accomplishment that pertains to those only who have lived their student days in the Danish capital. Nor do they claim to be very expert in it. There is not much intercourse with France up here. The claret and cognac in the Thorshavn stores do not necessarily come direct from Bordeaux in French bottoms. Only once in a way a warship flying the tricolour looks in at Thorshavn after a spell off the Iceland fishing-banks, where she has been dallying for a number of weeks to protect the interests of the French fishers for cod.

At length, however, there is a general rise from table; and the Scandinavian tournament of hand-shaking begins. This is a most laborious affair for a man unused to the exercise. It behoves a person to touch palm with every one present, after which only is he free to go his way with a clear conscience. As some of the guests are by this time 'merry,' it is a lengthy business to part from them. Their friends do their best to enable them to make a pretence of dignity during the last few minutes of the official day; but one wonders how they will be got home through the darkness outside and up and down the miry rough alleys which are Thorshavn's apologies for streets.

From the banquet-room to the ballroom is a

very proper transition for the more enterprising of the feasters. The room is hired by subscription. It is not waxed, nor is it decorated with aught except oil lamps. One steers for it by the heavy sound of many feet on the boards. At the entrance the Thorshavn children stand in a crowd, gazing with admiration at the shadowy procession of men and maids at the upper windows. They are not old enough to be admitted. We others, however, are able to please ourselves; and so, with considerable effort, we squeeze into the midst of the mass of hot Faroe folk, whose faces are streaming with perspiration. There is not much to learn in a Faroe national dance. We do no wrong, therefore, to the symmetry of the dance by joining hands in one of the circles which exist as best they can in so close a compass. The fiddle squeaks, and from men and maids goes forth a low song, while their feet begin to move. The circle tries to rotate. It does not succeed very well, but still the song continues. The words of the song are old Faroese—a language that has no grammar, and which rarely gets printed. 'Love-nonsense' of course is the foundation upon which they are built. And in the pressure of hands during this solemn pretence of a dance, and in the tender glances between one red face and another, one discerns more 'love-nonsense.'

Adjacent to this big room, in which the fishermen and girls find their pleasure, is another smaller one, where the daughters of the officials and others dance politer dances with the students of law, medicine, and theology home for the holidays, and with the sons of the more considerable towns-people. The fun here is of a milder kind. But here, as well as in the big room, the sport lasts for hours after the members of Parliament have been led to their beds by their devoted wives. Indeed, St Olaf's Day is past and over ere the dance in honour of it is at an end.

It was in the year 1024 that Olaf the Holy was acknowledged king in Faroe. Every 29th of July ought to recall to Faroese minds this sacrifice of the island independence nearly nine centuries ago. As a matter of fact, the day is one of mere enjoyment, quite unattended with patriotic pangs of any kind.

THE ISLAND OF THE DEAD.

A WEST-AFRICAN ADVENTURE.

BY DAVID KER.

'MISTARE KER, now sall ve give you sometings to write to your papere. This day you come vid me up de rivare, you zee von island vere live all de dead men in dis countree!'

So spoke a hospitable Dutch trader on the 'Ivory Coast,' who had sheltered us ever since a huge wave dashed up on to the beach at his very door, six days earlier, the water-logged boats in which Mrs Ker and I and our fellow-passengers were escaping from our sinking ship. He and his partner—the only white men in the whole district—had treated us with the utmost kindness, at great inconvenience to themselves; and he was now about to make a journey of several miles up the Cestos River—at the mouth of which we had

been cast away—solely to obtain a fresh supply of food for us from Jenor-Flan, one of the half-dozen black 'kings' of the neighbourhood.

Despite the flagrant 'bull' with which good Mynheer Evert's speech ended, it was abundantly impressive; for the chance of seeing a real native burial-place in this wild region—which was what I supposed 'the island where dead men live' to be—was not to be thrown away. I agreed at once, and we set off that very afternoon.

Not the least difficult part of the voyage is the getting into our boat to begin it; for in West Africa, as on the Upper Nile, a 'landing-place' means simply a wide waste of thick brownish-black mud, in all stages of unsoundness, from the unsubstantial beauty of treacle to the sturdy compactness of Welsh-rabbit. Through this delectable stuff you are carried pickaback by a stalwart native; and should your bearer slip or stumble, you are likely to realise in all its terrible fullness the story of the Irishman who came shouting into a village to seek help for his master, who was 'up to the ankles in a bog.' 'If he's no deeper than that,' said a man, 'he can surely get out by himself.' 'Yis,' cried Paddy; 'but he wint in head first!'

In this new character of 'public burdens,' we have a rather awkward embarkation. Our worthy Mynheer's long gaunt limbs, struggling in the clutch of a powerful black, suggest a negro Lao-coön fighting two remarkably active snakes; and our brawny Scotch engineer, borne with difficulty by two men together through the shallow lagoon, looks somewhat wrathful when I hint that he would make an excellent illustration of Tennyson's famous couplet:

Broad-based upon the people's will,
And compassed by th' inviolate sea.

But all is at length ready, and, propelled by six stalwart Kroomen—who are attired in a uniform consisting chiefly of two brass rings and a leopard's tooth—we soon lose sight of the little trading hut, perched on a bush-clad neck of land between the river and the sea.

And now, in one instant, the gloomy horror of the dreariest place on earth—the mouth of an African river—falls around us like a pall. Look which way we will, nothing is to be seen but the black shadowy masses of the leathery mangroves, thrusting themselves out over the thick, foul, slimy water; while through the dark leaves that coil around each other like writhing snakes, the rank white fever-mist creeps sullenly upward, like a breath of pestilence sent forth from the jaws of Death himself. Ever and anon, the swirl of the eddies in the wake of our boat leaves bare a broad flat mudbank, into the black, glistening surface of which the gaunt, white, claw-like mangrove roots dig themselves hungrily, as if sucking their vampire nourishment from the fathomless depth of slimy rottenness below.

But more gloomy by far than all the outward hideousness of this evil place is its sinister, tomb-

like silence. No sight, no sound of life breaks the horrible and unnatural repose of this ghastly maze of distorted vegetation, which realises grimly that awful forest seen by Dante in the regions of the dead, every tree of which was an agonised human form, writhing in torture as the merciless beaks of the harpies tore its living boughs. The desolation of untamed abundance—worse a thousand-fold than that so-called 'desolation' of barrenness which I have seen in the depths of the Sahara and the great Tartar deserts—is around us in all its terrors.

About a mile and a half up the river, we pass a projecting sand-spit on our right, upon which the riven trunk of a huge tree, white and blasted and dead, stands gauntly up against the dark background of thickets.

'This reminds me of "Demon's Point," on the Lower Gambia,' said I, 'where there is a blasted tree standing out into the stream, just like this one; and the negroes, whenever they pass it, throw food and other things into the water as an offering to the evil spirits. This place seems to produce a similar effect upon the nerves of your bold mariners here, Mynheer.'

In fact, our native boatmen—ordinarily as brave fellows as ever faced a lion or a crocodile—were now beginning to show visible signs of terror, which Mynheer Everts explained by telling me in a whisper that we were now nearing the Island of the Dead. Such an announcement, made amid the voiceless gloom of a region that seemed given over to death and decay, could scarcely be heard without some emotion, even by those who were proof against the superstitious terrors of the savages around us. None of us could tell what we might be about to see; and I, remembering the hundred human skulls which I had found piled up in the king of Bonny's 'fetich-house,' felt more excited than I would have cared to own when, a few minutes later, we turned suddenly to the right just at the point where this gloomy stream was widened by the junction of a smaller river, and glided beneath a curtain of overhanging boughs, which, amid the cheerless twilight that filled this world of shadows, looked weirdly like skeleton hands outstretched to seize us.

And now the dreaded spot lay before us at last—a small, irregular mass of bare rock, cut off on every side by the sullen waters from the living world of men. At all points but one it was hopelessly steep and slippery; but close to where we had halted, a low, flat ledge of rock offered a convenient landing-place, and here I swung myself ashore by the overarching branches, Mynheer Everts cautioning me in an undertone, as I did so, not to remain so long as to offend the prejudices of the superstitious savages beside us, who were already beginning to seem rather restive at what must have appeared to them a most daring and wanton impiety.

Scrambling over three or four rugged and slippery boulders, I came suddenly upon a tableau, which, with its strange mingling of grotesqueness and horror, would have made a worthy study for Doré or Vereshtchagin. Before me lay a deep, narrow hollow, not unlike a grave itself, in which, just where the goblin shadows of the distorted trees overhead fell deepest and blackest, stood two rude wooden cases, partly covered with those

coarse striped cloths familiar to all who have been on the 'Kroo Coast.' What the ghastly contents of these strange caskets might be, was not hard to guess; but, as if to place the matter beyond a doubt, there lay strewn around them a number of human skulls and bones, white and sapless—for in this fearful place there was not even earth enough to hide the dead, and their corpses were left uncovered beneath the open sky, to moulder slowly away.

After what I had already seen of African customs, I needed no one to tell me that the scattered bones were those of slaves who had been slaughtered beside the corpses of their chiefs, in accordance with that grim and seemingly world-wide superstition which, in the Far West, once buried the Indian chief's war-horse in his master's grave, and, in the Far East, consumed the Hindu widow on her husband's funeral pile.

But with the black horror of a scene that might have matched the weirdest fancies of Nathaniel Hawthorne or Nikolai Gogol was grotesquely mingled an alloy of coarse and farcical absurdity. All around the fatal spot, the rocks were thickly strewn with potsherds, old hats, broken clay pipes, fragments of bottles and dishes, snapped knife-blades, tin pans, and greasy shreds of clothing, with which the bones of the murdered slaves were hideously intermingled; for, according to the childish superstition of the African savage, the slaying of a chief's retainers on his tomb, and the destroying there of all the articles which he used when in life, will send the ghosts of the slaves to serve their master with pipe and cup in the world of spirits as in that of men.

Even this dismal den, however, is not wholly unredeemed. Over the miserable wrecks of mortality that lie strewn around it, the graceful syringa has twined lovingly its bright and tender blossoms, combating with its rich fragrance the foul reek of corruption—a mute but eloquent parable of how, amid the worst decay and degradation of man, spring up inexhaustibly the love and mercy of God.

And so I have seen all, and may depart. In truth, it is full time; for so overpowering is the hot, stifling air sent forth from this place of death, that even my experience of Eastern plague-hospitals cannot enable me to bear up against it. But, in the hurry to get away from it, I make more haste than good speed; for my foot slips as I leap from one boulder to another, and I narrowly escape following down into the river a huge stone dislodged by my stumble. At the splash, an answering ripple breaks the oily surface, and up through the thick sullen waters starts ghost-like—a fit sentinel indeed for this ghastly spot—the horny snout, flat ugly head, grinning fangs, and broad, scaly, mud-plastered back, of a gigantic crocodile!

At sight of their favourite game, our stalwart Kroomen, shaking off in a moment the nightmare influence of the dreaded island, break the tomb-like silence with a joyful clamour, and make a snatch at their knives and muskets, as if meaning to attack the monster forthwith. But the river-pirate, finding himself balked of his expected prey, gives a vicious snap of his mighty jaws, and, turning himself round with one powerful sweep of his huge notched tail, vanishes spec-

trally into the gloomy depths below, while I scramble back into the boat again, having learned in those few minutes how even death itself can be made at once frightful and ridiculous.

NOT GENERALLY KNOWN.

EACH time we reach the end of December, we should think with satisfaction that we have got over the most dangerous month, since in this country more deaths are said to occur in December than at any other time of the year. A subject for serious reflection is it that thirty-five millions of people die every year—few of these from old age. In a doctor's opinion, nearly as many people shorten their career by over-eating as from excessive drinking; while in England alone three hundred persons are annually cut off through accidental poisoning.

It seems that we have the choice of two hundred and seventy religions in the United Kingdom; and our taste for sensational novels is shown when thirty per cent. of books published belong to that class. Some of the busiest steel pens of the three and a half millions said to be daily used all over the world are wielded by the fictionists.

In this country, it appears, we have one horse for every twelve persons, and only an average of four hours of daily sunshine in which to ride or walk. A celebrated *aéronaut* asserts, after patient investigation, that the ninth day of the moon is the most rainy of the whole twenty-eight, and four o'clock in the afternoon the rainiest hour of the day.

It may not be generally known that four men in every six use tobacco; yet a medical man in Vienna asserts that diphtheria is thrice as prevalent amongst smokers as those who deny themselves the luxury of the weed.

We are told that children's hair grows more quickly than that of adults. Some say that light-haired people are longer lived than their brethren with dark locks, which is not so consoling to the latter, since more than half of the inhabitants of this country have dark-brown hair.

As a rule, women require one hour of sleep more a day than men. Fewer of the latter reach the age of fifty than the former, but afterwards the sterner sex has the best of it. It has also been found that single women live longer than single men, while married women on an average live two years longer than single ones. A woman's chance of getting married is calculated to be only two and a half per cent. when she reaches her fortieth year. As there are still more men than women in the United States, more of the fair sex should emigrate; as it is, four men emigrate to three women. There is said to be only one sudden death amongst women to eight amongst men. A medical man tells us that the habit among women of biting off the thread when sewing is the chief cause of blood-poisoning. It seems that twenty-five per cent. of the women of this country earn their own living; but one would scarcely believe that there are nearly three hundred and fifty female blacksmiths in England, which, however, sounds no

stranger than the statement that women may now be seen driving cabs in New York.

Few blue-eyed people are said to be colour-blind, and we are told that women as a rule have better eyesight than men; but, on the other hand, three women have false teeth to every two men that wear them. This, we take it, is owing to their greater regard for personal appearance, than that the fair sex is more dentally deficient than their admirers. It is not without interest to note that not a few people living have double rows of natural teeth; while we are assured by an artist that only one person in four thousand eight hundred has a perfect nose.

Though we are told that blindness is on the decrease, it is sad to reflect that three hundred thousand people in Europe suffer from this dreadful affliction. Spain appears to be the greatest sufferer in this respect. An oculist tells us that scarcely one in twenty of watchmakers suffer from weak eyes; and we learn from a doctor that stammering is almost unknown amongst savages. Is this infirmity, then, one of the penalties we pay for civilisation? It would seem that nearly a quarter of all cases of insanity are hereditary, and animals are not free from this visitation.

We hear, on the authority of a recruiting sergeant, that few men have legs of equal length, and that in every thousand men in the British army only eighteen are over six feet in height, which our national vanity prompts us to remark seems a small number. The conclusion is arrived at, that a man's full mental power is not reached before the age of twenty-five, and the development of talent is most marked between the ages of thirty and forty-five years.

Those who notice the rapid growth of their finger-nails should be happy, for it is considered to indicate good health. Yorkshire is said to be the most healthy county in England; but it is a reflection when we are reminded that in Great Britain the yearly loss in wages through ill-health is about eleven millions sterling, and it is estimated that forty per cent. of those who start in business fail, March being considered the slackest month for business. Yet, as a set-off to this discomfiting intelligence, it is affirmed that the average duration of life is considerably longer in this country than in France, for example. Is this because nearly three times as much meat is eaten by us as by the French? No wonder the average Britisher is as strong as two Hindus. Quakers are said, we know not with what truth, to be unusually long-lived.

It is also asserted that the proportionate number of births in Russia is nearly double that of France; while the German population increases faster than that of any other country. France has the cheapest rate of postage, but possesses a capital in which it is said more murders take place in six months than occur in London, Berlin, and Vienna together, in twice that length of time; but altogether more murders take place in the United States than in any other country. The Americans must not be very fond of tea, when they drink eight times as much coffee as the beverage that does not inebriate. A yearly outlay of five millions shows their enterprise in advertising.

It may be interesting to note that Belgium is declared to be the most intemperate country in Europe; that Italy sends five million eggs to England every week; that Spain has fewer daily papers than any other European country; and that most German papers are owned and edited by Jews. In Germany, married men wear wedding rings, a custom which many writers have advocated in this country. Only ten per cent. of German school-boys are said to go in for athletics. We are assured by an employer of German clerks that they work twenty per cent. slower than English ones.

Consumption is believed to be more prevalent in Ireland than in either England or Wales. Four times more Irishmen reside in the United States than Englishmen. It is more difficult to believe the statement that sixty thousand people in the Emerald Isle speak Irish only; or another, that there are forty thousand mud cabins in that country consisting of but a single room. Yet this is the country in which we are told suicide is less prevalent than in any other, which speaks volumes for Pat's light-heartedness. It has been noticed how women mostly commit suicide by drowning, and men by shooting. By the way, suicide is less common amongst miners than any other class of people; and self-destruction, strangely enough, is said to be most prevalent amongst soldiers. Speaking of the military, it may be mentioned that there are eight soldiers located in Ireland to one in Scotland, and that over twenty boys under eighteen years of age have won the Victoria Cross.

Sad is the thought that an average of three British seamen lose their lives every day by drowning, and that three hundred British steamers and sailing-vessels are lost at sea yearly. It is a subject for congratulation to think that of the total number of ships which annually pass through the Suez Canal, nearly eighty per cent. fly the British flag. The speed of our fastest ocean steamers is now greater than that of the express trains on Italian railways. Express trains in Russia rarely travel faster than twenty-two miles an hour. These are very slow expresses, indeed, to ours, yet a railway guard assures us that the fastest trains are always the safest. It is satisfactory to learn that during last year only one person in forty-five million passengers was killed by a railway accident.

We are told that the English of our day is considered by a high authority almost perfect, alike for the purpose of the orator, the philosopher, the lecturer, and the poet. The purest English is said to be spoken in Lincolnshire. There are four times as many words in our language as there are in the French, yet a philologist estimates that the coinage of new words in our tongue goes on at the rate of one hundred annually.

Each person in this country sends on an average forty-four letters yearly through the post, which only lets twenty go astray out of every million letters which go through it. It may not be uninteresting to mention that one person in every nine is left-handed, or that clergymen come next in number to mechanics under the head of inventors. Edison states that very few people know the sound of their own voices.

It is not inspiring to hear that only fifty-four per cent. of the poor-rates are spent in relieving the poor, and to reflect that over a quarter of each generation die before attaining the age of seventeen; but a man thirty-two years of age may expect to live for another thirty-two.

If you wish to increase your chances of life, marry, for, as a rule, married men live longer than bachelors; yet we are told that out of every thousand persons in England more than six hundred are unmarried.

THE SWALLOW'S RETURN.

BLACKBIRD.

Ah, you're welcome from your travels, from across
the ocean, Swallow!

Did you long for daisied meadows and the gold of
gorsy fells,
For the violets in the woodland and the hawthorn of
the hollow,
And the mists of bluebells gleaming in the sheltered
hazel dells?

SWALLOW.

Nay; for months I never wearied of the mosques, and
domes, and towers;
Of the saffron eves and morning, and their still,
unbroken calm;
Of the tamarind's scented blossoms; of the champale's
sacred flowers;
Of the red flamingos resting by the stately cocoa-
palm:

Till I saw a soldier dying once as day broke in its
splendour—

I had seen him very often pacing down the garden
here,
While a maiden clasped his arm, she smiling at the
phrases tender
That I heard him from my dwelling whisper in her
willing ear.

And I thought of chestnut blossoms, and of budding
beech boughs swinging,
As I heard him in his anguish name that maiden
o'er and o'er,
And I longed again to listen to you, Blackbird, gaily
singing,
And the brown bees softly humming round the
lichened nest once more.

BLACKBIRD.

So he's dead! Then that's the reason of the maiden's
tears and sighing;
That is why she would not hearken to my gayest,
loudest strain;
That is why I hear them whisper that she's surely,
slowly dying
For her lover!—Well, friend Swallow, you are
welcome back again.

THE MAFIOSI.

THE Italian Mafia of to-day is not a complex organisation with constitution, ordinances, and bylaws, but a community of sentiment striving to preserve the feudal institution of personal vengeance, and warring against State interference with individual license. There are, however, within this great solidarity of malefactors numerous bands of criminals having a formal organisation, and special fields of action as brigands, cattle-thieves, contrabandists, intimidators, and extortioners, in family or personal groups, such as the Posa, FratuZZi, Amoroso, Stoppaglieri, Fratellanza, Cosca, Mala Vita, and Carciolo. All these societies have their officers, rules, oaths, and penalties—or usually one penalty, Death.

A direct outgrowth of feudalism, the Mafia originated in Florence and Genoa at a time when the retainers of the later mediæval nobles lounged about the now deserted palaces, waiting for the bidding of their masters to carry out some new assassination in the constant campaign of private vengeance. Unlike Nihilism, the Mafia is not strictly a secret society; it is non-political, and is the development and perfection of a supreme power directed to every kind of evil; it is the instinctive solidarity, brutal and selfish, that unites—to the injury of the State, of laws, and of organised society—all individuals that desire to obtain their living not by labour, but by violence, trickery, and intimidation.

In every part of Italy it is undoubtedly a power of malignant activity, which in these days of unrest and anarchy is rapidly extending its nefarious influences. The difference between the rich and the poor Mafiosi is merely one of degree. The wealthy proprietor becomes an ally either to carry on an hereditary feud, to make himself a beneficiary of past crimes, or merely to gratify a desire for power. If he is not in voluntary sympathy with the offenders, he is constrained to lend himself directly or indirectly to their schemes. Otherwise, a gun-shot, a general slaughter of his cattle, a fire that con-

sumes his harvest, a threatening letter or sequestration of his person, reminds him that, while the law has many formalities and delays, the action of the Mafia is summary. He rarely hesitates longer as to where he shall attach his interests; if he does, his own life pays for the delay. It happens thus that a family may be obliged to witness the murder of a relative and remain silent, rather than incur the further action of the Mafia, as they would do by having recourse to the criminal courts.

A similar interest impels the peasant to seek the protection of the lawless, no matter what his better inclinations may be. Should he seek a livelihood by honest labour alone, he will find himself despised, oppressed, and almost starved; but if he violates the law, the Mafia protects him, conceals him, provides him with funds, and contrives that he shall escape punishment. Then the obscurity in which he has dwelt hitherto is exchanged for the esteem of all other delinquents, by whom he is acclaimed as a man of honour, and one who has proved himself worthy of a place in the ranks of those who have shielded him. There is a distinction between the Mafiosi of the mountains and those of the sea-shore, especially those of the commercial cities. In the mountains the crimes are of a ruder sort—stealing and slaughtering cattle, incendiarism, and other outrages; along the coast and in the cities, the alliance works with fraud, extortion, and assassination, with a cunning skill that attains to the perfection of a fine art.

The most important and general of the meeting-places of the Mafia are the great cattle fairs, of which a regular series is held from April until October. Here they assemble from Palermo, Girgenti, Caltanissetta, Trapani, and other provinces; and allies of every grade adjust their reciprocal interests, devise their criminal projects, and plan the execution of them. These fairs are the interprovincial congresses of the organisation, and especially of the agricultural members. For the interchange of opinion they use a certain jargon, intonation, and gesticulation

of their own. For instance, the word for prison is 'collegiu' (college); for manacles, 'curuna' (rosary); for sword, 'statia' (steelyard); 'Be'lassalu stari' (Let him alone) is to be translated: 'This man deserves a severe lesson; now is not the time; we'll meet him alone, and take him while he is off his guard.' The true Mafiosi are polished villains. They assume towards their enemy the language and bearing of fraternal good-humour, or ingenuousness, and suffer a blow without remonstrance; but at night assassinate him. The keynote of the whole alliance is 'Omerta,' the exact etymology of which has long been in dispute. The majority of Italian writers believe it to be derived from 'uomo' (man), that is, to be a man; but Alonghi, one of the most authoritative writers on the subject of criminal bands in Italy, thinks that it signifies 'humility'—a definition that finds support in the assumed humility of the real Mafiosi. To a member of the society, 'Omerta' is the one virtue that includes and supersedes all others.

Members of the Mafia have many secret maxims, which are learnt by heart on admittance to the alliance. The following are some of these rules of conduct: The poor resort to force, fools resort to law. Take the life of whoever makes you lose the means of living. Be respectful to officers of the law, but stand afar off. If I die, I will be buried; if I live, you will be. Of what does not concern you say neither good nor evil. Testimony is good unless given against your neighbour. He that dies is buried, he that lives gets married. An influential friend is worth more than a thousand 'lire' in your pockets. Imprisonment, sickness, and misfortune prove the hearts of friends.

The essence of the constitution of the various bands of the alliance, in city and country alike, is as follows: 1st, Ready, passive, and constant obedience to the Head of the band. 2d, Absolute silence as to the composition and enterprises of the band. 3d, Material, moral, and pecuniary aid to all members, and especially when arrested. 4th, Never to have recourse to legal authority, but to refer all disputes to the leader of the band. The penalty for a violation of any of these obligations is invariably death.

In all the societies the character of initiation is the same. The candidate takes his place before a table on which the effigy of a saint is displayed. The neophyte then offers his right hand to the two associates who have presented him for membership, and they cut his thumb until enough blood has flowed to smear the effigy. He then takes the oath and sets fire to the saint. The candidate is afterwards required to shoot at a crucifix as a symbol of his willingness to assassinate any person, however dear to him. Colacino, in his 'Rivista di Discipline Carcerarie,' gives the oath of the Fratellanza as: 'I swear on my honour to be faithful to the Fratellanza as the Fratellanza is faithful to me. As this saint is buried and these drops of my blood, so will I shed all my blood for the Fratellanza; and as these ashes and this blood cannot be restored, so can I never be released from the Fratellanza.'

The formula for the recognition of one member by another is somewhat interesting. The colloquy begins with a familiar question: 'Have you a cigar stump? My tooth aches.' 'Yes.'

'What time is it?' 'My watch is thirty minutes slow.'—'How long since?' 'Since the 25th of March, the day of the Annunciation.'—'Where were you on that day?' 'I was at'—(here he names the place where he was initiated).—'Whom do you adore?' 'The sun and the moon.'—'Who is your god?' 'Aremi' (a playing-card).

The Mala Vita, the organisation of which is very elaborate, is divided into three sections—the Camorristi, Picciotti, and Giovinnotti. The oath of initiation is comprehensive: 'With one foot in the grave and the other in chains, I swear to abandon father, mother, wife, children, and all kindred in order to make war upon the infamous and to protect the humble.' The object of this society is theft, the fundamental principle being that 'those who possess nothing have a right to live at the expense of those who have property.' The license to steal is given to all members; but they are required to divide the spoils with the Camorristi. The other obligations imposed upon members are similar to those already mentioned.

If a member of the Mafia is arrested, the machinery of the fraternity is put into play at once, and much ingenuity is displayed to secure his release. Should it happen that the case is referred to the criminal court, there commences a series of intrigues and intimidations that continue until the jury have given a verdict. The names of the jury are first procured, and attempts are made to influence those who may be engaged. A possible jurymen hears intimations that the prisoner is the victim of the plots of his enemies, but that he also has many powerful friends, who will defend him at any cost, and, if necessary, punish his persecutors. Remarks of this last kind rarely fail of their purpose, for cases are known where jurymen and witnesses have been murdered the day following that on which a prisoner has been found guilty. Money is used with both jurymen and witnesses, if they are susceptible to that argument; and the organisation seldom fails in its efforts to secure an acquittal. In fact, it is impossible for a jury to do its duty with the Damoclean sword of the Mafia hanging over its head.

When the society is short of money, subscriptions are requested with a politeness so formal as to be humorous. The preliminary movement is a threatening letter, full of 'humility,' and couched in artful terms of diplomacy. It begins with a flourish of titles: 'Your Excellency and your illustrious Lady have an abundance, and it is necessary to make an appeal to your generosity, though it is unfortunate that your Excellency should be disturbed. Some poor fathers of family are in great destitution, and ask for' [here the amount is inserted] 'because their dependents are many.' They are sure he will grant their request, and beg to assure him of their eternal gratitude and unconditional devotion, and they also add that he will be left in peace. If, after some days, no response is made, a second letter follows, in which the writer intimates that, because of the delay, he himself is being suspected of treachery to his fellow-sufferers, who are now discussing the use of harsh measures. Then, if the recipient of these communications still remains silent, woe betide him!

The heads of family issue their final warning: 'You are a dead man!' or, 'You will pay dearly for this!' The police are informed, and make a fruitless search for the offender and his accomplices. For a time, when the informer goes out, he takes a protective escort of a few friends or servants; but lulled to a sense of security by two or three months of immunity from attack, he finally ventures out alone, is assassinated, and all the neighbourhood knows whence the blow fell.

That the strength and influence of the Mafia is recognised with apprehension by the Italian Government is undeniable; and facts revealed at the recent trials at Bari and New Orleans tend to confirm the opinion that it is now closely allied with the Anarchist movement. Notwithstanding the efforts of the Italian police, its power is rapidly increasing, and its attitude towards both Government and society is certainly the reverse of reassuring.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXIII.—MASTER AND DISCIPLE.

It was Sunday afternoon in Gray's Inn. The new Disciple sat at the feet of the Master, her Gamaliel: one does not know exactly the attitude adopted by a young Rabbi of old, but in this case the disciple sat in a low chair, her hands folded in her lap, curiously and earnestly watching the Master as he walked up and down the room preaching and teaching.

'Master,' she asked, 'have you always preached and held these doctrines?'

'Not always. There was a time when I dwelt in darkness—like the rest of the world.'

'How did you learn these things? By reading books?'

'No. I discovered them. I worked them out for myself by logic, by reason, and by observation. Everything good and true must be discovered by a man for himself.'

'What did you believe in that old time? Was it, with the rest of the world, the sacredness of Property?'

'Perhaps.' He stood in front of her, laying his right forefinger in his left forefinger and inclining his head. 'My dear young scholar, one who believes as I believe, not with half a heart, but wholly, and without reserve, willingly forgets the time when he was as yet groping blindly in darkness or walking in artificial light. He wishes to forget that time. There is no profit in remembering that time. I have so far drilled and trained myself not to remember that time, that I have in fact clean forgotten it. I do not remember what I thought or what I said, or with whom I associated in that time. It is a most blessed forgetfulness. I daresay I could recover the memory of it if I wished, but the effort would be painful. Spare me. The recovery of that Past would be humiliating. Spare me, scholar. Yet, if you wish—if you command'—

'Oh, no, no! Forgive me.' Elsie touched his hand. He took hers and held it. Was it with

a little joy or a little fear that the girl observed the power she already had over him? 'I would not cause you pain. Besides—what does it matter?'

'You know, my child, when the monk assumes the tonsure and the triple cord, he leaves behind him, outside the cell, all the things of the world—ambition, love, luxury, the pride of the eye—all—all. He forgets everything. He casts away everything. He abandons everything—for meditation and prayer. The monk,' added the Sage, 'is a foolish person, because his meditation advances not the world a whit. I am like the monk, save that I think for the world instead of myself. And so, spending days and nights in meditation, I know not what went before—nor do I care. It is a second birth when the new faith takes you and holds you together, so that you care for nothing else. Oh child!—upon you also this shall come—this obsession—this possession—so that your spirit shall know of no time but that spent in the service of the Cause. Nay, I go so far that I forget from day to day what passed, except when I was actively engaged for the Cause. Yesterday, I was here in the afternoon. You came. We talked. You offered yourself as my disciple. I remember every word you said. Could I ever forget a disciple so trustful and so humble? But—before you came. Where was I? Doubtless here—meditating. But I know not. Then there are things which one must do to live—breakfast, dinner—of these I remember nothing. Why should I? It is a great gift and reward to me that I should not remember unnecessary things—low and common things. Why should I try to do so?'

'No—no,' murmured the catechumen, carried away by his earnestness. 'Best forget them. Best live altogether in and for the Cause.' Yet—she wondered—how was she to bring things home to him unless he could be made to remember? He was mad one hour and sane the next. How should she bridge the gulf, and make the mad man cross over to the other side?

The Master took her hand in his and held it paternally. 'We needed such a disciple as you,' he went on, slightly bending his head over her. 'Among my followers there is earnestness without understanding. They believe in the good time, but they are impatient. They want revolution, which is terrific and destroys. I want conviction. There are times when a great idea flies abroad like the flame through the stubble. But men's minds must first be so prepared that they are ready for it. The world is not yet ready for my idea, and I am old, and may die too soon to see the sudden rise of the mighty flood, when that doctrine shall suddenly cease in all mankind. We need disciples. Above all, we need women. Why do women, I wonder, throw themselves away in imitating man, when there are a thousand things that they can do better than any man? I want women—young, beautiful, faithful. I can find work for hundreds of women. Hypatia would be worth to me—to us—far more than he of the Golden Mouth. Child—your sweet voice, your sweet face, your sweet eyes—I want them. I will take them and use them—expend them—for the great Cause. It may be that you will be called upon to become the first martyr of the Cause. Hypatia was murdered by a raging

* Copyright 1892 in the United States of America by Harper & Brothers.

mob. You will have against you a mob worse than any of Alexandria. You will have a mob composed of all those who are rich, and all who want to be rich, and all the servile crews at their command. Happy girl! You will be torn to pieces for the cause of humanity. Happy girl! I see the roaring, shrieking mob. I see your slender figure on the steps—what steps? Where? I hear your voice, clear and high. You are preaching to them: they close in round you: you disappear—they have dragged you down: they trample the life out of you. You are dead—dead—and a name for ever. And the Cause has had its martyr.'

It was strange. She who had offered herself as a disciple with deception in her heart, thinking only to watch and wait and spy until she could see her way plain before her, who knew that she was listening to the voice and the dreams of a madman. Yet she was carried away: he made her see the mob: she saw herself dragged down and trampled under their heels. She shuddered, yet she was exultant: her eyes glowed with a new light: she murmured: 'Yes—yes. Do with me what you please. I am your disciple, and I will be your martyr, if you please.'

Great and wonderful is the power of Enthusiasm. You see, it matters nothing—nothing in the world—what a man has to preach and teach—whether he advocates Obi or telepathy, or rapping, or spirits who hide teacups in coat-pockets—it matters nothing that there is neither common-sense nor evidence, nor common reason to back him, if he only possess the magnetic power, he will create a following: he will have disciples who will follow him to the death. What is it—this power? It makes the orator, the poet, the painter, the novelist, the dramatist: it makes the leader of men: it made the first King, the first Priest, the first Conqueror.

'Come,' said Mr Edmund Gray; 'the time passes. I must take you to my Place.'

They walked out together, Master and Scholar. The man who was mad walked carelessly and buoyantly, his coat flying open, one hand in his pocket, the other brandishing his walking-stick, his head thrown back, his face full of light, and, though his words were sometimes strong, always full of kindness. Now the sane man, the man of Lincoln's Inn, wore his coat tightly buttoned, walked with a firm precise step, looked straight before him, and showed the face of one wholly occupied with his own thoughts. There was a man who was mad and a man who was sane: and certainly the mad man was the more interesting of the two.

'This place,' said the Master, meaning Gray's Inn, 'is entirely filled with those who live by and for the defence of Property. They absorb and devour a vast portion of it while they defend it. No one, you see, defends it unless he is paid for it. Your country, your family, your honour—you will defend for nothing; but not another man's Property—no. For that you must be paid. Every year it becomes more necessary to defend Property; every year the hordes of mercenaries increase. Here they are lawyers, and lawyers' clerks—a vast multitude. Outside there are agents, brokers, insurers, financiers—I know not what—all defending Property. They produce nothing, these armies: they take their toll: they

devour a part of what other people have produced before they hand on the residue to the man who says it is his Property.'

'Oh!'—but Elsie did not say this aloud—'if these words could only be heard in Lincoln's Inn! If they could be repeated to a certain lawyer! From time to time she looked at him curiously. How if he should suddenly return to his senses? What would he think? How should she explain? 'Mr Dering, you have been off your head. You have been talking the most blasphemous things about Property. You would never believe that even in madness you could say such things.' No; he never would believe it—never. He could not believe it. What if his brother, Sir Samuel, were to hear those words? Meantime, the Apostle walked along unconscious, filled with his great Mission. Oh heavens! that Mr Dering—Mr Dering—should believe he had a Mission!

The Master stopped a passing tramcar. 'Let us climb up to the roof,' he said. 'There we can talk and breathe and look about us, and sometimes we can listen.'

On the seat in front of them sat two young men, almost boys, talking together eagerly. Mr Edmund Gray leaned forward and listened shamelessly. 'They are two young atheists,' he said. 'They are cursing religion. There is to be a discussion this evening at Battle Arches between a Christian and an Atheist, and they are going to assist. They should be occupied with the question of the day: they cannot, because they, too, are paid defenders of Property. They are lawyers' clerks. They are poor and they are slaves: all their lives they will be slaves and they will be poor. Instead of fighting against slavery and poverty, which they know and feel, they fight against the Unknown and the Unintelligible. Pity! Pity!'

They passed two great Railway Termini, covering an immense area with immense buildings.

'Now,' said the Sage, 'there are millions of Property invested in railways. Whenever the railway servants please, they can destroy all that Property at a stroke. Perhaps you will live to see this done.'

'But,' said Elsie timidly, 'we must have things carried up and down the country.'

'Certainly. We shall go carrying things up and down the country, but not in the interests of Property.'

The tram ran past the stations and under broad railway arches, called Battle Arches—where the two young atheists got down, eager for the fray, always renewed every Sunday afternoon, with the display of much intellectual skill and much ignorance. It is a duel from which both combatants retire, breathed and flushed, proud of having displayed so much smartness, both claiming the victory, surrounded by admiring followers, and neither of them killed, neither of them hurt, neither of them a bit the worse, and both ready to begin again the following Sunday with exactly the same attack and exactly the same defence. There are some institutions—Christianity, the Church of England, the House of Lords, for instance—which invite and receive perpetual attacks, from which they emerge without the least hurt, so far as one can perceive. If they were all abolished to-morrow, what would the spouters do?

The car stopped again, and two girls mounted—two work-girls of the better sort—not, that is to say, the sort which wears an ulster and a large hat with a flaming feather in it: working-girls, dressed quietly and neatly. They ought to have been cheerful and even gay, for they were both young, both good-looking, both nicely dressed, and it was Sunday afternoon, warm and sunny. Yet they were not cheerful at all. One of them was in a rage royal, and the other, her friend, was in a rage sympathetic—quite a real rage. They were talking loudly on the kerb while they waited for the tram: they carried on their conversation as they climbed the stair: they continued it while they chose a seat, and before they sat down, without the least regard to those who sat near them whether they overheard or wished not to hear—or anything. They were wholly occupied with themselves and their rage and their narrative. They neither saw nor heeded any one else—which is the way that the angry woman has.

"So I told her—I up and told her, I did. "Yes," I sez, "you and your fifteen hours a day and overtime," I sez—"and your fines—so as to rob the poor girls of their money, and your stinkin' little room, as isn't fit for two, let alone a dozen—and your flarin' gas," I sez, "to choke us and poison us—and your dinners—yah! your dinner," I sez—"fit for pigs; and your beast of a husband comin' round with his looks and his leers"—"You let my husband alone," she sez—"his looks and his leers," I sez. "Some day the girls'll take him out and drown him head first, in the gutter," I sez. "And a good job too!"

"You didn't say all that, Liz?" asked the other, admiringly. "My! What's she say to that? Her "beast of a husband?" And his looks and his leers? Did you really, Liz, and her that jealous?"

"I did. Oh! I let her hear it. For once, she did have it. Then I took my money and I went off.—Never mind what she called me; that don't matter. She got the truth for once."

"What do you make of this, disciple?" asked the Master.

"It seems a quarrel between the girl and her employer."

"These are the makers of Property. They are not the soldiers who defend it. They are those who create it. The girls are employed by the sweater, who stands on the lowest rung of the ladder of Property, and steals the things as fast as they are made."

"One of them has been turned out. What will she do? Will she find another place?"

"I don't know. What becomes of the young? It is a difficult question. No one knows. Some say this and some say that. We know what becomes of the old when they are turned out. They die. But as for the young, I know not. You are young, and you are a woman. Go among the young women who have been turned out and find for yourself—for the world—what does become of them."

They passed an immense churchyard, with an ancient church standing in the midst—the churchyard now cleared of its headstones and converted into a beautiful garden, after the modern fashion, in which we have abandoned the pretence of remembering the dead, and plant

flowers and turf above their graves for the solace of the living. Why not? Let the nameless dead be remembered by the nameless dead. Their virtues, if they had any, may live after them in their descendants.

"See," said Mr Edmund Gray, moralising. "Here they lie, those who are soldiers of Property and those who are slaves of Property. They are mostly the poor of their parish who lie in that garden. No headstones mark their grave. They were born: they toiled for others to enjoy: and they died. Is this the life that men should most desire?"

"Nay," said the disciple. "But there must be strong and weak—clever and dull: there must be inequalities."

"Yes. Inequalities of gifts. One man is stronger, one is sharper, one is cleverer than another. Formerly, those gifts were used to make their possessor richer and more powerful. The strong man got followers and made slaves. The clever man cheated the dull man out of his land and his liberty. Henceforth, these gifts will be used for the general good. Patience! You shall understand all in good time."

He stopped the tram, and they descended.

Lying east of the Hampstead Road and Camden High Street, and bounded on that side by the canal—the great space occupied by the Midland and Great Northern Goods Depôt, by gas-works, wharfs, and railway arches, there is a network of streets very little known to any but the parish clergy. No part of London is less interesting than this district. It used to be called Somers Town, but I think that the old name has almost died out. It is about a hundred years old, regarded as a settlement: it possesses three churches at least, two workhouses, one almshouse, and three burial-grounds turned into gardens. It is also cheered by the presence of a coal depôt. Many small industries are carried on in this quarter: there are many lodging-houses: the streets are rather grimy, the houses are rather shabby, the people are rather slipshod. They are not criminals: they are, in a way, respectable—that is to say, tolerably respectable. It is not a picturesque suburb: dullness reigns: it is a dull, a dull, a dully dull quarter. There are children, but they lack mirth: and young girls, but they lack the spring of youth: one would say that there was a low standard in everything, even in the brightness of dress: the place looks better in winter than in summer. To-day, the bright sunshine only made the shabbiness of the streets more shabby.

"Is your place here?" asked Elsie.

"Yes; it is here.—You wonder why I came here. Because the people here are not all working-people. Some of them are small employers—those of whom I spoke—who stand on the lowest rung of the ladder and steal the things as fast as they are made, and take toll, and hoard them up. The working-man is generous and open to others, compared with these people. I planted my place down in the midst of them. But you shall see—you shall see."

It was like a dream. Elsie walked beside her conductor. Yesterday she made the acquaintance of this man for the first time: she had never seen him before except in his sane condition: he was a mad man—a real dangerous madman—stark

staring mad: he was taking her she knew not where—to some place among strange people: she walked beside him without the least fear. She who would have fled before the most harmless lunatic; and she was going with him as his disciple.

'George,' she said afterwards, 'I do not know how it happened. I could not choose but go with him. I could not choose but to become his disciple: he compelled me. I lost my will. I even forgot that he was a madman: I gave up my reason and all: I followed him, and I believed all that he told me. How did he get that power? Directly I left him, I became myself again. I perceived the mad enthusiast. I saw Mr Dering caricatured and proclaiming foolishness. But in his presence I was his servant and his slave.'

'Here we are,' he said. 'This is my Place. Let us go in.'

SUNFLOWER-FARMING IN RUSSIA.

It has been noticed as a curious fact in connection with the famine in Russia, that almost the only crop in the stricken provinces which last year reached respectable dimensions was that of Sunflowers. Yet the cultivation of the sunflower on a commercial scale is quite a modern industry, and the extent of it is even now but little understood in this country. The first province in Russia in which the cultivation began was Voronesh, where a farmer called Bokareff began, in 1842, to grow sunflowers in his fields for the sake of the seeds, or rather for the sake of the oil which he expressed from the seeds. His example was followed by his neighbours, and Voronesh became, as it is now, the great centre of sunflower cultivation in Europe.

From Voronesh the industry gradually extended to the adjacent provinces of Tambov and Saratov, of Simbirsk and Samara—in fact, to the great Volga basin, which has been the scene of so much privation and distress through the failure of the wheat-crops. In the whole of South-east Russia the sunflower has within the present generation become a prominent product of most of the farms. To show the rapidity with which the cultivation has spread, it may be mentioned that while, in 1881, there were 367,800 acres of Russian land under sunflower crops, in 1887 there were about 704,500 acres—nearly double.

One can hardly find an adequate representation of the fruits of this large acreage in the export lists of Russia. The oil which is made from the seeds is now almost entirely consumed at home. In 1885 some hundreds of tons of the oil were exported; but since then the quantities sent beyond the Czar's dominions have been insignificant. On the other hand, the residuum which remains after the oil has been all, or nearly all, expressed, makes excellent feeding-stuff for cattle, and under the name of 'Sunflower Cake' is shipped to the extent of about forty thousand tons per annum, chiefly to Great Britain, Denmark, and Germany; Sweden also takes a great deal, but Great Britain and Denmark are the largest consumers. The value of sunflower cake at the place of production is, roughly, about four shillings

and sixpence per hundredweight; but of course there are heavy charges for land and sea carriage before it reaches the consumer.

All the sunflowers grown are not suitable for oil-making. In fact, the farmers cultivate two kinds—one which has small seeds, which yield a large percentage of oil; another with large seeds, which yield little oil, and are consumed by the peasants and the poorer towns-people, as our own people consume hazel-nuts, that is to say, as a sort of cheap luxury. These large seeds are in great favour; and one can well imagine that, whether palatable or not, they must contain a good deal of nutritious matter.

The sunflower oil expressed from the smaller and richer seeds is extremely nutritious, and has a pleasant flavour; so much so, that it has now almost entirely superseded olive and rape oil in Russia for culinary and domestic purposes. When the grower himself is rich enough to be able to put up an oil-press, the combined business of cultivation and oil-making is said to be very profitable. These cases, however, are comparatively rare; and it is most usual for the farmers to sell the seeds to regular oil-producers, who set up their mills in some convenient district. Of late, the tendency has been to concentrate this industry in the larger towns of each province.

One reason why the cultivation has so rapidly extended is that it has a double basis. Thus, while there is a constant and growing demand at home for the oil, there is also a constant and growing demand abroad for the residual cake. Besides these two products, the shells or husks of the seeds form a valuable article of trade as fuel, where wood is scarce. And still further, the seed 'cups' are prized by farmers as food for sheep. There are thus four sources of income in the sunflower plant.

It has been said that land under sunflower crops yields about twice as much in money-value per acre as land under any other crops cultivated in Russia. This estimate we have no means of testing; but it is noteworthy that, as a rule, sunflower culture is more in the hands of the peasants than of the large farmers. Thus it has probably not yet been tried in a systematic and scientific manner, and on true commercial lines.

The sunflower for proper development needs a fertile and yet a firm soil. The stalk of the plant will grow to a height of eight feet, and will be two or three inches in diameter. It will have many 'heads,' or flowers, measuring sometimes more than a foot in diameter, and holding, perhaps, a couple of thousand seeds each. A mixture of black mould and sand is said to form the best soil for the plant, which in thin soils yields small flat seeds, instead of the round and heavy seeds which indicate fullness of oil. The sunflower does not thrive on sandy soils, both moisture and a firm support for the weight of the plant being needful to good growth. Another thing is, that it is not, on account of its size, adapted to exposed situations, and has to be cultivated on low and sheltered lands. It thrives best on low lands near a river, where it can get plenty both of warmth and moisture. It also thrives well after crops of rye and oats, if the soil is not too much exhausted.

The method of cultivation, however, is somewhat erratic, and is the subject of much difference

of opinion. Some of the Russian farmers invariably sow sunflower after wheat or rye, and others only after oats. Others, again, advocate sowing after clover; and some consider it most profitable to put sunflower into land which, after five or six crops, has lain fallow for a couple of years. On the other hand, it seems generally admitted to be a mistake to sow grains immediately after a sunflower crop, an interval of a year being necessary to rest the land.

A very common yet curious practice among the farmers of the province of Voronesh is to sow sunflower in the same fields for seven years in succession; then to sow buckwheat; and then, after a year's rest, rye.

The seeds are of various kinds—white, gray, brown with gray stripes, and black. The black is avoided as containing too much colouring to yield a pleasing oil. Then there is division into large and small classes. The small seeds, something like the shape of coffee beans, yield the most oil, and therefore fetch the highest price. The large seeds sell at a lower price, and in proportion to their virtues in taste, smell, and weight.

A careful sunflower farmer buys or selects his seeds in the autumn, choosing the ripest, and hanging up the seed-cups in a dry place for the winter. In the spring he shakes the seeds out of their cups, dries them in an oven, and puts them aside for sowing. The proper time for sowing is in early spring as soon as the snows have melted; but in some parts of Voronesh the seed is sown at the very end of autumn, too late for it to sprout before winter. In spring-sowing the seeds are not put very deep, only about a couple of inches below the surface, and about six inches apart, in rows. On the larger farms, or where labour is scarce, it is often, however, sown broadcast, although the sowing in rows both produces the best result in the plants and allows of the ground being more easily kept clear of weeds. Good seed should sprout and reach the surface in about eight days, the first sprouts being like those of the cucumber. After a fortnight or so, thinning is necessary, so as to preserve a space of about a foot and a half between the plants. When these reach the height of about six inches, the field is very carefully weeded. When they have grown to three feet or so, the offshoots are cut away, leaving only four or five flowering heads on each stalk. And this is said to be all the care needed until the crop is ready for harvest.

The harvest-time varies with locality and character of soil. In the south part of the area we have described, the crop ripens about the middle of September; in the north, from a fortnight to a month later. In Voronesh, harvesting is earlier than elsewhere—on the best lands about the middle of August. Even that is later than the grain-crops in Russia; and one advantage of sunflower farming is that the harvesting does not interfere with the ingathering of the other crops. Care has to be taken not to allow the sunflowers to become over-ripe, for when the flower withers the leaves covering the seeds drop off and the seeds crack open.

On small farms, where hands are few, the ripe heads are cut off first, and the rest of the field in stages as it ripens. The flowers so cut are spread out on the ground all day; but are

covered up and placed under shelter at night until they are quite dry. Then the stalks are cut off and piled away for firewood. For large farms this process is too slow, and the plants are cut off at the bottom of the stalk and piled with the seeds upwards until they are quite dry. This method, however, is said to be inferior to that of the small farmer, inasmuch as it leaves a considerable proportion of unripened seeds, which deteriorate the quality of the oil. Others cut the seed-cups, but leave them on their own stalks to dry.

Consul-general Crawford, in reporting to the United States Government lately on the agricultural industries of Russia and the methods of farming practised, refers to the harvesting of sunflowers as we have described. He says: 'These are the methods most generally adopted by the large farmers, as their imperfect methods of farming do not enable them to handle such large crops without a sacrifice of quality. The same criticism obtains also in the methods of harvesting wheat, rye, and other cereals. In comparing the two methods of harvesting sunflowers most generally adopted by the large farmers, it will be seen that in cutting the plant at the root the field may be cleared promptly, whereas when the stalks are left the entire field must be gone over twice in order to clear it. Then, too, the stalks left in the field form a regular forest, greatly interfering with the work of carrying off the seed-cups. On the other hand, this method has the advantage that the seed-cups, being left on their own stalks, are dried quicker and better than those stored in piles, and that in carrying away the heads without the stalks no seeds are wasted.'

The drying and airing of the sunflower in large heaps is not desirable. The heads when piled away tend to destroy the seed by their weight, and the want of fresh air encourages mildew and decay. The mode of drying the seed in the open air adopted in Russia is generally defective. The head which contains much moisture does not dry well, but withers easily under the influence of the air and the sun, and is apt to be ruined by rains. Thus the Russian farmer is often glad to get even a half-crop of oil from a full crop of seed. The plan recommended, but not yet adopted to any great extent, is to erect drying-sheds for the proper curing of the seed.

Thrashing begins as soon as the flower is dry. Here, again, the method differs according to the size of the farm. The small farmer whips the seed-cups one by one with a stick, so as to shake out the seeds. The large farmer uses the flail; but what he gains in speed he is apt to lose in quality, for when the shells get broken, as they frequently do with the flail, the seed becomes bitter, and so deteriorates the oil. When the thrashing is finished the seeds are screened, or fanned, to drive off the superfluous matter; and then, after being thoroughly dried, either in the sun or in kilns, are sorted, by means of gauze-screens, into sizes.

The larger seeds, which form the larger portion of the crop, and of which a single acre of sunflowers may yield as much as 2700 pounds, are sold to dealers, who retail them among the peasants and labourers. The consumption is very large, and the trade is becoming a very considerable one. The smaller seeds are sold to the oil-

mills, when the farmer has not a press of his own. The average yield of an ordinary sunflower farm in a favourable locality is about 900 pounds of oil-seed and 1400 pounds of edible seed to the acre of plants. While this is about the average, some farms are specially rich in the oil-seed, and have been known to produce 2000 pounds of that quality to the acre, yielding about two and a half hundredweight of oil.

This oil, when expressed from well-cultivated and carefully-treated seed, should be as delicate in colour and flavour as the best salad-oil of France or Italy. In Russia it has completely taken the place of poppy-seed oil and hemp-seed oil, which, while cheaper than olive, were coarser and ranker. But these oils have now almost completely gone out of use in Russia, where the pure and delicate sunflower oil at present reigns supreme for table purposes.

The treatment in the oil-mills is very simple. The seed as brought in by the farmers is sorted and thoroughly cleaned; then it is passed through millstones, which simply crush the shells and release the kernels. These are separated from the husks, dusted, and put into a press and mixer. From this emerges a pasty mass, which is put through vessels heated by steam to soften it. From these it is lifted, and, wrapped in thin camel-hair cloth; is put under another press, which squeezes out the oil into pipes, which convey it into tanks.

The large oil-mills are now driven by steam; but until comparatively recently they were all worked by hand. There are now between eighty and a hundred mills in Russia devoted to sunflower crushing alone. The largest is at Saratov, and is capable of turning out a large quantity of oil annually. The production of the public mills is computed at about 10,000 tons per annum; but there is no record of the very large aggregate production of the small farmers and peasants who practise oil-crushing at home in a primitive fashion. Two kinds of oil are produced. The best is sweet and clear; the inferior is slightly bitter and is darker in colour. The residual oil, or 'foots,' is not used for the table, but finds a ready sale for certain industries. The value of the oil-yielding seed of good quality is about seven shillings per hundredweight, or just about one-half of the customary price five or six years ago. Of course it varies with the market-price of the oil, which, again, is affected by the supply of other table oils.

The stalks of the sunflower plants are preferred as firewood to pine-wood. They produce a bright hot flame quickly, and form a pleasant and fragrant fire. An acre of sunflowers will yield about a ton of this useful firewood, a great consideration in a sparsely-wooded land. The seed-shells are also used for heating purposes, chiefly in cooking-stoves.

As the sunflower is rich in potassium, even the ashes have a commercial value for fertilising purposes. Thus, all the waste vegetable matter, after the harvesting and pressing, is burned, and the resultant ash is either used on the fields as a manure, or sold to the soap-works, if there are any in the neighbourhood.

The uses of the sunflower oil-cakes for cattle-food, and of the ground seed-cups as sheep-food, have already been mentioned.

This valuable, beautiful, and interesting plant is liable to a disease which has been traced to a parasite similar to that which attacks corn-plants. It causes a sudden withering of the leaves in the middle of the season, and a shrivelling up and drooping of the heads. When disease has once appeared on a field, experience has shown that it is best to burn everything on the land immediately after the seed has been harvested. Either that, or to sow grain, and sow the sunflower afresh in a new field at some distance.

As to the effects of sunflower culture on the soil, an extensive Russian farmer assured Consul-general Crawford that while all oil-producing plants seem to exhaust the land, the sunflower does not. He has repeatedly found that wheat and oats sown after sunflower (presumably after a short rest) have been better crops than when sown after other plants. This would imply that not only does the sunflower not exhaust the land, but that it actually enriches it. Other Russian farmers have confirmed this opinion, and especially maintain that wheat grows very much better after a sunflower crop. This is a point well worthy of examination and practical test by British and American agriculturists. Whether it would pay to grow sunflowers in this country in the absence of a market for the edible seeds, is problematic; but if the ground is to be enriched by the experiment, it is surely worth making in suitable localities.

JACK MOORE'S TEMPTATION.

CHAPTER III.—CONCLUSION.

JACK rose, still debating with himself as to whether he should or should not allow the temptation to overcome him; then he changed his coat, took his hat, and went out into the street. The misdirected letter was in his breast-pocket; he was making a sort of compromise with himself; he would not destroy the letter, nor would he send it on to its rightful destination. He would consider the matter further during the day. A City omnibus passed him, and as the morning was fine, there were more outside than inside passengers. Jack hailed it, jumped in, and then suddenly a sort of electric shock went through him, which caused him momentarily to forget all about his uncle, the misdirected letter, and his own alternate battlings against and parleys with temptation. For he found himself seated opposite the young lady with the gray eyes, the young lady whose fare he had paid some weeks ago.

Events were falling out strangely that morning. For weeks he had been watching for a chance of seeing Miss Mirah Lester, in the hope that she might acknowledge their informal acquaintance by at least a bow and a smile. Now, on the very day that had brought him face to face with temptation, they met. Would she remember him? He looked across at her inquiringly. She was reading; but she seemed to feel his earnest glance, for she suddenly looked up, blushed, smiled divinely, and then held out her hand. 'I have so wished to thank you again for your timely loan,' she said, 'and to—repay it.'

Jack was hardly conscious of the money she

gave him, for a sudden overpowering sense of shame and self-contempt seized him. He felt as if the steady, candid gaze of Mirah Lester's gray eyes penetrated through the cloth of his coat to the letter in his breast-pocket. The touch of her little gloved hand seemed to possess some magic power, to make him see things in their true light and rightly to estimate his own mental attitude.

He stammered out some entirely inane rejoinder. What would she think of him if she knew how near he had been to suppressing and destroying a letter that had come into his hands by chance? which, therefore, should have been doubly sacred to any honourable man. How terribly base he would seem in her eyes, if she guessed that he had coldly reckoned on the death of the man who had filled a father's place in his life!

The young lady, being quite at a loss as to the real cause of her fellow-traveller's manifest agitation, imagined him to be the victim of bashfulness. So she resumed her book, in happy ignorance of the violent revulsion of feeling she had roused in the breast of the man opposite to her, and of the momentous result brought about by their meeting.

As on a former occasion, the young lady got out at the corner of Wellington Street. By that time Jack had regained sufficient self-possession to be able to respond to her parting 'good-morning;' then he, too, alighted from the omnibus and bent his steps towards Lincoln's Inn Fields. He had quite made up his mind to act fairly and squarely in the matter of the mis-sent letter. But on arriving at Mr Pouncemore's office, he learnt that the lawyer was not expected there until twelve o'clock. So for an hour or more Jack paced round and round the dingy garden honoured by the appellation of 'Fields,' thinking of all that had happened, and all that he had been saved from, during the past two hours.

When all the church clocks in the neighbourhood had lifted up their variously-toned voices to announce the birth of another noon, Jack again entered the lawyer's office.

Mr Pouncemore was a tall, thin old man, nearer seventy than sixty, dressed in black clothes of old-fashioned cut. His manners were as much out of date as his garments, for he had an almost Grandisonian courtliness of address; his bows were bows, not the jerky nods, or careless touchings of hat-brims, or snatchy doffings, peculiar to this last quarter of the century.

Mr Pouncemore was not, perhaps, quite so keen of eye or so acute of brain as he had been twenty or even ten years ago. He found it necessary to rub his spectacles a good deal, grumbling as he did so at the quality of the lens supplied by the opticians of to-day. Ten years ago spectacles were spectacles. He was besides a trifle deaf, and, not liking to admit the fact, frequently made crooked answers to remarks addressed to him; and nothing vexed him more than that a client should manifest impatience at his slowness of speech, or notice the difficulty he had in seizing the various 'points' in a case. Mr Pouncemore was, in fact, getting past his work. He depended more and more on his head-clerk, a young man of considerable acuteness and resource.

Mr Pouncemore received the nephew of his old friend Tredinnick with his customary urbanity, listened courteously to his explanation as to how the letter intended for him had come into Mr Moore's possession, though he certainly failed to understand all the young man said.

'I received by this morning's post a letter written by my uncle to you,' said Moore, raising his voice and speaking in slow, stentorian tones.

'Your uncle wishes to see me? Certainly. At what hour shall I call on him?' replied the old lawyer suavely.

'This letter is yours—it came to my address by mistake—by *mistake*,' shouted Moore, beginning to lose his temper.

Mr Pouncemore stared.

'Mistake—no; I am not in the habit of making mistakes, sir.'

'Not *your* mistake—my uncle's. He put your letter into an envelope addressed to me, and mine into one addressed to you.'

'He couldn't do better than address himself to me,' commented the lawyer, drawing up his stiff backbone.

'Did a letter intended for me come to your address? If so, it was sent to you by mistake—by mistake,' roared Moore. ('Deaf old idiot!' This in a much lower tone.)

'Deaf! I'm not deaf. Who said I was deaf?' rapped out Mr Pouncemore, glaring at his visitor. —'Jackson! Jackson!' he called out.

The head-clerk answered his chief's summons with suspicious celerity. It was indeed his habit to listen at the door of Mr Pouncemore's sanctum, that he might be at hand to put matters straight when complications arose between client and adviser. Besides, Mr Jackson derived a good deal of malicious amusement from listening to the game of cross-questions and crooked answers which was so frequently played in Mr Pouncemore's private room.

'This gentleman has come to complain of some mistake about a letter he wrote to me,' said the lawyer with dignity.

'This morning I received a letter written by my uncle, Mr Tredinnick, to Mr Pouncemore—a letter which was unfortunately put into the wrong envelope,' explained Moore impatiently. (Here he held out the letter in his hand to the clerk.) 'I opened and read it, for, as you see, it was addressed to me.'

The clerk took the letter. 'I understand. I will explain the matter to Mr Pouncemore.'

Jackson, long accustomed to suit his voice to his employer's tympanum, managed to convey to him why Mr Tredinnick's nephew had called.

'Yes—yes; I understand,' Mr Pouncemore said, brightening. 'Mr Tredinnick has made a mistake—a mistake excusable at his age; but,' he added, staring at Jack through his gold-rimmed spectacles, 'you have also made a mistake in supposing that a letter intended for you reached me.—I think I am right—am I not, Jackson?'—in saying that no misdirected letter came to the office this morning?' he added, turning to the head-clerk.

Jackson bowed deferentially, glancing askance the while at the young man, who, in his opinion, was behaving in a most singular not to say suspicious manner.

'Then,' said Jack, rising, 'I must apologise for

my intrusion on your time. I—I thought it right to bring you the letter that came into my hands under such—peculiar circumstances with as little delay as possible. The letter is now in your possession, so I have only to wish you good-morning.

'Good-morning,' replied Mr Pouncemore, extending a formal hand for Jack to shake. He was determined to show this bad-tempered young man what he thought of his ungrateful conduct towards his uncle.

Jack left the office with slow heavy steps. He knew that he had elected to follow the steep and thorny path; that he had mastered and trampled under foot a great temptation. But as he set his face towards the great, purple, cross-crowned dome of St Paul's, the inevitable reaction resulting from strong emotion set in, and a dull feeling of depression and hopelessness took possession of him. He had done right; but the consciousness that he had acted as became an honest man did not at the moment bring its own reward, for when he reached his office, he received a severe reprimand for his lapse from punctuality; and as he took his seat at his desk, no inspiring hope of a happier future brightened the commonplace drudgery of the present.

The day passed, and he went home to his lodgings thoroughly tired out. But next morning he rose early and walked down to Russell Square. The sight of the well-remembered house, even though he knew it to be now tenanted by strangers, restored the balance of his mind, and brought back some measure of his former light-heartedness.

On reaching home that evening he found a letter awaiting him, addressed in a lady's handwriting. He tore it quickly open, and read as follows:

THE BAY TREES, WIMBLEDON, Nov. 20, 188—.

MY DEAR BOY—I have heard from Mr Pouncemore how you behaved with regard to a letter I wrote to him, and which reached you by an accident, for which I shall never cease to thank God. If you will come down here as early as you can to-morrow morning, I will explain how the mistake occurred.—Your affectionate uncle.

The letter was signed in rather shaky-looking characters—

EDWARD TREDINNICK.

Jack read the letter with quickened pulses and beaming eyes, wondered a little who had acted as his uncle's amanuensis; then folded it up and put it in the pocket where that other letter had lain, when truth and honour and right feeling were weighing in the balance against wealth and ease—and dishonour—and the glance of a girl's candid eyes had made the balance dip on the right side.

Jack went down to Wimbledon by the first train from Waterloo, and reached his uncle's door by nine o'clock. The Bay Trees was a pretty, snug-looking villa, standing well back from the road behind the two big trees which gave the house its name. As Jack lifted the latch of the white-painted entrance gate, his heart beat fast with mingled excitement and apprehension. The door was opened by the old butler Thrupp.

'Why, good gracious me! it's Master Jack—well! And I'm glad to see you back again, sir.'

'How is my uncle?' asked Jack, rather shamefacedly.

'Better, sir—much better. He cheered up wonderful after Mr Pouncemore's visit yesterday morning.—And now the sight of you will do him more good than all the champagne and physic the doctor orders.'

Jack was ushered straight into his uncle's presence. He paused for an instant on the threshold of the room, for he was startled at the change two years had wrought in the hale, hearty old man. 'Uncle!' he cried impulsively—'my dear, kind, old uncle!'—He stopped, fairly overcome, for the sight of his uncle's altered face and the unconscious pathos of the drooping figure seated by the lonely fireside, unmanned him.

'Jack!' The old man rose, tottered towards him, and fell on his neck with a sobbing cry of: 'Jack, my boy, forgive me. I was too hard. Oh, my dear, dear boy, thank God that He has brought you back to me at last!'

When Mr Tredinnick could command his voice, he told Jack how he had made the fortunate error which had led to their reconciliation. On the day when he wrote his letter of instructions to Mr Pouncemore, he addressed an envelope to Jack, meaning to enclose the quarterly cheque; but after doing so, he found that his cheque-book was empty, and the directed envelope had been left in his blotting-book. In the hurry of the moment he had thrust the letter to the lawyer into the cover addressed to Jack, leaving, as he afterwards discovered, that directed to Mr Pouncemore in the blotting-book.

'And now I must give old Jack Pouncemore a new set of instructions,' he finished with a smile that beautified his harsh features and shone like winter sunshine in his faded eyes. 'But the sight of you has put new life into me, my boy, and I don't think you'll have to pay your succession duty just yet.—Oh, there's a ring at the bell. My reader and amanuensis, Jack, the kindest and best of girls, who creams all the newspapers and writes my letters—most of them, at least. Not private instructions to my lawyer, of course.'

Just then the door opened, and Thrupp announced 'Miss Lester.' And to Jack's utter delight and astonishment, in walked the young lady with the gray eyes—Mirah Lester, his good angel.

CALLOW FLIGHTS OF FAMOUS WRITERS.

No page in the biography of an author who has 'witched the world with noble penmanship' is more eventful than the one which contains the records of his *debut*. Indeed, a goodly book might be written recounting the years of study and anxious thought that have intervened in the lives of most writers—the sleepless nights and days of vexations—before this goal could be reached: the fruitless search after a publisher for a first work—after an editor even who might chance to discover some merit in a poem, article, or story. And then, when he at last sees himself in print, with what zest he cuts the leaves and devours the pages! Not that he reads one word

for the sake of novelty. On the contrary, every sentence, most familiar to him, awakens a crowd of recollections in the past. The room—possibly a gloomy garret—in which the idea was conceived and carried out is brought vividly to mind. He reads between the lines; nay, more; he weaves a romance of future fame, destined, perhaps, never to stretch beyond the bounds of his own inner consciousness. No second success, any more than a second love, will awaken the same emotion; only those who have gone through the ordeal can fully appreciate the experience. Dickens, when dropping his manuscript stealthily 'one evening at twilight, with fear and trembling, into a dark letter-box in a dark office up a dark court in Fleet Street,' and his subsequent agitation 'when it appeared in all the glory of print,' is a striking instance of an author's ecstasy over his first literary flight. 'On which occasion,' Dickens has told us, 'I walked down to Westminster Hall, and turned into it for half an hour, because my eyes were so dimmed with joy and pride that they could not bear the street, and were not fit to be seen there.' It was a copy of the *New Monthly Magazine* for January 1834; and it contained the first sketch by Boz, called 'A Dinner at Poplar Walk.'

And then, by way of contrast, what desperate thoughts must sometimes enter an author's head when his first work is returned! What a pathetic picture is conjured up when one thinks of Thackeray wandering about with the rejected manuscript of *Vanity Fair*, for it was a serious question with the novelist whether he should try another publisher or cast his manuscript into the fire. Even a picture of Goldsmith in Wine Office Court toiling over his story of the *Vicar of Wakefield* could scarcely be more touching. It would be well, perhaps, if authors could be more philosophical, snap their fingers at the age, and exclaim with Charles Lamb, 'I will write for antiquity.'

In an article on 'Newspapers Thirty-five Years Ago' there is a realistic sketch by the author of *Essays of Elia* when he was making his first callow flight in authorship, writing *John Woodvil*, and 'hitting off a few lines almost extempore' in imitation of Burton, with a view to adding a trifle to an income barely sufficient for the support of himself and his sister in the Chancery Lane garret. In those days, he tells us, every morning paper kept an author, who was bound to furnish daily a quantum of witty paragraphs. 'Somebody has said,' he adds, 'that to swallow six cross-buns daily consecutively for a fortnight would surfeit the stoutest digestion. But to have to furnish as many jokes daily, and that not for a fortnight, but for a long twelvemonth, as we were constrained to do, was a little harder exaction.' Of all that galaxy of rising young authors that were to be picked up at Westminster Hall, in Lincoln's Inn, at Charles Lamb's supper parties in his smoky chambers in the Temple at a later date, and in the gilded saloons of Holland House, none, apparently, gave Jeffrey more gratification than Macaulay, known in those days as 'Sidney Smith's recruit.' It was indeed that brilliant article on Milton—Macaulay's first flight in the *Edinburgh Review*—that attracted public attention to this famous essayist.

It was Jeffrey—whose admiration for Macaulay

was unbounded—who lent Carlyle the fifty pounds which enabled him to take the manuscript of *Sartor Resartus* to London in order to arrange for its publication. It was offered to several publishers, but all in vain. The manuscript went back to Scotland unsold. But that visit to London led to Carlyle's getting work and making friends; and *Sartor* presently made its appearance in *Fraser*. It nearly ruined the magazine; for people did not understand the author, and took him to be little less than a lunatic.

In his *Recollections of Writers*, Charles Cowden Clarke tells how, when walking to London to see Leigh Hunt—who had just fulfilled his penalty of confinement in Horsemonger Lane Prison for the libel upon the Prince Regent—he met Keats, who accompanied him part of the way. At the last field-gate, when taking leave, Keats gave him the sonnet entitled, 'Written on the Day that Leigh Hunt left Prison.' It was the first proof he had received of Keats's having committed himself in verse. 'How clearly do I recall,' he writes, 'the conscious look and hesitation with which he offered it!—there are some momentary glances of beloved friends that fade only with life.' It has been stated, however, by Keats's biographer that 'The Lines in Imitation of Spenser' are the earliest known verses of his composition. The first that Keats ever published was the sonnet beginning, 'O Solitude! if I must with thee dwell,' which appeared in the *Examiner* in 1816. In the following year, amid the most fervent anticipations of his literary circle, the first volume of Keats's poems came out. But it never passed into a second edition. The first was but a small one, and that was never sold off.

Coleridge's first appearance as a poet was under peculiar circumstances. During a walking tour, he had made the acquaintance of Southey. Both young men were ardent republicans, and enthusiasts about the French revolution. This meeting inspired Coleridge with the idea of writing his dramatic sketch, 'The Fall of Robespierre.' Like Wordsworth, and in fact most youthful poets of the time, he was a violent republican, and hailed the revolution as a new and glorious era of liberty. An incident also happened to Wordsworth which doubtless shaped the course of his after-life. He was returning at daybreak from a party of dancing and gaiety, when a sunrise of 'extraordinary splendour and magnificence burst upon his enraptured vision and melted his very soul.' He had never seen a more glorious spectacle.

My heart was full; I made no vows, but vows
Were there made for me.

An *Evening Walk* was composed—almost his first poem. There was not an image in it, as Wordsworth has himself affirmed, that he had not drawn from his own observation of Nature; and what he has said of this volume is true of all his poetic work.

'The first of my poetic offspring that saw the light,' says Burns in his autobiography, 'was a burlesque lamentation on a quarrel between two reverend Calvinists, both of them dramatis personæ in my *Holy Fair*.' It brought him notice as a 'maker of rhymes.' It was not until the summer of that year, according to his brother

Gilbert, that the thought entered Burns's head of becoming an author.

With Byron, poetry was still more distinctly an after-thought. The first volume of poems which he sent to the press was published in a spirit of caprice; for he intimated beforehand to his friends that in writing it he had 'never looked beyond the moment of composition,' and that 'poetic fame was by no means the acmé of his wishes.' And it is not improbable that, but for the *Edinburgh Review*, the *Hours of Idleness* would never have been heard of beyond two or three London drawing-rooms. But even the most malevolent critic is, after all, of some service to a gifted writer: he awakens latent energy; he lays bare faults which the flattery of 'friends' hides from him. But few articles ever produced such an effect as this far-famed one produced on Byron. Had this review never appeared, he might have trifled as a poetaster for half-a-dozen years, and then turned his attention, in all probability, to politics.

A thin quarto volume of translations from the ballads of Bürger was the book with which Walter Scott made his first appearance in the field of literature, in which he was destined to gain so great a name. This flight was not a very brilliant one; and it would be no easy matter now to find a copy of the work. Hardly any notice was taken of it by the press. No critic of the day discovered any trace of talent, though it was distinguished by many terse and vigorous lines and many striking metaphors. It was a failure, and in marked contrast with the triumph of Tom Moore, who at this time was preparing to risk his flight with the *Odes of Anacreon*. The manuscript lay in the bottom of Moore's travelling trunk when he turned his back on the cloisters of Trinity College, Dublin, and started for London. He had set his heart upon publishing the work by hook or by crook, if he could only find a bookseller to take it upon any terms. 'I can scarcely expect more than a free publication,' he writes, 'as poems are really, in the present state of the age, a heavy article on the publishers' hands.' He settled down in a front room up two pairs of stairs in George Street, Portman Square; and here he worked day and night, poring over the relics of the Teian bard, with Boyle on one side and Spaletti's *fac simile* of the Vatican manuscript on the other. He tested his translation, in fact, line by line. It was a long and tiring task. But with a man of Moore's nature and taste it was a labour of love. He put his whole heart into it; and many years after, when he was at the height of his popularity, the author of *Lalla Rookh* frequently took his friends to see the room where 'the first proof sheet that ever I received was put into my hands.' It was the proof that formed the groundwork of Moore's fame. His *Odes* ran through half-a-dozen editions in six weeks; and, like Byron, he woke up, in that garret in George Street, to find himself famous.

Before he had ceased to be a schoolboy, Shelley was author of a romance called *Zastrozzi*. The book bears upon its title-page the initials P. B. S. It was published when the poet was eighteen. It is a boy's attempt to surpass the pieces of contemporary fiction—romances of pseudo-passion written in staccato sentences, of melodramatic

prose. A publisher in Paternoster Row, it has been related, was venturesome enough to give forty pounds for it, with which the unfledged writer feasted eight of his schoolfellows. What a contrast to Chatterton—far more precocious even than Shelley—who made his callow flight in the poem called *Apostate Will* before he was twelve years of age! His pocket-book, found in the Holborn garret, discloses all the money he received during four months of his literary labour. It amounted to four pounds fifteen shillings and ninepence, including half a guinea for sixteen songs. But a greater portion of his work during these last days—as the same pocket-book reveals—was never paid for at all.

Lord Lytton, too, had scarcely attained his sixteenth year when *Ismael, an Oriental Tale, and other Poems*, was published. While at Cambridge, where he wrote his prize poem on 'Sculpture,' he occupied the long vacation by wandering over a large portion of England and Scotland on foot; and it is not improbable that the experiences gained during such a ramble, and his subsequent journey through France on horseback, first gave rise to his idea of appearing as a novelist. *Falkland* was published anonymously. It was a story which is said to have cost the author more trouble than any of his subsequent novels; and it certainly contains the germ of many after-creations.

At the time that Disraeli threw up his clerkship with the firm of attorneys he was serving, it is recorded on good authority that he sought to be engaged as a political writer on the newspaper press. But though he never actually became a journalist, his literary powers did not long lie dormant. At the age of twenty-two he burst upon the world with his first novel, *Vivian Grey*, more remarkable, perhaps, for a youth of twenty than Congreve's *Old Bachelor*. Most of the story was written, it is alleged, even before Disraeli had reached his twentieth year, even before he had made a rather extended tour on the Continent. It was on his return from this journey that he found himself famous. The cleverness of *Vivian Grey*, its arrogance, its personalities, its thinly disguised portraits of living celebrities, hit the taste of the period, and the writer became the 'lion' of the London season. In after years, when created Earl of Beaconsfield, he endeavoured to persuade the publishers to exclude this callow flight in an edition of his works, but without success. *Vivian Grey* and its author were too well known for that.

It was when little more than twenty that Fielding began to write plays. In his time it was the most profitable kind of literature. His first attempt was *Love in Several Masques*, a comedy of the Congreve school. It was brought out at Drury Lane. The play was well received; and the author, who did not publish his great novel of *Tom Jones* until twenty years after, became a regular playwright. Before the age of thirty he had produced a great number of comedies, farces, and burlesques. None of these are now known, excepting perhaps the mock-tragedy of *Tom Thumb*, the translated plays of the *Miser* and the *Mock Doctor*. His famous work, *Tom Jones*, was composed under all the disadvantages incident to an author; and in the dedication

Fielding has intimated that without the assistance of Lord Lyttelton and the Duke of Bedford the novel had never been written.

There are great writers, on the other hand, who never even attempted a callow flight above the literary horizon—writers who have kept in their desks many pages of material upon all subjects—writers who have never thought fit to 'lay out their learning with the same diligence as they laid it in.' They preferred, in the words of Dr Johnson, to 'wait for clearer light and fuller discovery.' It may be that some authors, looking back upon their callow flights, as Disraeli looked back at his *Vivian Grey*, have wished they, too, had waited.

WITH IRON WILL.

BY THOMAS ST E. HAKE.

IN TWO CHAPTERS.—CHAPTER I.

My boat is lying motionless in a shady nook, and I am looking down dreamily into the stream. Scarcely a cloud crosses the blue depth of sky, and the reflected sunlight finds its way between the shadows of branches and clusters of leaves. It is an ideal landscape—a landscape trembling in liquid light and shade. I am still looking downwards into this sunlit, leafy scene, and living more within it than in the material world around me, when I become conscious of maiden eyes gazing up laughingly into mine. Never was lovelier face mirrored in Nature's looking-glass. The eyes are large and dark, with a liquid light of their own beaming between the black quivering lashes; the full lips are half parted with inquisitive surprise; and round the oval face there is a halo of reddish-brown hair resembling the autumn foliage in its russet tint.

The face is gone. A slight movement of my boat has blurred my watery mirror, and there is nothing more to be seen down there. So I return to earth. I glance up at the high bank under which my boat is moored, where the pendent branches almost meet overhead. I look round me with a vague hope that the face is not a disembodied shadow—a mere 'creation of a poetic fancy.' The landscape, which I had seen repeated in the river, is visible in all its actual beauty, with the sunlight breaking in between the leaves. But no laughing eyes now meet mine.

I sink down into my boat, but not with any sense of despair. I am hopeful of meeting my water-nymph again. I loose my boat, and let it glide of its own free will down stream; I have no thought of hurrying away. I am still in the deep heart of the wood, and this shady stream is its life, flowing gently through it.

I came out of this deep solitude at last. The river broadened; and I pulled vigorously up stream in the hot dazzling sunlight. Presently a pretty river-side inn was reached, and I was greeted by the landlady with a long pitiful face. Not that she suspected me of possessing a spark of romance. It was my dinner that troubled her. It had been 'put back,' as she expressed it, a dozen times, and was nearly spoilt. Nor did matters improve when she discovered that I had lost my appetite, and was even less inclined than usual to be talkative, or, more strictly speaking, to tolerate *her* talk. She naturally concluded

that her cooking was at fault. I hastened to assure her that it was 'the weather:' her cooking had nothing to do with it. She appeared pacified; and I now took the opportunity of putting a question which had been on the tip of my tongue all dinner-time.

'Who lives'—and I tried to speak with as much indifference as possible—'who lives in that fine park with a white house on the slope? That little river down stream, whatever it's called, runs through the property. Any one of importance?'

'Why, that's Waking Hall! Colonel Hethersett lives there.'

I allowed an exclamation of surprise to escape me, of which I soon repented. Not that I wished to hide from the landlady, for any deep reason, that the name of Hethersett was familiar to me. But I quickly realised that I had loosened her tongue. I knew all, more at least than she did, about the owner of Waking Hall; I was quite convinced of that. The question was: how to put an end to her loquacity? I dispensed with ceremony, if any was expected of me; so hastily left my seat at the table, and broke up the 'conference' by politely asking for a match. Scarcely pausing to light my cigarette, I made an escape into the open air, and turned my steps in the direction of Waking Hall.

Some ten years ago, while I was still a student at St Bartholomew's, in London, a serious affair had come under my notice. A man was brought into the hospital, late one night, seriously injured. He had been found in one of the by-streets in the neighbourhood of Smithfield in an unconscious state. It was apparently a case of attempted murder; though what the would-be assassin's actual motive had been for the attack—whether revenge or robbery—was never clearly ascertained. No robbery had been committed; and when my patient recovered, after some weeks of suffering, he threw no light upon the matter. I was in constant attendance upon him, and it was my unexpressed belief that he could have partially solved the mystery if so disposed. But he volunteered no explanation. The business was, so he declared, in his lawyer's hands; and it did not appear to be any one else's right to interfere. And yet I was deeply interested, not only in the case, but in the striking appearance of my patient, and many remarkable traits in his character. A word, often a mere look from him, would instantly obtain obedience. He never showed a sign of ill-temper; and yet he made one feel that he was naturally passionate, and that to attempt to provoke him would be a dangerous experiment. His very voice expressed his indomitable will. His name was Hethersett, as I now distinctly remembered: Colonel Hethersett, of Waking Hall; and on taking leave of me, he had extracted a promise that should I ever happen to be in the neighbourhood of Waking, I would pay him a visit. His name, even the name of the village, had almost entirely escaped my memory. Ten years in the midst of a busy professional life in London will force a man to forget everything except his immediate surroundings.

The twilight is nearly gone; the last rays die out as the clouds rise and cover the sky. The day is over; and when I gain the high-road, dark

and lonely with its steep hills on either side, it is night. At a turn in the road, and only a few yards ahead of me, I observe a broad streak of light stretching across the highway. On the hill-side, at the point from which the light appears to issue, bluish transparent flames rise like lambent tongues of fire towards the dark sky. As I approach nearer and come within the space of light, I find that it proceeds from a large limekiln standing back some paces from the road, and built against the hill. A man springs up suddenly from the ground. I accost him with a cheery 'Good-evening.' The watchman, as I conclude him to be, gruffly echoes my greeting. 'Why, my friend,' I venture to remark, 'you're warm enough here to roast an ox!'

'It is warm,' replies the watchman. 'But it is worse, much worse, on a blazing hot day, I can tell you. And that,' he adds, 'is one reason why I choose the night.'

I begin to feel that this great furnace by the roadside has a certain fascination for me. Its huge iron doorway is red-hot, and the fire within roars lustily.

'Does it need much stoking?' I inquire. 'It looks furious.'

'Ay; more stoking,' says the man, 'than you might suppose. I seem always at it. I never think o' taking a wink of sleep all night long. I lie down and smoke and watch. That's what I do: smoke and watch that fire. He needs feeding five or, may be, six times in the hour.—Looks hungry now, don't he?'

The man approaches the kiln as he speaks with a long pole in his hand. It looks to me like a barge pole with iron hook and pike.

'Do you live here?' I ask him; for I am growing interested in the man as well as the fire.

'Why, yes; that's my home,' and he jerks his thumb over his shoulder towards a small wooden hut beside the kiln. 'At daybreak my mate relieves me, and I turn in. You'll not often catch me coming out of my kennel, as he calls it, till after dark.'

'The life seems to agree with you,' and I glance, while saying this, at his muscular figure.

'Agree with me?' he repeats with an odd laugh. 'Ay; it suits my purpose, guv'nor. I don't complain.'

And now he pulls open the iron door, and through the chinks between the bars the fierce fire lights up his face. I have followed him while talking; but the intense heat forces me to step some paces back. He is in his shirt sleeves, which are rolled up almost to his shoulders. He is certainly a remarkably powerful-looking fellow, with the arms of a stalwart blacksmith. His beard is thick, and intensely red; and his small eyes have a fierce expression—which he may have caught from the fire—glittering under red bushy eyebrows; and as he presently lifts his cap aside, to wipe the perspiration from his brow with the back of his hand, I notice an ugly scar across his forehead.

He appears disinclined for further talk; so I bid him 'Good-night' and go on my way.

When I reach Waking Hall, a few minutes later, I am shown into a luxurious smoking divan. The room is lit with lamps, the green shades being of some semi-transparent texture

which gives to every object a subdued appearance. The walls are thickly ornamented with spears and guns and a dozen other warlike implements. I have scarcely time to glance about me, and get confused ideas of hunting scenes and jungles, when a step on the terrace attracts my attention. A gentleman comes in at the open casement. He looks at my card, which he holds in his fingers—looks at me—and then steps quickly forward. 'Sherwin?' he exclaims, seizing my hand. 'Why, you're the surgeon who saved my life! This is a pleasure.'

He is a man of about sixty, not strikingly tall, but with an appearance of unusual breadth and strength. Ten years appear to have wrought little change in him, certainly no change for the worse. It is the same handsome face, the same firm and fearless expression, that I now recall to mind as if it were only yesterday. He waves me towards an armchair near the window, brings me cigarettes, remembers my favourite iced drink, and in a word, makes me as welcome as if I were his own son.

He has been walking about the room, principally occupied in looking after my comforts, talking the while about matters of little, or at least no special importance. At last he lights a cigar and sinks down upon a tiger-skin on an ottoman facing me. He now, for the first time, speaks of himself.

'Did I ever tell you, Sherwin, how I came to receive that knock-down blow?'

'Why, no. I thought the whole affair inscrutable.'

'So I suspect it is,' he answers, 'as far as the world in general is concerned. But I can make it clear to you in a few words. Will you listen?'

I express myself most willing; and Colonel Hethersett begins. 'While stationed at Cawnpore, some thirteen years ago, I had a very unruly man-servant. The fellow was quite incorrigible. Most men would have sent him about his business within a week. In fact, every one had done so who had been unlucky enough to have him in their service. But I had a fancy to tame him. I could see that he thought himself my master. I resolved to prove to him the contrary, cost what it might.'

He speaks in a low, distinct voice that is very impressive. But his look is more impressive still. The intense gray eyes, the stern mouth, and contracted brow indicate the wilful, dauntless nature of the man.

'Most of us,' he resumes, 'choose the wrong vocation in life. I was a born lion-tamer. The fact is, Sherwin,' he adds, as though it were hardly worth mentioning, 'I don't know what fear means.'

He pauses for a while. I am on the point of making some inconsequent remark, when my ear is touched by the sound of music. It floats out airily upon the night, and seems to mingle harmoniously with the reflection of light that falls across the terrace from the windows adjoining the divan.

'One day,' Colonel Hethersett continues, 'one day, Kenrick, as this man was called, refused to obey me. It was the first time in my life that I had ever met with serious opposition. The look on the man's face told me that he felt he had gone

too far. But repentance had come too late. Had he instantly gone down on his knees and begged my pardon, it would still have been too late. My passion had got the better of me. I seized the first thing that came to hand. It was the most terrible weapon, I am sorry to say, that could possibly fall within an angry man's reach. It was a thong of buffalo hide. I struck him across the forehead—and he indicates the spot by quickly touching his own forehead while he speaks. 'He dropped at my feet as though he had been shot.'

I cannot utter a word. I hear no music now; no sound but loud throbbings in my ears. The Colonel rises hastily, and paces to and fro with a quick firm step.

I have risen too. I am standing at the window, and now glance eagerly out. The light thrown upon the terrace from this window and the windows of the adjacent room finds a limit against the terrace balustrade. Beyond, the darkness is intense; but in the midst of this darkness, on the distant high-road, pale-blue flames are lapping at a space in the night. It appears quite near—though it must be at least half a mile away—so near, that the soft wind, this sultry autumn evening, seems to contain its warmth as it touches my cheek.

The Colonel taps me gently on the shoulder and steps lightly out upon the terrace. I look quickly into his face. Every trace of severity is gone. 'Come,' says he, in a lively tone; 'let us go to the drawing-room. Sybil will be wondering who?'

'Stay!' I interrupt the Colonel—'one moment. This must be the man who struck you down—the man who made the attempt on your life in Smithfield—ten years ago.'

'Of course! How can you ask me?' He speaks with a slight impatience. But that does not check my questions.

'Have you seen him since?'

'No.'

'Nor suspect his whereabouts?'

'No.'

'Colonel Hethersett,' I resumed, 'I can tell you where he is. I have seen him, spoken to him, only this evening.'

'Where?'

I point across the terrace into the night. 'There! He is watchman at the limekiln fire.'

Not even now does Colonel Hethersett evince the least shade of surprise; nor does the weird light, that seems to me like a threatening torch lifted up in the black night by some invisible trembling arm, entice him to take his eyes off me.

'You knew him by the scar,' he quietly assumes.

'Yes; I knew him when you touched your forehead a moment ago,' I reply. 'It's a hideous mark.'

The Colonel looks troubled. 'Poor fellow! But I must tame him now,' he says with a sudden change in his face, 'or he'll spring at me again behind my back.'

'Do you really mean,' I say, in a tone of reproach, 'to take the law into your own hands?'

'I mean to tame him,' he replies in a firm voice.

His manner is polite, but so decisive that I make no attempt to utter another word. I stand there, and his eye is still upon me. I feel powerless in the presence of this strong-willed man. He flings away the end of his cigar and beckons me with a playful wave of the hand. I follow.

'Sybil, my dear,' I hear the Colonel saying, 'this is Philip Sherwin, the gentleman who saved my life.'

I am standing in a brilliantly-lighted drawing-room. A young girl in pale green attire is rising from the piano and is coming towards me. I cannot be mistaken. It is the lovely face that I had seen, only a few hours ago, mirrored in the midst of sunlight and foliage by the river-side.

PROGRESS IN CIVILISING THE INDIAN.

OLD Father Time rings many changes all over the civilised world, but in no portion are the changes as radical as in the Far West. Lately the writer made a visit among the same Indians—the Sioux—he used to visit thirteen or fourteen years since. But what a change he found! At that time the process of civilising these children of the plains was in its infancy; to-day, it may be said to have attained its youth. Then the Sun Dance, with its trying ordeals, was religiously observed every summer, and the youths who could successfully pass through the tortures without evincing fear or pain were admitted to full recognition by the entire tribe as warriors. But to-day, the Sun Dance, like the buffalo, has passed into tradition. The chiefs and warriors who at that time required an iron hand and the continual presence of troops to keep them in control, to-day are ranked as 'coffee-coolers,' who are cowed by a threat to reduce the rations Government furnishes them with. At that time the houses the Government had built for them were used to stable their favourite ponies in; and for the wagons, except in a few isolated instances, they had no earthly use; now, we find them occupying the houses themselves, except in extremely hot weather, and rarely do you see them on horseback.

The causes for these changes are many, but principally because the large game—buffalo, elk, and antelope—became so scarce that the Indians could not kill enough to sustain life. This made them dependent on the Government, for to work they were ashamed. Then the Government, to encourage them, discriminated in their favour in freighting—that is, in hauling the Government supplies from the nearest steamboat landing or railroad station to the Agency. At first you would see these Indian trains, as we called them, come over the hills and prairies lightly loaded, so as to enable the ponies, usually six in each team, to trot and run the entire distance. But as time passed on, and they observed that the white men employed in the same work earned more money, although they did not travel so fast, a change came. Naturally the Indian is shrewd, as we say out here 'smart,' and he was not long in detecting the reason for this difference in his earnings and the white man's. Then the red men who were willing to do this work—took the number was increasing all the time—took to horse-trading, and gradually displaced their

ponies for larger though slower horses ; with these they hauled heavier loads, even though they made slower time.

Do not for a moment imagine that these warriors, as they called themselves, took kindly to this work. In fact, all they did was to sit upon the wagon in dignified silence and drive the team. They carried their squaws with them to load and unload the supplies they hauled, as well as to harness and unharness the ponies, cook, procure fuel for camp-fire, and water. This was the first-step the Indian took towards civilisation. His next was to sit by and see his squaw farm, or maybe hold the reins while she held the plough handles. To-day the full-blooded bucks of middle age do little else. Only a few months since the writer saw an old fellow sitting in his wagon in grim silence beside his squaw, who had accompanied him about two hundred yards from their home for the purpose of filling the water-barrel at the spring. He was willing to drive the pony team, but drew the line at filling the water-barrel. According to his early training, that was work, and work was beneath the dignity of a great warrior ; in other words, he seemed to ask himself the question, what was the squaw intended for if not to work ? He had apparently, too, answered it to his own satisfaction, if not to the woman's.

You will say : ' We thought you were going to write of progress ; we don't see much progress in all this.'

Well, among the older Indians this is about as much progress as has been made, except in the matter of dress. For now you see every one dressed in civilised costume ; then, it was rarely you saw one except in savage attire—a breech-clout, leggings, and blanket. The progress has been made by the younger generation. The church missionaries took the youths and maidens in charge, and taught them the manners, customs, and morals of the whites. Nature had been kind to these dusky children in giving them such minds as might be moulded without great difficulty ; their perceptive faculties were keen, and their intelligence of a superior order to what it had been considered. Some of the youth of both sexes were sent to schools in the east ; but this was discovered to be injurious to their health, and many came back to the tribe with that dread disease, consumption, irretrievably fastened in their systems. Another result, too, was noticeable : that while the youth had been away at school learning civilised manners, the parents remained as they were ; and on the return of the youth, instead of influencing his or her parents for good, the Indian blood asserted itself, and the youthful ones soon returned to the old ways.

The greatest progress, and that most beneficial to the greatest number, was attained by the missionaries' efforts to teach the youth on their own reservations. This has at last become so apparent to the Government, that Industrial Schools are now being established near towns which have been built on the boundaries of the reservations, where the young Indians of both sexes will in future be taught industrial pursuits as well as the learning obtained from books. Nearly all the missionaries of the Episcopal Church to-day are native Indians, in some instances full-bloods, but for the most part half-breeds. These men are

earnest, conscientious, and industrious, exerting a powerful influence for good in the tribes.

To my knowledge, but one instance is on record where a young Indian has chosen and fitted himself for the practice of law. This happened in Dakota a few months since in the District Court of Brule County. His examiners reported him thoroughly competent for admission to the bar ; on which recommendation he was admitted, and is enjoying already a lucrative practice.

The latest move by the Government towards civilising these red men is an attempt to break up the tribal relations, and encourage them to take land in severalty, one hundred and sixty acres for each adult Indian, who, when he has chosen his land, is furnished with teams, agricultural implements, and is besides entitled to vote the same as any other citizen of the United States. Of these advantages, though, they are slow to avail themselves, because when they take this step all their rations are cut off, and they are expected to support themselves the same as any white man.

In one instance in particular the Indian sets an example to his white brother. In front of all their houses they erect a bowery, which affords a pleasant shade from the hot summer sun, and here they eat, instead of in the hothouse where the cooking has been done. Then, again, as soon as the fleas and other insects commence to bother in the summer, they take their blankets either into a lodge or tent, or else sleep in the open air. They say it is easier to move away from the insects than to move the insects.

The old full-bloods I don't believe can ever be civilised ; but the growing generation will become ere long comparatively so. Every generation will improve until, before many years, the Indian of to-day will be known only as a tradition.

IN GREEK WATERS.

I SAW a beacon lighted on a hill,
Rising from out the smooth Ionian Sea ;
Soon it took shape and spread itself, until
Another light it showed itself to be—
The rising moon. It was no light of earth :
This island-beacon owned a heavenly birth.

I saw the sun rise straight out of the sea,
Gilding green Scio's isle with newborn light,
Till all before me, mountain, tower, and tree,
Was crowned with glory. 'Twas a goodly sight.
Its fair remembrance shall abide with me,
When on this drooping soul falls the dull night.

We passed Colonna's Cape, where Sunium stands,
With its white temple warning us away ;
Bidding us back with deprecating hands,
Lest on th' enchanted ground we rashly stay.
Like ghosts they hover o'er the perilous steep,
As those who have received a charge to keep,
To keep the mariner lest he go astray ;
Not as those Sirens luring to the shore,
Thy columns, Sunium, haunt us evermore.

THE SCILLY ISLES.

It is not a particularly far cry from Fleet Street to the Scilly Isles, and yet I suppose more Englishmen know the shores of the Mediterranean and the ways of life in the American West than aught by experience of this little archipelago, some twenty-five miles west-by-south of Land's End. In a measure, this is not wonderful. For the Scillies are so small a group that one may almost be in doubt if they contain adequate moving-room. And further, they are neither extremely grand in their rock scenery, nor do they offer those chances of sport in different branches which are generally the chief attraction in outlying lands.

All the same, they are worth visiting, if only for the fine lesson they give in the brutality of the sea and the storms. A stroll round their various coast-lines is quite alarming. There is so much ponderous wreckage lying about the granite boulders and edges, that it seems as if every night in the year brings local disaster upon some poor vessel. This is not really so, of course. But before the existence of the three or four lighthouses which now guard the isles, the Scillies were about the worst group of rocks in our seas for their fatality. Sir Cloudesley Shovel and the greater part of his fleet came to grief upon them; and many a hundred other vessels. In those days, too, the islanders were a disreputable set of fellows. It was only natural. They caught fish in their waters, to be sure; but they also relied upon smuggling and the more solid fruits of the sea. Tradition tells us that on St Agnes, the fourth island in size, it was customary for the men to meet once a year at a certain well in a rocky cove, and ardently invoke their patron saint to send them plenty of wrecks in the coming twelve months.

Nowadays, however, the islands are somewhat paternally administered. They are part of the Duchy of Cornwall; but some sixty years ago were leased to a gentleman named Augustus Smith; and his nephew, the present proprietor,

still holds them in continuance of this lease. The Smith rule is, upon the whole, very good for the islanders. The Governor, as he is called, is especially opposed to the old error of overpopulation, which made life for the Scillonians wretched and precarious. On the other hand, to better the lot of those remaining, industrial works of a small kind were instituted. The pier of St Mary's is one of these works. The early-potato traffic and the cultivation of flowers have also of late years enabled the islanders to put much money in their pockets.

Under these various civilising influences, the Scillonians have become a reputable little community. Instead of rejoicing over a shipwreck now, they are at all times eager to risk their own lives for the lives of others, and full of pity for the poor fellows the storms leave upon their rocks naked and destitute. They have three admirable lighthouses in their waters—on Round Island, St Agnes, and the Bishop Rock; and also a lightship stationed several miles to the east of the archipelago. And annually they are called upon to put themselves to no slight inconvenience and expense in burying the bodies of the unfortunates whom the sea washes upon their shores. They do not like this sort of thing, to be sure. It seems hard that there should be no State fund for such a purpose. Nevertheless, they bear their burden without an excessive amount of grumbling.

The islands are so low in the Atlantic that they are more numerous when the tide is out than when it is at the flood. It were a long business to record their names. It is enough to mention the principal isles: St Mary's, Tresco, St Martin's, St Agnes, and Bryher. These are the only islands now inhabited: and, all told, their population is under two thousand. Until about 1855, a sixth island, Samson, held a few families—numbering thirty-seven souls in 1831—but the census of 1861 found nothing but dismantled buildings among the gorse and heath of this picturesque little plot of land. These shells of houses still exist, and serve as stalls for the eight

or ten cows that are now the successors of their residents.

St Mary's, the chief island, is about nine miles in circumference, and in no part of it does it rise as high as a couple of hundred feet. Considering its smallness and remoteness, it is by no means a dull little land. This is markedly shown in the spring, when the mackerel season has begun and the flower season is not yet over. Daily then, during the workaday week, a steamer leaves the capital for Penzance, and often it takes a sufficiently valuable freight to Billingsgate and Covent Garden.

From my bedroom window in the hotel of St Mary's I used to watch the long procession of luggers running into harbour soon after day-break, to get their catches sold and stored for the morning market. Sometimes three or four would speed abreast up the sound; and now and again, when the wind was strong from the north, with a low barometer, their pitching and tossing was enough to make me think the hotel itself had lost its equilibrium: a delusion fostered by the wailing of the wind through the crevices of the house, and the agitated fronds of the Himalaya palms in the garden outside. The scene on board the steamer of a morning was also odd enough to be worth witnessing. As each lugger came alongside and exposed its catch in its hold, the fish auctioneer put them up for sale without loss of a moment. If they were mackerel, they were sold by the hundred; if hake, by the dozen or score; or singly if they were fine fish and few were in the market. It was soon settled. The Billingsgate men on board paid cash down, and immediately had their spoil packed and stowed. In less than twenty-four hours it would be in the savoury market by Thames' side: not literally 'all alive oh!' but fresh enough to suit even a fastidious palate.

The flowers are a much sweeter subject. Scilly land-cultivators are vastly indebted to the Governor, Colonel Smith Dorrien-Smith, for this island industry. He himself sends tons of narcissus to Covent Garden from his residential island of Tresco, a mile across the strait from St Mary's. But the expenses of his gardens and estate are so large that the flowers are hardly a source of revenue to him. Not so with other Scillonians. You may see acres of the flowers in the more sheltered parts of St Mary's protected from the gales by high fencing and hedges of the shrub *Escallonia macrantha*; and acres mean a good deal when the wholesale price of an undamaged single narcissus is a farthing. It is not an uncommon thing for a farmer to send off fifty pounds' worth of the flowers in a week; this, too, without reliance upon any hired labour. Nor is the flower-season so short and uncertain as one might suppose. It runs through April and May with little or no variation. And afterwards the potatoes have to be dugged and packed in like manner, with the like agreeable result to the cash-box of the farmer. If the Scillies were not overmatched by the competition of the counties in the south-west of the mainland, they would also send us clotted cream as good as Devon's; but they do well without this. There are three or four banks in the little capital of the archipelago, which tells a tale of its own. But in spite of this, not every cultivator will

trust his 'pile' out of Penzance. Some think there is likelihood of the south of France ousting Scilly in the flower-trade even as it has to some extent in the new-potato trade. But it seems improbable; for French express trains cannot compete quite satisfactorily with the trains from Penzance; and with such delicate merchandise every hour is of consequence.

The climate of the Scillies is so mild that, in common with a score or two of other island groups, the archipelago figures as a health-resort. If only St Mary's was a little larger and could afford to print a newspaper of its own, we should hear more on this subject than we do. As it is, the Penzance press does its best, and in the Cornish bookshops one espies pamphlets which, upon perusal, prove plainly that with such salubrious islets within three or four hours' steam of the mainland, people who go to Madeira and Tenerife are sometimes more than foolish.

But, in fact, though the Scilly air is sufficiently pure, the Scilly climate is really neither dry nor steadily warm enough to compare favourably with the better-known invalid resorts. The islands get snow in seasons like the winter of 1890-91; and they are always subject to the same variability that gives such a charm to our British climate. During one week in May, we had, for example, a tearing breeze from the south-east, rain-squalls from the south-west, a nipping north-wester with clear skies and a bright-blue sea studded with dancing white-horses, and a sober calm which made the myriad of Scilly's black rocks look like bits of coal spread about an immense polished silver dish. It was a wonder we had not a fog as well. These are, in truth, the most characteristic visitations. It is during the fogs that most of the wrecks take place; and they come so thick in the spring that the doomed ship may get within gunshot of the lighthouses without seeing the lanterns. As it was, one or two of the nights were misty enough to set the doleful fog-guns of the Bishop lighthouse firing in the dark hours.

Though harmless to the robust, if bestowed in moderation, these Scilly fogs can in no way be recommended to the invalid. Moreover, they are such gloomy blankets for the person whose mind or body is not at ease. Nor are there in this little coterie of houses those welcome diversions which in the sunnier south help forward the well-being of the body by the entertainment of the mind. To hear tell of a fishing lugger ashore on the Retarrier Reef or Annet, with the probability of all hands being lost, is the strongest excitement one may then look for. And on the morrow you may go and gaze at the crushed frame of the vessel through your telescope if you think the sight will do you good. With most of us, however, these tales of calamity are bound to have a depressing effect.

Next to St Mary's the island of Tresco is the most important. It is scarcely half the size of St Mary's, yet at the beginning of the century its population equalled that of the chief island. However, in 1881 it had but 328 inhabitants as compared with the 1290 of St Mary's; and the current census will not much disturb this proportion.

As the abode of the lord proprietor of the isles, Tresco is in some respects more interesting

than St Mary's. Smith the First—if we may be allowed the phrase—designed and built the Abbey residence here close to the ruins of an old monastic establishment which is believed to date from the time of the Norman Conquest. The visitor who fails to cross the couple of miles of waterway between St Mary's and Tresco to visit the Smith gardens is held to have missed the most alluring spot in the isles. It may be so. Often, however, the passage involves a hearty attack of sea-sickness, which some think not worth risking even for the sake of the most illustrious spectacle in the world. Yet, seriously, the Tresco gardens are in their way very charming. The congregation of sub-tropical plants in this sheltered recess is particularly remarkable; and it is certainly odd to walk in an avenue of palms, hale and hearty as can be, and be able to assure one's self that England is only five-and-twenty miles away. This, I suppose, is one of the surest proofs of the mildness of the Scilly climate.

But the Abbey is not all Tresco by any means. At the northern end of the island the rocks are as bold and impressive as their altitude will allow them to be; and here, too, on the edge of the strait which parts Tresco from Bryher, is a solid old castle keep which has been christened after Oliver Cromwell. There is, further, a cliff in the channel a stone's-throw distant which goes by the name of Hangman's Rock, and tradition has it that during the Great Rebellion the rock was used as a place of execution. After the general flavour of tragic death by drowning, which heretofore has seemed the main feature of the Scilly Isles, it is almost exhilarating to meet with such fresh suggestiveness as this.

Of the other inhabited isles little need be said. Bryher is sometimes left by the spring-tides accessible on foot from Tresco. It has a winding coast-line, with bright little bays verdant to the edges. St Agnes is set about with ghastly rocks like teeth, that even in calm weather look as if they were hungering to transfix the bottom of an ironclad. Here more bodies are washed ashore than upon any of the islands, much to the annoyance of the people; and in its frightful bays you may see the shattered framework of more wrecks than elsewhere. The modern dwellers in St Agnes are not reprobates like their forefathers; the lighthouse set in their midst is rather a type of their regenerated natures. In 1881 they numbered but one hundred and forty-eight—every one, I imagine, cousin, if nothing nearer, to his neighbour. It is said you may still reckon off their distinctive surnames on one hand.

Last of all, St Martin's must be noticed. This is the third in size, and the one of which I have the most pleasant recollections. I was first attracted to it by the glowing gold of its gorse as seen from Tresco, a mile or two distant. Later, I stayed in it for a while, being welcomed into the family of an honest farmer whose ancestors had dwelt here I know not how long. As its extent is only about five hundred acres, I was soon much at home with its yellow downs and snowy sands; and when the time came to commission six of the islanders to row me back again to the capital, I was as sorry as if I had had to snap a chord in my heart. It has not very much individuality. Yet on the map you may see

that its various centres of population are called Higher Town, Lower Town, and Middle Town. Is not this delightfully ambitious in an island of five hundred acres, with, all told, a hundred and seventy souls, and not a single house for the sale of tobacco or strong drink? Yet there is nothing of braggartness about the people themselves. Those of them who do not subsist by the cultivation of their little garden-plots possess liver-coloured cows, and rely upon the Atlantic to enable them to keep soul and body comfortably conjoined.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXIV.—THE HALL OF THE NEW FAITH.

THE Place, as Mr Edmund Gray modestly called it, was a meek and unpretending Structure. The word is used advisedly, because no one could call it anything else. Not an Edifice: not a Building—a Structure. It turned its gabled front to the street, with a door below and a window above. It was of gray brick with a slate roof—a very plain and simple Structure. It might have been a Primitive Methodist Chapel—this Connection are fond of such neat and unpretending places: or a room belonging to the Salvation Army: or one of those queer lecture halls affected by Secularists and generally called the Hall of Science. On the door-post was affixed a small handbill, announcing that every Sunday evening at seven o'clock an address would be pronounced by Edmund Gray, on the subject of 'Property.' On the same bill, below the line of the principal title, were suggestive subtitles. Thus:

- 'Property and its Origin.'
- 'Property and its Evils.'
- 'Property and its Dangers.'
- 'Property and Liberty.'
- 'Property and Progress.'
- 'Property and its Decay.'

The Master pointed to the Bill. 'Read it,' he said. 'There you have my mission clearly announced. No mistake about it. A bold pronouncement, which cannot be mistaken. I make war against Property—I am the enemy irreconcilable—the enemy to the death—of Property. I am almost alone against the world, for my followers are a feeble folk and without power. All the interests, all the prejudices, all the powers, all the intellect, of the whole world are against me. I stand alone. But I fear nothing, because the future is given over to me and to mine—yea—though I do not live to see the day of Victory.'

He opened the door, and Elsie entered. She found herself in a room about sixty feet long by twenty broad, and lofty—a fine and goodly room. It was furnished with a long and narrow table running down the middle, and a few benches. Nothing else. The table was laid with a white cloth, and provided with plates of ham and beef, cold sausages, hard-boiled eggs, cakes, toast, muffins, bread and butter, marmalade, jam, shrimps, water-cresses, and teacups. In fact,

* Copyright 1892 in the United States of America by Harper & Brothers.

there was spread out a Tea of generous proportions.

The room was half filled with thirty or forty people, mostly young, though there were some elderly men. Among them Elsie remarked, without surprise, the decayed Barrister of Gray's Inn. Perhaps he was attracted as much by the loaves as by the sermon. Three-quarters of them were young men. Elsie noticed that they were young men of a curious type—their faces keen, their eyes hard, their manner aggressive. They belonged to a Church Militant. They longed to be fighting. On the appearance of their preacher they flocked about him, shaking hands and inquiring after his health. At least, therefore, he had the affection of his followers.

'My friends,' said the Prophet, 'I bring you a new Disciple. She comes to us from the very stronghold of Property. Her friends'—yet he had shown no sign of recognition—'are either those who pillage the producer, or those who rob the possessor on pretence of defending him. She is at present only a recruit. She comes to listen and to learn. She will go home to remember and to meditate. She is a recruit now who will be hereafter a Leader.'

The people received her with curiosity. They were not of the higher classes, to put it mildly, and they had never had a young lady among them before. Two or three girls who were present—girls from the dressmakers' workrooms—looked at her frock with envy, and at her bonnet and her gloves with a yearning, helpless, heart-sinking admiration. To the young men she seemed a goddess, unapproachable. They stood at a distance: men of the rank above them would have worshipped. These young men only gaped. Such a girl had nothing to do with their lives.

Apparently they had been waiting for the Master, for at the moment a stout woman and a girl appeared bearing trays with teapots and jugs of hot water, which they placed upon the board. Mr Edmund Gray took the chair. Elsie began to feel like Alice in Wonderland. She came to see a 'Place': she expected to hear a sermon or a lecture: and behold a Tea!

'Sit beside me,' said the Master. 'We begin our evening on Sunday with a simple feast, which I provide. It is a sign of brotherhood. Every Sunday we begin with this renewal of fraternity. Those who break bread together are brothers and sisters. In the good time to come every meal shall be in common, and every evening meal shall be a Feast. Eat and drink with us, my daughter. So you will understand that you belong to a Brotherhood.'

'Try some srimps, Miss,' said her neighbour on the right, an elderly man, who was a builder's foreman.

History does not concern itself with what Elsie took. She found the meal very much to the purpose after a long afternoon of talk, argument, and emotion. She was young and she was hungry. The tea was good: the things to eat were good: the cake and toast were admirable. Elsie ate and drank and wondered what was coming next.

After a little, she began to look round her and to watch the company. There were now, she counted, forty-five of them—forty-five disciples of

Mr Edmund Gray. What had he to teach them? The destruction of Property. Out of the four millions of London, forty-five were found who wanted to destroy Property—only forty-five. But perhaps all who advocated that step were not present. Her ancient prejudices whispered that this was a reassuring fact, considering that the Preacher had preached his doctrines for nine long years. Only forty-five. Next to her the foreman began to talk to her of Fourier and Owen and a dozen half-forgotten leaders in the old experiments. He had been a Chartist in the Forties: he was a Socialist in these, the Nineties: but he confessed that before any real reform was attempted, Property must first be destroyed.

'It's the selfishness,' he whispered earnestly, 'that's got to be torn out by the roots. Take that away, and there's a chance for the world. It never can be taken away till a man finds that he can't work no longer for himself, and that he must work for all, whether he likes it or lumps it. Don't give him the choice nor the chance, I say. Take away Property, and there's neither choice nor chance left. You hear Mr Gray upon that. Oh, he's powerful! What do they say? Naked we came into the world. Naked we enter into the Kingdom of Heaven. There's a wonderful lot of fine things hangin' to that. You must wait till you hear Mr Gray upon that theme.—Kingdom of Heaven! To hear the parsons talk, it's away above the clouds. Not so. It's here—close beside us—on this earth. All we've got to do is to put out our hands and reach it.'

'You may put out your hands as much as you like,' said one of the younger men; 'but you won't reach it, all the same. Property stands between.'

'At our place,' said a girl sitting opposite—a girl of intelligent face, pale and thin—'we work from eight till eight, and sometimes longer, for twelve shillings a week. I know what things cost and what they sell for. I could produce enough to keep me—ah! a good deal better than I live now—if I could sell what I made myself—for four hours' work a day. So I work eight hours a day, not counting the dinner-hour, just to keep the boss and to make Property for him. My Property it is—well—I know—in here, we say, *our* Property: outside we say, *my* Property. Where's your Kingdom of Heaven, then, if you reach out your hand ever so far, so long as I've got to work to make somebody else rich? Let's destroy Property, and then we shall see.'

A desire—a foolish concealed desire, born of prejudice, seized Elsie to argue. For she perceived in the girl's reasoning certain confusions and intricacies. But she had the courage to suppress the inclination: she refrained. She was a disciple. She must listen.

'I am a slave, like all the rest of us,' another young man remarked, cheerfully. 'My Master owns me. He can sell me if he likes, only he calls it by another name: he can't take a whip and lash me, though he'd like to; because, if he did, I'd break every bone in his body for him, but he can cut down the work and the money. I do editing and reporting for a local paper. Thirty shillings a week. The proprietor makes ten pounds a week out of it. And I'm not allowed to tell the truth for fear of advertisers.' He added a few words not commonly

heard in a place that looked like a chapel on a Sunday evening.

Elsie observed that their faces showed two variations of expression—only two. The majority of the company had the eyes of the dreamer, the theorist, the enthusiast. They are soft eyes, and in repose are heavy, and they look through stone walls into space, far away—space where their dreams are realised and men and women live according to their theories. In moments of enthusiasm and passion they become flaming fires. These eyes belonged to most of those present. The rest—the minority—were those who are angry and restless and eager for the practical application of the doctrine. These want revolution: they are impatient: they feel for themselves the injustices and oppressions which enthusiasts feel for others: these are always resentful: the others are always hopeful: these want to convert the world at once with bludgeon and with gun: the others are certain that before long the world will be converted by reason. The one despairs of anything but force: the other will have no force: the one hates his enemy: he would kill him if he could: he has no words too bad for him: the enthusiast, on the other hand, regards his enemy with pity, and would at any moment welcome him, forgive him, and—well—invite him to a Fraternal Tea if he would only desert his ranks and come over. And these are the two divisions in every party, and such is the nature of man that there must always be these two divisions.

The Fraternal Tea finished, the company cleared the tables, everybody lending a hand, perhaps as another sign or pledge of fraternity. It was then nearly seven o'clock, the hour appointed for the address. The door was thrown wide open for the admission of the world; but there was no sign that the world took the least interest in the subject of Property. No one came at all. Elsie learned afterwards that the world outside the Hall had long since grown tired of the subject on which Mr Gray had been preaching for nine years. Those who came to the Tea were the inner circle of believers or disciples, a small but faithful company, to whose members there was rarely any addition.

At seven Mr Edmund Gray rose to commence his address, standing at the head of the table, so that it was like an after-dinner speech. Outside, the sun was hot and bright and the air clear. Within the Hall, there were the mingled odours and steams of long-protracted and hearty Fraternal Tea: the air was heavy and the room dark. When the Master began to speak, a young man—one of the ardent and wrathful kind—drew out a note-book and took everything down: all listened with respect, some with rapt interest. Some nodded—some groaned—some said 'Hear' softly—to encourage the preacher and to show their adhesion to principle.

Elsie sat at the right hand of the speaker. His discourses moved her much less in this public place than in his chambers. The persuasive voice was there, but it did not persuade her—moreover, she could not meet his eyes. Their magnetism failed to touch her. So much the better, because she could listen with cold judgment and watch the people.

'My friends,' he began, 'my brothers and my

sisters—we are all long since agreed that the root of all evil, the first form of disease, the first fatal step that was leading to so many other mischiefs, was the beginning of Property. We have proved that so often—we are all so entirely agreed upon this vital principle, that we seldom, and only on rare occasions, find it necessary to do more than assume its truth. That occasion, however, is the present, when we have among us one who comes as a stranger, yet a disciple: one who has a mind open to the influence of reason: one who is anxious to clear herself of the prejudices and absurdities in which she has been from infancy brought up. Let us, therefore, briefly, for her instruction and for the strengthening of our own faith, point out some of the arguments which support this position. It is to us an axiom. To the world it still requires proof. And the world refuses to accept the proof, because it is given over to the Chase of the Abominable Thing.'

He proceeded to parade the reasons which made his School regard Property as the root of all evil. The line which he pursued was not new: many men have pointed out before Mr Edmund Gray the selfishness of mankind as illustrated by the universal game of Grab: others, with equal force, have shown that the protection of Things causes an immense expenditure and a great shrinkage in Things: others have shown that it is the continual efforts of men to get without working the Things for which others have worked, that fill our jails and keep up an army of police.

'We start with a false principle,' the Master went on, 'which has ruined the world and still keeps it down. If there are to be rich men, they must become rich at the expense of the rest: they must be few, and the poor must be many. Therefore, the protection of Property is the robbery of the poor by law. We all know that: in this place we have agreed, so far, a thousand times: the rich can only become rich by robbing the poor: they rob their land: they rob their work: they rob their whole lives—and they are permitted and encouraged by the Law. Shall we, then, change the Law? No: it would be a work too vast. Shall we change the minds of men? Not by reason: it is impossible by any argument so long as by law and custom they can still rob the producer of his work. The only way is to destroy all Property. When men can no longer by any kind of thought get richer than their neighbours, then they will cease to think for themselves, and think for the whole community. You will say—some one may object—that some are not the same in strength of mind or of body: there will be many, then, who will refuse to work at all, and become burdens on the community. We have thought of that objection. At first, there would be many such; but not for long. Because we should kill them. Yes, my friends,' he added with a smile of the sweetest benevolence. 'For the good of the community it will be necessary, without any sentimental considerations, to kill all those who refuse to work, all those who shirk their work, all those who persistently do scamped and bad work. They must die. So the commonwealth shall contain none but those who are vigorous, loyal, and true. For the rest—Death—if it means the death of a million who were once

rich—Death is the only escape from the difficulty which is so often objected.

'It has been asked again how we differ from the Socialists. In this. We would begin with no theories, no constitution, no code. Only let every man give all his strength, all his heart, all his mind, to the good of the commonwealth, without the least power of enriching himself, saving money—of course there would be no money—without the chance of getting better food and better clothes than the rest—and we may safely leave the world to take care of itself. Why—my brothers—why—my sisters—should we poor purblind creatures, unable to comprehend more than a glimpse of that glorious future which awaits the world when Property shall be destroyed—why—I say—should we dare to lay down schemes and invent systems for that glorified humanity? Let us leave them to themselves. They will be as far above us, my brothers, as we are already above the holders and the defenders of Property.'

Elsie looked at the little gathering—five-and-forty—with a little smile. They were then already far above the holders and the defenders of Property, and again she thought, 'What if these words were heard in Lincoln's Inn?'

'How, then, can Property be destroyed?'

At this practical question every one sat upright, coughed, and looked interested. Their Preacher had often enough declaimed upon the evils of Property. He seldom spoke of a practical way. Perhaps the time had come.

'There are, my friends, several ways. They are already beginning to be understood and to be worked. The Irish and the politicians who wanted the Irish vote have shown the world how to destroy property in land. Believe me, that example will be followed. It was an evil day for the holders of Property when the Government interfered between the landlord and his tenant. That example will bear fruit elsewhere. We shall see everywhere the owners of the land turned out and their places taken by those who work the land. The next step is from land to houses. Why not with houses as with land? Since a beginning has been made, it must be carried on. But there is other property besides lands and houses. There are companies with shares, railways, and so forth. We have only begun to see what united labour can effect—since union of labour is, in fact, not yet begun. When it is fairly started, it will pay small respect to shareholders and to dividends. When wages are paid, there will be perhaps no dividend left at all. In a single year—nay, a single week—the whole capital invested in all the companies will lose its value: it will be so much waste-paper. My friends, we need not stir hand or foot to bring about this end: it will be done for us by the working-man, and by those who follow the example of Ireland. They will do it for their own selfish ends first—but—Property once destroyed, we shall never again allow it to be created.

'Oh!'—he warmed with his subject, his voice grew more musical, his face glowed—'I see a splendid—a noble sight. I see the great houses in the country fallen to ruin and decay: their contents are stored in museums: the great palaces of the towns are pulled down: the towns themselves are decayed and shrunk: there

is no Property: there is no one working for himself: the man of science works his laboratory for the community—but he has the honour of his discoveries: the medical man pursues his work with no thought of getting rich: there is plenty to go the round of everything—oh! plenty of the best. We can have what we like, do what we like, dress as we like, teach what we please—provided we work for the State. If we refuse—Death! If we give bad work—Death! It is the only Law. We shall have no lawyers—no power—no magistrates. Oh! great and glorious time—you shall see it, you who are young—yes, you shall see it—while I—I—I—who have dreamed of the time so long—I shall lie low in the grave. What matter—so the time come and so the world rises free at last to follow out the destiny of a new and glorified humanity!'

He sat down and laid his head upon his hand, as one in prayer. They remained in silence till he raised his head. Then the young man who had called attention to his slavery spoke.

'There is perhaps another way,' he said, 'which might do the job for us. Suppose the chemists were to find out how to produce food—food of any kind—artificially—just as good and as nourishing as if it was butcher-meat or bread. Suppose it could be produced dirt cheap—most chemists' things cost nothing. Then no one would need to work: because he'd have his food found for him. If no one would need to work, no one could get rich any more. And if no one wanted to buy anything, nobody could sell. Then riches wouldn't count, and there you are. Let's get a chemist to take the thing up.'

The conversation that followed struck out new ideas. Presently it flagged, and one by one the people stole away.

The Master and the Disciple returned in the tram as far as Gray's Inn.

The Master fell into profound silence a quarter of an hour before the end of the journey. When they got down, Elsie observed, first, that he buttoned his coat; next, that he put on gloves; thirdly, that he pulled his hat forwards; and lastly, that he ignored her presence. He drew himself erect, and walked away with firm and precise step in the direction of Bedford Row, which is on the other side of Gray's Inn. He was once more Mr Edward Dering.

'I wonder,' said Elsie, 'how much, to-morrow, he will recollect?'

(To be continued.)

THE VOLE PLAGUE IN SOUTHERN SCOTLAND.

THE widely-circulated statements in the daily newspapers, together with reports therein of meetings of the panic-stricken owners of flocks, special Reports from Commissioners sent out from the new Ministry of Agriculture, as well as discussions that have taken place in the House of Commons, seem to have at last awakened the general public to the seriousness of the veritable calamity that has overtaken the sheep-farmers along a wide district not very far from the Scottish Borders. Although a plague of mice is no new experience in that land of old romance, where dales and glens alternate with the great rounded green hills which form the Southern

Uplands of Scotland, yet the little animals whose voracity has caused so much destruction to the food of the 'woolly people,' and consternation in the breasts of their owners, are probably on this occasion spread over a wider stretch of the southern Scottish counties, and more numerous everywhere on the affected lands than on any previous occasion. The little rodent whose ravages in the aggregate are so calamitous is one whose history is full of similar destructive outbreaks both in Britain and in various other northern countries. In some parts of the Continent these great recurring phenomena of 'over-population' in the mice communities are regular landmarks in local chronology, and the peasantry long refer to them as the 'Mice years'; just as in other parts similar outbursts of other members of the same destructive family of small quadrupeds are remembered as 'Hamster years' or as 'Lemming years.'

It is a pity that the term 'mice' has ever been applied to these little vermin, for in the matter of natural history definiteness and correctness of nomenclature are of first importance. In reality, foxes, jackals, and wolves might with greater nearness to truth be termed 'dogs,' than the Voles that have increased in their myriads to cause the present plague can be named 'mice.' There are three British species of voles—the Water Vole, more generally known by a similar misapplication of terms as the 'water rat'; the Red Bank Vole, which in some slight degree in at least a few localities shares the reputation for destructive powers so universally assigned to our third species, the Short-tailed Field Vole. The last named is very generally distributed throughout the mainland of Great Britain, and in the Islands extends to the most of the Inner and Outer Hebrides and to the Orkneys, but has not, we believe, been detected in Shetland. Very curiously, neither this vole nor either of the other two voles is found in Ireland.

The short-tailed field vole is a very pretty little animal notwithstanding its short aspect and somewhat chubby cheeks, and although no great climber and a very poor jumper is wonderfully 'smart on its feet.' It gets along its 'runs,' and across the pathways and sheep-tracks in the course of its foraging expeditions like the figurative flash of lightning; and the surprise of people who make its acquaintance for the first time and note its celerity of movement is very amusing. The present writer remembers with delight a pleasing 'interview' he had with a party of these voles some years ago on the brow of one of the hills in Upper Nithsdale. He had been along the hill-tops after white hares, and it was getting pretty far on in the afternoon of a sunny winter day when he sat down in a nook fully exposed to the sunshine to await his companions. Presently a vole appeared two or three yards away sitting up on its hindlegs, trimming its whiskers and the fur of its face with its forepaws. Then another and another appeared, till nine individuals were playing about the grass and heather, apparently in full enjoyment of the heat of the evening sun-rays. Sometimes a blade of grass would be taken up and nibbled for a few seconds, the little jaws vibrating with great rapidity in the act of chewing; now and then one would chase another for a short distance, evi-

dently more in play than anger, and pursuer and pursued would emit a slight sound more like a chirp than a squeak. The pretty scene had lasted for nearly half an hour, no other vole than this family party of nine appearing, when an unlucky movement on the part of the watching biped scared the merry little quadrupeds, who instantly disappeared with a scamper into their runs, holding their little short stumps of tails straight out behind in a decidedly comical manner.

Not alone in the sheep-farm country are the voles to be found. In the rough grass in young plantations, in the thick tussocks of grass in meadow and bog land, and wherever grass has not been grazed too closely, or where it has lain free of tillage for a year or two, will these little beasts be found in plenty. Their runs are on the ground just above the grass roots, and cross and recross each other, interlacing in the most intricate fashion. Some time in March, earlier or later according as the weather favours the operation or otherwise, their household cares begin. A hollow on the surface of the ground is chosen, and if shelter can be obtained between two or more tufts of grass, so much the better. A long oval habitation is constructed, the walls being built of small pieces of dry grass or other fine vegetable fibres closely woven and felted together. If the moisture does not soak into this nest from beneath, it certainly cannot enter it from above, for the way in which it is thatched will throw off the most violent rain-storms. An entrance is made underneath one end, and inside this snug and cosy cradle the young are deposited to the average number of five or six; but we have on occasions found as many as ten. These nests are eagerly sought for by rooks, and when found, torn to pieces at once; the young mice being greedily gulped down by the black bogies, whose appearance must be the prevailing terror of voledom.

These voles are possibly seldom thought of as domestic pets, but we can assure our readers, from an experience gained in other and more youthful years, that they make most interesting little pets. They have none of the objectionable odour which the keepers of fancy mice so vainly endeavour to get rid of, and for wild animals they soon acquire an amount of confidence and tameness that is most surprising. They will eat in captivity almost any kind of vegetation; or, as the phrase goes in Dumfriesshire, they will devour 'any green hait (atom)'; but little blades of tender green grass are their favourite nibble, and they will soon learn to take it from one's fingers. Scampering up and down their cage, sitting up on their haunches, while they make use of their forefeet as hands to hold up blades of grass or other food while eating; grunting and squeaking in a low subdued key, just like miniature Guinea-pigs—to the Abyssinian variety of which, so much prized by fanciers, they indeed bear a remarkable resemblance—they are amongst the most entertaining of small pets.

These details of the family life of the short-tailed vole are not likely to be very acceptable to the sufferers from their ravages in Southern Scotland, who have every reason to foster a bitter hatred of the whole race. The evil the voles have done, are doing, and will yet do, is so

enormous that no one can blame the farmer who cherishes an utter detestation of the evil multitudes that have wrought so much havoc in his pastures, and caused so much loss to his pocket. The complete destruction that has come upon the sheep-farmers must be seen to be believed; no description can convey any adequate idea of the damage done. From the west of Roxburgh right along the great range of hill-farms between Dumfriesshire on the one side, and Selkirk, Peebles, and Lanark on the other, away on to the head of Nithsdale and the northern portions of the Stewartry of Kirkcudbright, there is an all-pervading plague of voles. On every farm in this long range the damage has been of the most serious character; on some every blade of grass, and even the weeds, have disappeared, leaving the land literally bare and red. The total area affected to a destructive extent cannot be much short of 160,000 acres.

For some years past the voles have been noticed to be steadily on the increase; but it was not till the favourable breeding seasons of 1889, '90, '91 that it was seen that this increase had rapidly developed into a plague. In ordinary course, when the voles have to contend against the vicissitudes of the weather, and their usual natural enemies, such as disease, hunger, rooks, and birds and animals of prey, they are easily kept in check, and they do not breed—according to accurate observers—more than three or four times in the year, and the usual litter does not number more than six. But when an extra dry warm time occurs on the hills in spring and early summer, the grass on the moist sheep-farms springs up in great luxuriance, and the voles have dry shelter, abundance of food at the critical period of breeding operations, and the consequent robust health and freedom from molestation by their furred and feathered enemies, induce them to propagate so fast that litters increase sometimes to as many as ten, and at intervals of about four weeks, for seven or eight months in succession, the young ones themselves meanwhile beginning to breed at the age of nine or ten weeks. The case now becomes one of rapid geometric progression in figures, so that the sudden appearance of vast hordes of mice on lands where shortly before few were to be seen is easily accounted for. That they migrate for short distances is undoubted, for numerous instances of this are continually turning up on the infected farms at present; but that there will be any general migration to the arable lands, as is so greatly and generally feared just now, is most unlikely. Even if the voles did so, they would be much more easily coped with amongst the clods and furrows than in their native fastnesses.

So far as the plague has gone no simple and effective mode of coping with the vermin has yet been found, or at least adopted. Raids by men with sticks and spades and accompanied by dogs were organised on a large scale before the lambing season began, and the voles were killed in an exceedingly wholesale manner; but so numerous are their myriads that notwithstanding the large numbers killed, no appreciable diminution is noted. In some of the outbreaks in Germany, poisoned grain shot into the underground runs by means of a description of spring-gun was found to be very effective, multitudes being easily

poisoned. The objections to the use of poisoned grains in this country are many and weighty, even if the use of it was to be sanctioned by the legislature. Some hundredweights of poisoned pills of meal were however prepared by a well-known firm of Edinburgh chemists, and these were distributed over a sheep-farm in the neighbourhood of Moffat. But the voles turned up their noses at the pellets, and would have nothing at all to do with the deceitful food. In the Crown Forest districts of England, where these little rodents are often troublesome, rows of small pits with bottoms wider than the tops are dug, and into these the mice topple when on their rambles, and their athletic powers not being much developed, they cannot get out again, and are thus easily got at and destroyed. These pits are by far the most effective and cheapest traps, yet it is rather singular the Scottish farmers have refused to try them on anything like a systematic and extensive scale. To be sure, this mode has been tried somewhat partially and rather experimentally in some parts; but the farmers declare that most of their land slopes so steeply, or is so hard or so wet on the flat portions, that the pit plan is impracticable. Sinking zinc buckets till their upper rims are level with the surface of the soil has been found to entrap large numbers, but the great expense involved precludes this plan from being generally adopted. Wide-mouthed bottles have also been sunk in a similar way, and proved efficient traps, sometimes as many as seven voles being got in a bottle. Very extensive burnings of the 'spret' grass on the hills were resorted to this spring in the hope that the mice might be burned up; but, as was to be anticipated from the known habits of the voles, the little creatures merely retreated into their underground runs till the flames passed over them. Other remedies in great variety, ranging from paraffin and tar to dynamite, have been offered by outside advisers, and many of these real or supposed cures have been tried by the despairing farmers.

Yet the fact remains that although some at least of the proposed remedies would answer the purpose, the hordes of voles remain in a great measure unchecked. The chief difficulty is in getting some sort of concerted action at a given time, for although one farmer may manage to exterminate the mice on his lands, yet, if his neighbours fold their hands and look on, the mischief will in a day or two be renewed to a worse extent than before; for the surrounding lands will simply be relieved of their surplus mice population, and his lands will have got a fresh stock, rendered all the more vigorous and destructive by their change of air.

It is now beginning to be believed by those accustomed to the study of natural-history phenomena that the great mice plague has already passed its maximum. Diseases which follow inevitably on 'over-population' (or over-multiplication) of any animal—from Man himself downwards in the scale—are now beginning to work their usual havoc; the various means of destruction devised by the farmers are now coming into effective operation; hawks, and especially owls, are flocking from all parts of the compass, as is their wont, to the feast provided for them; and although climatic influences—until the heavy rains of the past ten days set in—have been again

in the present spring of the most favourable character for the voles, yet the latter are now so numerous, and have eaten up so much of the herbage, that wholesale hunger—the most powerful of all their enemies—may help to stop their further increase. After all, although the outlook in the meantime is simply ruinous to the sheep-farmers over this great district, which produces such a large proportion of the home mutton and wool supply, there is every reason to believe that the new crop of grass that is to spring up when the vole plague ceases will be a great improvement on the old and effete pastures that have lasted for generations. The seeds that are lying dormant in the soil, the bare stumps of the old tussocks, will spring again with renewed vigour after their severe pruning, and the great mice plague of 1891–2 may ultimately prove a blessing in disguise; but there can be no question it has been purchased at an exceedingly costly present outlay.

WITH IRON WILL.

CHAPTER II.—CONCLUSION.

WEEKS passed away. It was a bleak, gusty night. I had settled at Woking—had, in fact, become the village doctor, if a practitioner without patients may claim the title. I was seated in my armchair, smoking an after-dinner pipe, but in no very cheerful frame of mind. I had caught a chill, having been constantly on the river, in spite of adverse weather, the last few weeks; and as I sat in my study, in a feverish and depressed condition, all sorts of dark thoughts filtered through my brain. In the midst of my sombre broodings the sound of wheels on the high-road caught my ear. Presently there was a pause at the gate. I rose quickly and looked out. It was Colonel Hethersett's carriage. A strong inclination seized me to go out and answer the gate-bell. But I had the prudence, though conscious of a quickened pulse, to restrain my ardour. I threw myself back in my chair, took up a book, and merely glanced round abstractedly when my man came in and handed me a note. I broke the seal without haste—for my servant's eye was still upon me—and read as follows: 'Come at once.—SYBIL HETHERSETT.'

I found her standing on the hearthrug before the fire. She was alone. She came forward, when the door closed behind me, with evident agitation. Her hand trembled as I took it in mine. She looked searchingly into my face. 'You are ill. He told me you were. How thoughtless of me to have sent for you! You ought never to have ventured out on a night like this. I might have come to you.'

I was ill. I felt that the fever had increased, as well it might, since I had quitted my fireside. But I did my best to hide it. She took my hot hand in hers and led me to the sofa beside the hearth. I think I should have fallen but for her aid. I sank down, and again asked her, 'What has happened?'

But although, as I could see, there was great anxiety to speak with me expressed in her face, she took no heed of my question until she had

placed some tea on a little table beside me and had handed me the cup.

'And now,' said Sybil, 'I will answer your question. My father assured me that he should return in good time this evening. It is past eight o'clock; the last train went by an hour ago. If he had come by it, he must have reached home before now. It is scarcely twenty minutes' walk from Woking Station.'

'Would he walk?' I could not help thinking of the lonely road that led by the fields to Woking Hall. 'Did not the carriage go to meet him?'

'No. He was not sure by which train he should come. And he gave strict orders—and you know what that means—that the carriage should not be sent. He has an odd preference for walking home at night.'

I was seriously alarmed, but made a strenuous effort to hide my growing suspicion from her. 'Have you,' said I, 'without any show of eagerness, any special reason for being anxious?'

'You know,' she answered, with her eyes now raised earnestly to mine, 'you know that a danger threatens him; you know that what happened ten years ago—when your skill and devotion saved his life—may happen again. He never speaks to me of this. I dare not speak to him. But I am convinced—as convinced as if my father had spoken—that Kenrick still overshadows his life.'

'Kenrick?' said I, unable to suppress my surprise. 'That man's name, then, Miss Hethersett, is known to you?'

She answered in a quiet tone: 'I was at Cawnpore, and in the house, when my father gave way to his passion. I recollect every detail of the affair. I was nine years old at the time. And when, three years later,' she added, 'that dreadful attempt was made on his life, everything was plain to me. I was then at school, in France; and when I was told about it—and told what a mysterious affair it was—I said nothing. It was no mystery to me. I knew who had struck the blow; I knew it as certainly as if I had witnessed the scene.'

Sybil's manner was still self-possessed; and as I looked into her face I thought I recognised something of her father's undaunted nature reflected there.

I now rose, though still showing no sign of haste; for I would not needlessly alarm her; though the feeling was growing strong within me that I might be losing precious moments. She now left her chair, and coming quickly to my side, placed her hand upon my arm. 'Stay a moment longer,' said she; 'I have something to tell you—something about this man.' Again she paused, expecting no reply. But it was only momentary. She went on in a quicker tone. 'My father's face tells me everything; nothing escapes me, I believe, that passes through his mind. And his face now tells me that no power can prevent a meeting; it tells me that the day is not far distant.' Her look and voice expressed the confidence she felt in every word she now spoke. 'It is inevitable,' she resumed. 'I read in his face that no one—neither you nor I—can turn my father from his purpose. Not that he has moved a finger, during these ten years, to find the man. He would never do that. But Kenrick

is creeping near, with the hope of taking my father unawares. My father knows this, and is on his guard; and in his strange, fearless style, feels a certain pleasure in the situation. I am sure, at least, that he would never step out of his way to avoid a meeting.

Her words confirmed my worst suspicions. The encounter between these two men must sooner or later come. I could no longer hide my impatience to take my leave and go in search of Sybil's father.

Sybil moved towards the window, raised the curtain, and looked out. 'A few nights ago,' said she, almost in a whisper, as though there were fear of being overheard, 'I passed this limekiln in the carriage with my father. I saw a man standing there with the light upon him. I could not see his face, but I read in my father's face who that man was.'

I did not stay a minute longer now. I told her that I would return within the hour, if all that I proposed to do could be done in an hour's time. I went out into the night.

It was not until I was well on the road leading to the limekiln that I thoroughly realised how ill I was. While seated in the drawing-room at Waking Hall sympathising with Sybil in her distress, I was less mindful of myself. But when the cold wind swept gustily about me and beat against my hot cheeks, I began to shiver from head to feet, though sensible all the time of a burning fever within me.

I was approaching the limekiln fire. The light was thrown across the road with a stronger glare, as it appeared to me, than on the night upon which I first passed this way. I stopped for a moment; I tried to collect my thoughts; I tried to put away the swarm of odd fancies that crowded upon me and threatened to conquer my better judgment. If anything in my manner or speech should rouse Kenrick's suspicion—for I had thoughts of confronting this man—if a look of dread escaped me, as I feared it might, the object I had in view might be defeated.

I crept towards the limekiln fire, keeping out of the path of light, until the heat scorched my face. I then knelt down, and leaning cautiously forward, looked about me, while shading my eyes with my hand from the intense glare. The great furnace door stood wide open. The kiln being built up in the low hill-side, the higher hills in the dark background above looked all the darker, with the blue transparent flames appearing and disappearing at the aperture, or chimney, with the grim unearthliness of a witches' bonfire. Down below, in the quarried space in front of the furnace, sat Kenrick. I was bending down quite near him, so near, that by stretching out my hand I could have touched his arm. He was smoking a short clay-pipe, resting his elbow on his knees, and looking intently into the dull quivering glow. What could he see to gaze at so fixedly in that red-hot, gigantic pile of wood and coals? There was a weird, haunted look in his face—a look that brought a new terror to my thoughts.

There was only one thing to be done. Waking Station could be reached in a few minutes; there was a short cut across the fields. I at once determined to go there and telegraph to a friend in London and await his reply—a friend who

knew Colonel Hethersett, and the most likely man to furnish news of him if still in town.

I found the telegraph clerk busy at the wires. When I had written out my message and handed it to him, I expressed my intention to wait for an answer. He looked at me through his little square window with a half-glance of recognition: 'Won't you step inside, sir?' said he. 'There ain't much of a fire,' he added apologetically. 'But the waiting-room is locked up; and it's cold and windy enough out there to cut one to pieces. You'll find the door on your right.'

Tick—tick—tick. He was busy again working at the wires.

I sat down by the fire in the telegraph office and tried to take a more hopeful view of the situation. I began to imagine that the answer was on its way; and that the lengthy pauses, which now took place, expressed a suspended power of volition—that the telegraph clerk was too terror-stricken to complete the message on account of its tragic signification. I became intensely excited. I watched the clerk with a feverish sense of certitude that by studying his face I could interpret these electric sounds. I was on the point of asking him to confirm or dissipate my impressions, when he began to write, with a deliberation that almost drove me mad, upon a telegraph form. This paper he at last handed to me. The words ran as follows: 'Hethersett left London in dogcart at nine.'

I glanced at the clock: it was on the stroke of ten. It would take little more than an hour for an expert driver like Colonel Hethersett to reach Waking Hall.

Once more I started across the fields. The way was dark, so dark, that to attempt running was out of the question, for there was a deep ditch on either side of the narrow path. And as I walked along, tapping my stick in front of me, like a blind man, I kept my eyes wide open; my ears too for the possible sound of Colonel Hethersett's dogcart along the high-road. More than once I stopped to listen and to look out ahead for the slightest glimpse of gig-lamps in the distance.

Stay! What light is that? And surely I can distinguish the sound of wheels upon the road. It must be the dogcart; no one but Colonel Hethersett would drive at that reckless pace along a country high-road on so dark a night, with no lights for miles, except the ghost of one at the cross-roads on Waking Green. Yes; I can see the gig-lamps plainly now, and they look like great blinking orbs flashing out and in, as the trap spins along, passing by trees and hedges and other objects that are frequently black screens between us. And there is still a broad field to cross before I can reach the highway; and before I can even run over the ground the dogcart will have passed the stile that leads out upon the road.

I shout in a loud, distracted voice: 'Stop!' I have attracted his attention: he brings the trap to a stand-still. But I now begin bitterly to repent having raised my voice. For I see the reflected light of the limekiln fire right ahead in the night; and I know that my shouting will have reached Kenrick's sharp ear. He will see the dogcart; for Colonel Hethersett is stopping at the limekiln. They will meet face to face.

I have no distinct recollection of how, either running, walking, or stumbling, I gained the highway. But I did gain it, and in an amazingly short space of time; for as I sank down exhausted at the stile, which nearly faced the limekiln, I saw Colonel Hethersett pulling in rein just within the path of light that always streamed across the road; at the same moment I saw Kenrick start up from the ground within reach of the dogcart, raise his arms, and straighten his back, as if nerving himself for a spring.

'Hold my horse,' said the Colonel in a firm voice, as he flung the reins across the animal's back. 'Don't stand staring there. My name is Hethersett'—

'Is it?' interrupted the man. 'Do you think I don't know you?'

'I'll not dispute it. Hold my horse.'

'Do what?' said Kenrick; and glancing savagely about him, he selected a stone the size of his great fist, and hurled it at Colonel Hethersett. The stone, flying within an inch of the Colonel's head, dropped into the hedge beyond.

From the point where I had sunk down against the stile, the whole scene was visible to me in the light of the limekiln fire. The iron door was wide open, as I had seen it an hour ago, and the heat and glare struck upon Kenrick's threatening figure as though stimulating his awakened passion. Colonel Hethersett had risen from his seat in the trap and was stepping down. From first to last his eyes were fixed upon the man's face. No movement escaped him.

'Why did you cry out?' said the Colonel sternly.

'When?'

'A moment ago. You cried out "Stop."'

'Never!' Kenrick answered sullenly.

'No? And yet the voice came from this quarter,' said the Colonel. 'You heard it; didn't you?'

'What if I did?'

I could see both their faces distinctly now. I could see that Kenrick was quivering with suppressed rage and fear. But Colonel Hethersett's look was cool and determined.

'Kenrick,' said the Colonel in a quick tone, 'the time has come for a settlement between us. It is now thirteen years— Ah! you have not forgotten: I know that. For twice since then you have made an attempt on my life: in Smithfield ten years ago, and again to-night.'

Kenrick made no reply; but I could see that the Colonel's dauntless manner, his stern voice, and penetrating look, were beginning to assert their influence over the man.

'Now listen to me. You brought upon yourself the punishment I gave you,' said the Colonel, 'by disobeying my orders. If you did not learn a lesson then, it is time you learnt it now! When I drew up here a minute ago and asked you to hold my horse, you refused. I am going to give you one chance more,' he added. 'You say you didn't call out to me to stop. Some one did; and I am going to satisfy myself instantly on this point. I am going to make a search along the road. You've a lantern, I suppose? Lend it to me.'

Still no reply: no movement on Kenrick's part.

'Have you a lantern or not?'

'Yes; one or two, I reckon.'

'Lend me one,' repeated Colonel Hethersett.

Kenrick hesitated still; but it was only for a moment. There was something in Colonel Hethersett's whole attitude that appeared to bring the man suddenly to a better sense of the situation. He crossed over to the hut, went in, and slammed the door angrily behind him. The Colonel paced slowly up and down always within the light of the fire, and always with his look directed towards the hut. Presently the little round window brightened, as if returning his glance; and a moment afterwards Kenrick came out lantern in hand.

'Thank you,' said the Colonel. 'And now, Kenrick,' he added, 'look after the horse.'

He took the lantern and turned away; and for the first time, since this meeting between them, Colonel Hethersett relaxed his watch upon the man. He stepped across the road, and soon caught sight of me lying helpless by the stile. He lifted me tenderly in his strong arms as he would have done a child. 'Sherwin, my dear boy! Why, how came you here?'

I can recollect seeing Kenrick leading the horse towards the spot. I have a dim recollection of being in the dogcart with one of Colonel Hethersett's arms claspng me securely; and I have a dimmer recollection still of the limekiln fire suddenly going out, as though an extinguisher had been put upon it. I remember no more.

And then there came a semi-consciousness of distracting dreams that recurred a thousand times during a night that never had an end. It fell dimly upon my senses that I was lying within the limekiln fire with heaps of red-hot coal on every side threatening to consume me; and all the while Kenrick was looking at me with stolid eyes as he smoked his pipe and tacitly refused to drag me out. At other times the telegraph wires at Waking Junction were passing through me with the central station in my head, which became overcrowded with messages.

These feverish 'imaginings' and a hundred others at last passed away, and less startling ones fell into their place. Once more I found myself in the heart of a certain wood, where a stream was flowing between high banks into a large river beyond. I was lying in a boat and looking down into this stream, and a face was looking up into mine. Yet there was no blue sky—no cluster of leaves, only the face; and this face gradually took the shape of Sybil's face in my brain. But there was no look of laughter. The eyes were filled with tears, and the cheeks were pallid and thin.

'Sybil!'

The sound of a sweet voice touched my senses. 'Hush! I will go and tell my father'—

'No. Tell me! Am I awake or dreaming?'

I lifted my heavy eyelids like one coming out of a deep sleep and stared perplexedly about me.

'He brought you here'—

'Last night?'

'No. It will be three weeks to-morrow.'

I could not speak. A mist seemed to be gathering between her face and mine. She held a cup to my lips. I drank a refreshing draught, and then sank back upon my pillows into a dreamless sleep.

When I awoke it was night. The window curtains were now closely drawn, and I heard the wind whispering in the park outside. There

was no light in the room except from the fire. In an armchair, drawn up in front of the hearth, sat Colonel Hethersett.

Knowing this man's character as I did now, his manliness and tender nature, I felt that to express in words my sense of gratitude would be to lower myself in his esteem. It had been my privilege, ten years ago, to save his life. He had now saved mine.

It seemed to me as though I was waking into a new life—a new world—as I lay here contentedly watching the changing lights and shadows upon the walls, and listening to the red-hot cinders falling with a soft metallic ring. And if I was reminded of the limekiln fire and the terrors it had roused in my mind, there was no sense of dread awakened now. For I read in Colonel Hethersett's face, as he sat pondering there—as Sybil had doubtless read too—that all fear of danger might be dismissed from our minds.

Happening to pass the limekiln one night, a month or two after my recovery, I noticed a strange watchman standing there.

'Where is Kenrick?' said I.

'Overseer up at the Hall.'

'On Colonel Hethersett's property?'

'Yes.'

I was not surprised at this news; for, although the Colonel managed every one with iron will, I never knew a more generous master. And Kenrick proved an excellent servant. So long as they lived, he and the Colonel never exchanged another angry word.

The autumn again came round. One sultry afternoon—an afternoon never to be forgotten—I was walking with Sybil in Woking park and by the river-side.

'Is it only a year?' she was saying as she stopped; and bending forward, she peered into the stream.

'A year to-day.'

She made no reply.

'Sybil,' I went on, 'I know you love me. But tell me so here, where we first met!'

Still gazing down into the stream, she whispered it. Then she added: 'And I thought that afternoon, only a year ago, that I should never see you again.'

THE MONTH:

SCIENCE AND ARTS.

At the recent soirée of the Royal Society, an annual event which is always looked forward to by Londoners of scientific tastes, there were two exhibits which attracted more attention perhaps than any of the others. The first was the method shown by Mr Ives of producing in a photograph the colours of Nature without the use of pigments. Briefly described, this method consists in obtaining by means of a compound camera three different negatives of one object, which may be a painting or a natural landscape. By associating each of these negatives at the moment of exposure in the camera with a light filter, one of them is excited only by rays representing the fundamental red sensation; another by rays representing the

green; and the third by rays representing the blue-violet sensation. Positives from these negatives are placed in a triple lantern, the light passing through each being filtered through screens of coloured glass—red, green, and violet respectively. When those three coloured images are superposed on the lantern sheet, they coalesce, and the result is a very perfect copy of the coloured original.

The other exhibit at the soirée which met with equal attention was the collection of photographs of bullets in flight taken by Professor Boys. The method by which this seemingly impossible feat is brought about is very ingenious. The camera and lens are dispensed with altogether, and by their rejection the operation is at once much simplified. In a dark chamber the apparatus is arranged, consisting of an electric spark contrivance, which furnishes the light required, and a sensitive gelatine photographic plate. Over this plate, a rifle bullet, fired through an aperture in the chamber, wends its rapid flight, and in doing so touches two wires. This touch gives the necessary metallic contact to induce the instantaneous flash of the electric spark. The light causes the shadow of the bullet to be cast upon the plate, and this shadow makes a permanent record when that plate is afterwards developed. The most curious feature of these pictures is that the air-waves due to compression and rarefaction in front of and behind the bullet are distinctly marked.

The Royal Commission for the Chicago Exhibition, whose headquarters are the Society of Arts, London, have just issued a little handbook which will be useful to intending exhibitors, for it gives all particulars as to routes, tariffs, and regulations. In the department devoted to Electricity, it is especially pointed out that from a British point of view it is most desirable to show how large a share our electricians have had in developing this branch of science and its practical applications. Looking backward, we find that the first electrician was Gilbert; that the first practical telegraph line was worked out by an Englishman (Ronalds, in 1816), and perfected at a later date by Cooke and Wheatstone. The germ of the modern dynamo-machine—which will possibly revolutionise our mechanical industries—was discovered on Faraday's lecture-table, and afterwards applied by Wilde, Holmes, and others. And lastly, we can point with pride to the honoured name of Davy.

In a recent lecture on 'The Venomous Snakes of India and the Mortality caused by them,' Sir Joseph Fayrer said that although the chemistry of snake-poison had been much studied of late, no antidote to snake-virus had yet been found. Remedies were of little avail when the full effect from a bite had been produced; but when the poison had entered the system in smaller quantity, medical treatment might be of some service. The poison can neither be sucked from a bite nor swallowed with impunity. After naming the different snakes found in India, of which the cobra is the most formidable, the lecturer pointed out that the average loss of life for the eight years ending 1887 was nearly twenty thousand human beings, and more than two thousand head of cattle yearly. To reduce this

alarming death-rate he thinks that the best plan will be to make more fully known the appearance and habits of these dread reptiles, and to give a reward for each poisonous snake killed. The proposal to cut down and clear away the jungle in the vicinity of villages could, he thinks, hardly be expected to produce the desired effect.

The soil in winter-time is often frozen so hard that excavations are impossible, and all such work has to be postponed. Mr Kelly, superintendent of the Gas-works at Waltham, U.S.A., in a paper recently read before the New England Association of Gas Engineers, has described a method whereby this difficulty can be obviated. His system is to spread a quantity of lime some inches deep over the place where the digging has to be done. A piece of tarpaulin is spread over the lime and left there for several hours. Experience shows that by the warmth thus induced frost nearly two feet deep can be quickly melted. The lime presents an objection in many cases on account of its expense, but gas companies can afterwards employ the spent material for purifying purposes.

Railway travellers must have often experienced a difficulty in finding the compartment of the carriage in which they have been sitting, after having left it at any intermediate station for purposes of refreshment. M. Cros, a French gentleman, has suggested a method of putting an end to this difficulty. He suggests that the door of each railway carriage should, like a hotel or inn, bear an easily recognised sign. This might be a picture of a bull, swan, elephant, or any other familiar object, so long as it served the purpose in view. This plan would also be valuable in the case of a passenger forgetting a parcel or other article left behind in a carriage and finding it necessary to telegraph for it.

It would seem that the art of line-engraving on steel must now be looked upon as lost. For the last artist who devoted himself to this beautiful method of pictorial illustration, Mr Lumb Stocks, has recently gone to his rest. Another artist, who made a name in this work, is reported to have said that he was of opinion that this particular branch of art would soon become obsolete. He believed that photogravure was beating it out of the field. There are effects, he said, produced by that process which the line-engraver can never possibly approach. The photogravure is no doubt a most beautiful process in affording a faithful reproduction of every touch of the oil-painter's brush, but at the same time all lovers of art must regret the decline of a method in which British artists have always shown such pre-eminence.

After many experiments, the locomotive department of the Great Western Railway in the Argentine Republic have mastered the problem of using petroleum as fuel instead of coal or wood. The crude oil, which is about as thick as treacle, is brought down to the works of the railway by pipe, and stored there in a large tank capable of holding three thousand tons. It seems, however, that directly all difficulties had been conquered, the supply of oil failed, and the companies have now to go back to the old way of firing their engines. The Petroleum Company have not, it is stated, carried their borings deep enough, and fresh work must be

undertaken before the oil-wells will again afford their yield.

A curious instance of the way in which the value of a work of art is increased by being associated with the name of a painter of merit is afforded by a case which occurred at the recent Naval Exhibition. Many visitors to that Exhibition will remember a large picture entitled 'The Embarkation of Katherine of Braganza to marry Charles II. of England.' This picture, by an unknown artist, happened to be hung next one which had already been sent by the Earl of Sandwich, the title of which was 'The Battle of Solebay,' painted by Van de Veld. It was not until these two pictures were seen hanging together that it became evident to experts that both were by the same hand. The colouring, the design of the ships, their form, decoration, and rig, all told this most plainly. The immediate result of this discovery was that the value of the first-named picture was raised from five hundred to five thousand pounds for insurance purposes.

At the request of the British shipowners, Sir Frederic Abel and Mr Redwood have been investigating the question of transporting petroleum in bulk through the Suez Canal, and have just issued a Report thereon. They consider that the passage of tank steamers laden with oil must involve great risk to other vessels using this important waterway. The atmosphere on the Canal, as well as the water itself, is at such a temperature at certain seasons of the year, that the risk arising from an outbreak of fire, or explosion of a mixture of oil-vapour and air on board a vessel, would be grave. They also consider the danger of leakage in the case of the collision or grounding of one of these tank vessels, from the presence on the Canal of many lights, some of which are gas buoys floating on the water, would make the ignition of the oil almost a certainty. The authors admit that these risks might to some extent be reduced by proper stipulations as to the construction of the tank vessels and the storage of the oil; but still they consider the whole question involves elements of danger which it would not be wise to risk.

Boat-propulsion by means of oil-engines is certainly on the increase, and is likely to present a real rivalry to the employment of boats driven by electricity. The system presents many advantages. To begin with, it is economical and safe, there is no boiler, a complete absence of smoke, a great saving of room which can be devoted to other purposes, and a saving of time in obviating the necessity of getting up speed. On the Manchester Ship and other canals many such vessels are employed; and on the Thames every season some may be seen which have superseded the more common steam-launch. A small boat of this kind has recently been tried at Govan. The engines in this case are of five horse-power, and make about two hundred and eighty revolutions per minute. Ordinary mineral oil is used, and enough for a week's working can be stored in the vessel.

The great inland sea of North Holland, the Zuyder Zee, was up to the twelfth century a lake, but at that time it was united to the North Sea as the result of an inundation. For a long time past the Government of Holland have had

under consideration a project for draining this vast piece of water. Large vessels now make their way to Amsterdam by means of the North Sea Canal, the water being far too shallow in the Zuyder Zee to accommodate any but the smallest craft. Useless to Holland as a piece of water, the land for agricultural purposes would, if it could be drained, be very valuable. It has an area of seven hundred and sixty square miles. A Report recently issued on this subject by a Commission which was appointed some time ago to thoroughly examine the question, proposes to close the Zuyder Zee by means of a dam. The area would then be divided into four parts, and the work of draining would be carried out successively in each. The total cost, including the construction of the dam, would be about seventeen million sterling. The Dutch engineers have in past times shown themselves such adepts in recovering land from the hungry sea that they have adopted a proverb which says, 'God made the sea, but we made the land.' There is little doubt that if the financial difficulty can be met, the engineering work can be accomplished.

The theft of electricity is a new crime which the progress of science has called into existence. A case recently came before a certain law-court in the United States in which a man with some knowledge of electricity caused the meter which registered the amount which he used for illuminating purposes to record less than he had consumed. The lawyer who defended him ingeniously argued that as electricity was an intangible something of which no one could really state the exact nature, and that as at common law it was actually unknown, his client could not be convicted of stealing it. But the lawyer met with his match on the other side in one who showed that gas was also unknown at common law, but was recognised as a thing that could be stolen. In the sequel the judge took advantage of a certain statute which makes fraud committed with a view to theft, a felony, and the man who stole the electricity is therefore likely to meet with the reward of his misdeed.

A metallic alloy, closely resembling gold, which has a fine grain, is malleable, and does not easily tarnish, is described in one of the technical journals devoted to the jewellers' art. The process for producing this alloy is as follows: Pure copper, one hundred parts, is melted, and to this are gradually added fourteen parts of tin or zinc, six of magnesia, fifty-six of ammonium chloride, eighteen of quicklime, and nine of cream of tartar. This mixture is melted and stirred in a crucible for half an hour, after which it is kept in the molten state for another like period. The dross is then removed from the surface, and the metal poured into moulds.

Among the most important modern applications of electricity is that of heating and welding by the electric arc. The system which has been found to give the best results is that known as the Benardos-Howard Method. To give an idea of the way in which this work is carried out, we may describe the method by which a fractured church bell of large size was recently mended. The bell was so connected with the dynamo-machine which furnished the necessary electric current as to form one of its poles; the other pole of the machine was connected

with a tool having a carbon end. Upon turning on the current and approaching the carbon point to the cracked place, the metal was immediately brought to a white-heat, and the fractured edges were welded together. By no other means could the bell have been mended. The same system is often used in welding together iron and steel tubes, iron barrels for petroleum, &c., and is employed in repairs to steel castings and engineering work of all kinds. Messrs Lloyd and Lloyd of Birmingham and London are the pioneers in this useful branch of manufacture, and they have at present half-a-dozen large Crompton dynamo-machines constantly employed in furnishing the necessary electrical energy.

At a recent meeting of the Chemical Society, a new Egyptian mineral, to which the name of 'Masrite' has been given, was described. Examination proved this mineral to be a variety of fibrous alum, and, from the fact of from one to nearly four per cent. of cobalt being found in different samples, it was thought that the blue colour used in paintings on Egyptian monuments might be due to that pigment. Analysis of such paintings, however, showed that the blue colour was due to compounds of copper and iron. The principal interest attaching to the mineral lies in the circumstance that it contains a minute quantity of an unknown substance, believed to be a new element. To this hypothetical body the name 'Masrium' has been given, from the Arabic name for Egypt.

Mr W. C. Andrews has patented a plan for supplying fuel in an altogether novel way. He suggests that at the coal-mines the coal should be reduced to a fine powder and mixed with a large quantity of water, so as to form a thick liquid having the appearance of ink, and that this mixture should then be pumped into pipes by powerful engines and carried to any convenient point. The liquid would have to be forced through the piping at a speed of from six to seven miles an hour, so that the coal-dust should have no opportunity of settling before it arrived at its destination. Here it would be discharged into tanks, where the solid portion would gradually settle to the bottom, and the sediment so formed would afterwards be collected and compressed by hydraulic rams into blocks of convenient sizes for fuel.

All collectors of books look upon a copy of the folio edition of Shakespeare, dated 1623, as the very coping-stone of their ambition. Copies of this edition are now so rare that recently one was offered for sale for one thousand pounds. Students have now, however, an opportunity of obtaining a fac-simile copy of this work, which is being reproduced by the Dallastype Process, and a copy so exact that little mistakes in pagination and the irregular modes of spelling in vogue in the seventeenth century, are faithfully reproduced. We have recently had an opportunity of examining an advance copy of this work, which is being published by Messrs Garratt & Co. of Southampton Row, London.

Forty-three years ago there were described in our own pages the wonderful and novel effects which were then obtained by means of the magic lantern. Since that time the magic lantern has been so improved that it has ceased to be a toy

for the amusement of holiday folk. It is now to be found in every school and lecture theatre in the world, and is used not only for diagrams and microscopic projections, but also for experimental demonstrations. It is curious to compare the old form of lantern with its roughly-painted pictures on glass, with the modern instrument with its perfect photographic slides. The most perfect instrument ever seen was recently shown at the Crystal Palace, Sydenham, where, by means of a powerful electric arc light, and lenses purposely made for the lantern by Dallmeyer, pictures were shown with a brightness and on a scale hitherto unprecedented. Lantern demonstrations by means of this unique instrument have recently been given daily in connection with the successful Electrical Exhibition which has already received notice in these pages.

AMONGST THE RUSHES.

THE splendour of midsummer sunshine is once more over all the earth; the air is hot and still, and the quivering heat seems to radiate from the ground; the scent of hawthorn and newly-cut clover is all round. The morning is so absolutely perfect as to leave nothing to be desired save the low musical lapping of water. So once more flannels are put on, and the boat is in readiness for a long dawdling day upon the river. How delicious is the sense of life, as the boat glides smoothly through the gently-flowing river! How joyous are the larks, as they mount, singing, into the hazy blue; and the atmosphere seems filled with a drowsy murmur from the myriad armies of insect life. The limes have just begun to open their luscious blossoms to the eager bees. In the deep, green, translucent water is reflected the delicate feathery almond-scented meadow-sweet, the purple loosestrife, and the red and white champions that grow luxuriantly along the banks, amongst their green setting of reeds and rushes. Through the drooping boughs of the gray-green willows streams the sunshine, making dancing golden lights on low-growing cresses and forget-me-nots, and the little rippling splashes round the stones and hollows along the banks.

Flitting butterflies of gorgeous colours hover over the blooming grasses and ox-eye daisies. The tiny black chicks of the moorfowl hide and nestle amongst the bunches of dried grass during the mid-day heat. How silent are the long stretches of country on either side of the river! The panting sheep are gathered under the trees; cattle are resting in the scant shade of the low-cut hedgerows, or have waded deep into the river in the cool little backwaters, amongst the reeds and sedges. In the distance, the clink of a mowing-machine can be heard; and field after field of freshly-cut grass lies in long swaths, waiting for another machine to turn it over; for the troops of merry rustics, with their bare arms and sunburnt faces, are rarely seen anywhere now, and both rural life and the pleasant aspect of the country have lost much of their ancient charm. The comfortable old-fashioned farmsteads have fallen into decay, or are left untenanted; cottages have been turned into barns or shedding for cattle, and often pulled down entirely; and both masters and men have drifted into the

towns and found employment in the manufacturing centres. Yet still the river flows on in its old channels; still the swift and swallow skim the surface, darting and diving after the flies and midges; still the reeds and rushes sway and bend in the old way; and as the boat is shoved amongst the thick tangle of river-side herbage, the noisy willow-wren chirps sharply to her mate as her especial domain is invaded; the water-rats dive hastily into their holes; and shoals of minnows and gudgeon wriggle away into the shelter of the rushes, and are lost in the wide sweep of the river.

How cool and fragrant the air is in this dim shut-in hollow of the beech-woods; and the entrance is so hidden amidst overhanging brambles and briar roses, that a stranger would pass fifty times and fail to discover its whereabouts; but turn the rudder to the right, crash through the bed of rushes and foxtail grass, and three or four back-strokes bring the boat floating out on a deep silent pool, that mirrors the dense foliage and thick smooth trunks of the giant beeches, and the deep overhanging banks hollowed under the twisted rugged roots, where, amongst the damp water-weeds and mossy stones, grow marvellous bunches of hartstongue ferns, their dark-green glossy leaves perfect in shape and colouring.

There is always a whisper of wind among the beeches, that mingles with the lazy caw of the rooks and faint cooing of the stockdoves, and is pleasantly suggestive of the low sound of the summer sea—

And the beech-trees murmur lowly
Strange old dreamings, half awake,
As we glide beneath them slowly
O'er the forest-girdled lake.

What a charm there is in the silence and solitude when the boat is moored, and only the low slumberous lap of the river is heard a few yards away, to gaze into the dark fathomless pool, or up into the tangle of intersecting boughs and leaves, through a rift of which can be seen a glimpse of far-off sunny blue!

At first, the silence seems unbroken; then gradually little sounds of life are heard. Yonder is a tawny squirrel alert amongst the dry grass; and those frisky atoms of fur most certainly are a young family. Two or three sandpipers fly off with a startled 'tweet, tweet,' among the flags; a pair of comfortable wild-ducks are catering for their dusky downy brood; a moorhen steals softly away through the sedges; far off, in the distance, the cornrake can be heard in the barley on the sunny ridges; greenfinches and yellow-hammers are rustling in the thickets of bramble-bushes; over the pool the midges and gadflies dance and sing, making a vague murmur in the air, as if whispering together about the beauty of their short-lived summer kingdom. There is a winding path through the woods a few hundred yards up the hill; on the other side, about midway down the western slope, stands an old brown manor-house, whose massive walls are nearly hidden in ivy and clustering roses. The windows are deeply mullioned; the chimney stacks are fancifully twisted; the pointed gables and wide porch curiously decorated and carved with symbolical figures. From the wide sunshiny terrace-walk on one side is seen a richly-wooded landscape

of hill and valley, the little town half-way up, on the opposite hills. On the other side lies the sweet-scented old-world garden, where honeysuckle, musk-roses, jasmine, huge lavender bushes, and giant magnolias fill the air with perfume; thick yew hedges, many centuries old, enclose the broad shady tennis courts. There are long green alleys of quince and apple, filbert and pear trees, clusters of lilac and laburnum, and guelder roses round the lawn. Clear and cool, the 'lily-padded lake' gleams beneath the silver birch and quivering aspen, creeping lazily under the shady trees till it joins the meadow-stream and falls into the quiet pool below the mill.

History tells of the old manor as having once belonged to the Jesuits, where dwelt one of those strictly-closed orders of which the world hears so much and knows so little. It may have been so, for on the north side of the manor there is a curious little building with two beautiful twelfth-century windows, that probably was a small ante-chapel in its palmy days. The capitals of the columns are quaintly carved with heads of animals and human faces; and in one corner is a rudely-cut stoop set in the angle of the wall. It is thickly overgrown with white-veined ivy, inside and out the building, and is used in this prosaic nineteenth century as a summer smoking retreat.

Very beautiful looks this 'haunt of ancient peace,' this sunshiny July noon; very lovely this wide wind-swept landscape of 'hill and valley, lake and lea;' but the river has a still greater fascination; and the dreamy hours idled away along the banks, watching the swirling brown and green water making foaming eddies round the drooping willows, the sand-martins hovering over the rushes, the graceful sweeping reeds and the long feathery grasses moving with every breeze, and listening to the gentle ripple of the tiny wavelets on the sides of the boat—are hours that do not come too often in a lifetime; for one day that can be spent with pleasure on the river there are hundreds that are fit for walking or driving. Then, if the heat of the day has passed, and the quiet becomes monotonous, row down stream a mile, and the hollow roar of a great tumbling weir is heard, and the cry of 'Look! look!' The great green gates slowly open, and the boat is shut within the deep cool lock, and the roar of the weir is like the sound of thunder. Slowly rises the dark water, and the boat floats out on the shining placid river.

There is life and bustle here: two men and a boy are busy mending and tarring a punt; half-a-dozen youngsters playing and tumbling in and out a leaky, old, flat-bottomed boat, laughing, shouting, and scrambling in reckless glee. Two red-faced bargewomen, with violent gestures, are quarrelling shrilly; a stout girl in short blue skirt and red jersey is winding up the closing lock gate with one hand, holding a screaming infant in the other. Over the weir rush the smooth sheets of translucent green water, falling into the torrent below in great foaming billows, that rise again in impalpable spray, making numberless bits of rainbow colouring in the evening sunshine. Farther down, a fussy little steamer has brought a party of merry young folks to a rustic bungalow, standing in the shade of a noble group of chestnuts. The bright-faced girls look radiant

with happiness, and the men quite capable of enjoying their company. What wonder that, under the influence of the glowing evening, they feel a delight to live and breathe, the tide of healthful life bounding in their veins adding to the natural enjoyment of youth. The glory of summer clothes the hills, uplands, and valleys, the moors and the meadows. The wild exuberant beauty of coppice and woods, the lush leafage of the hedgerows and river-side, the singing of bird and insect life, all give to the thoughtful mind the unmistakable proof of the inherent power of Nature.

But the glory of sunset light has begun to fall across the hills and golden-green woods; the distant purple shadows grow deeper; the air is stiller than ever, save for the shrill singing of the swifts as they rush through the air; when the lock is passed again, and the roar of the weir faint in the far distance, the soft gray mists can be seen stealing up the river, and a faint warm wind sighs through the reeds and rushes, heavy with the scent of clover hay. A humble-bee booms lazily under the willows; gray and white moths flutter round; bats whirl erratically about, with their faint little cry; gradually the crimson sun has dropped to the under-world, and in the faint afterglow hangs a single golden star, with scintillating rays of green and sapphire and purple; and in all the blue immensity of space appear twinkling points of light, that are reflected in the water, and a breath of the lindens comes in the whispering shadowy darkness. The boat touches the landing-steps, the oars are shipped, and our day amongst the reeds and rushes is over.

HEART-STORMS.

THE shadow of night is falling,
But the shore is sunlit yet:
Oh tranquil tide, what a flood you bear
Of bitter and wild regret!

When the storm your waves uplifted,
When the wind was wet with spray,
My heart was eased of its long dull ache,
And I looked from my grief away.

'Tis when all is calm and peaceful,
When at rest the whole world lies,
That the heart is stirred with a storm unseen,
And utters its lonely cries.

P. W. ROOSE.

PICCADILLY.

PICCADILLY! The historian, the essayist, the wit, the poet, all have sounded thy praises. Highway of fashion; channel through which unceasingly flows the brilliant stream of humanity which the exclusive West sends in search of pleasure and variety; beloved of loungers and beaux; happy hunting-ground for artists, dilettantes, and man-about-towns; ever-varying spectacle for country cousins—it seems almost a forlorn hope to endeavour to say anything fresh about thee, most delightful of streets.

Piccadilly is never monotonous. Either from shop-windows or passers-by, one may always gather amusement and perhaps instruction. True, it is to a great extent the street of a class. More respectable than the bohemian Strand, less prosaic than middle-class Oxford Street, its crowds are composed for the most part of that section of metropolitan humanity popularly known as the 'Upper Ten;' yet there is always sufficient leaven of the common multitude to add variety to the scene.

Turn in to it from the Circus, that vortex of traffic, whose clatter and confusion are calculated to bewilder even the accomplished urban traveller. Swan and Edgar's gay Oriental exhibit, and the neighbouring shops on the one side, make a pleasing little oasis of colour, in strange contrast to the grim frontage of the Museum of Practical Geology and Royal School of Mines over the way—truly, of all the places in the metropolis devoted to relaxation and improvement, the gloomiest and least exhilarating. Well does the writer recollect how as a boy he spent Wednesday half-holidays within its echoing and deserted halls; and the depressing remembrance of those juvenile dissipations amidst the models of coal-mines and specimens of strange and stony formations, lingers even yet.

Glance for a moment opposite at the unpretentious book-shop with the royal arms over the door. Few would think that so unpromising an exterior holds the most remarkable bookselling

business in the world, yet the name of Quaritch proclaims that here are the headquarters of the extraordinary man whose career has been a succession of bibliopolical triumphs; and here are gathered together more rare and valuable volumes than in any space of the same size outside the British Museum or the Bodleian.

Air Street—aptly named, being a very sigh of a street for brevity—marks what in 1659 was the most westerly turning out of Piccadilly, the whole district beyond being fields and lanes, and opposite we may look through the iron gateway at St James's Church, erected for Henry, Earl of St Albans, in the days of our lugubrious-looking 'Merry Monarch.' This nobleman is perhaps chiefly notable, or rather notorious, as uncle of the 'Harry Jermyn' whose escapades are frequently referred to by Grammont, which gentleman, under-sized, ugly, and, if all accounts be true, stupid as he was, seems to have been a very prince of Lotharios.

The church is a comparatively uninteresting building so far as architectural merit is concerned, very prim and formal in its seclusion behind the red brick wall. There is a white marble font by Grinling Gibbons, the canopy of which once served as strange a purpose, surely, as ever a font-cover in this world—that, namely, of a tavern sign, when stolen by sacrilegious hands. Some famous names are connected with the building. Adam Clarke, ripe scholar and upright man, was pastor for a time. Several celebrities also are buried here: Charles Cotton, who travestied Virgil, poetical historian of the Peak, and disciple of the gentle Izaak; Dr Thomas Sydenham, whose system of fever treatment marks an era in our medical history; a brother physician, Arbuthnot, whom Thackeray has dubbed 'one of the wisest, wittiest, most accomplished, gentlest of mankind,' and to whom we owe the invention of 'John Bull,' that title which so happily hits off the national characteristics.

Another doctor, but of a very different sort, also lies here—the merry deviser of those

famous *Pills to Purge Melancholy*, which cured so many of the spleen and the doldrums—witty, thriftless, coarse, yet withal genial, Tom D'Urfey. How his ballads must have been shouted and roared by the roystering blades who swaggered from tavern to tavern in those days! Glancing through the six chubby volumes which comprise the collection of these ditties, one must perforce wonder how any period, any society could tolerate some of them. Others there are less questionable, whose themes are as a rule drink and joviality, many written, doubtless, at my Lord Buckhurst's seat of Knowle, in Kent, where the poet-laureate of tavern and suppers had a room always prepared for him, and where he sang the praises of 'the Incomparable strong Beer at Knoll.' He must have been a lovable bohemian, this man, 'whom envy and spite could never sadden.' He lived to see the reign of Anne with its circle of wits and beaux, of so different a cast from those he had known in his prime; and the queen favoured him on the quiet, nor disdained to listen to his songs and jokes at her private supper-parties.

Sackville Street boasts a double singularity: it is the longest street in London without a cross or by-turning; and it has no lamp-posts, the gas lamps being fixed to arms projecting from the houses. The shop at the west corner is always an attraction, the name of Fores having long been known in connection with those coloured sporting prints which depict in such animated style the victories of the turf and the hunting-field. The most popular are the reproductions of the old pictures our sportive forefathers delighted in: 'The First Steeple-chase on Record' showing a number of eccentric gentlemen careering across country on thoroughbreds, with white night-shirts and night-caps as riding costume, or the 'Departure of the Rover' or the Firefly for Exeter, Liverpool, or York, with all the quaint surroundings of galleried inn-yard and many-caped passengers. Such subjects as these are still sought for by the sporting collector, and at Fores' he may find them in variety enough.

Princes Hall, a somewhat blank-looking structure, is chiefly noticeable for the boldly carved figures which surmount the doorway in the centre; while the Albany opposite stands the personification of solid respectability, and brings back to us Canning, Bulwer-Lytton, and Lord Macaulay. The great essayist lived here for fifteen years, and wrote most of his wonderful History within its walls. Byron, too, had rooms in the building; but we shall meet his erratic lordship later on.

The splendid frontage of Burlington House attracts attention next. It is curious to remember that its predecessor on this site was erected because its owner was sure no one would build beyond him! and was the first good house in Piccadilly. The present palatial edifice shelters numerous learned corporations, most of them familiar enough by name, though the functions of some are to the uninitiated public rather obscure. The best known and most popular of all is the Royal Academy—the 'Forty Immortals,' to borrow from our French neighbours, or, as some wag has put

it, the 'Forty Thieves.' Who would see fashionable London in a small space must stand within the fine courtyard on 'Private View' day, when every one who is any one worth mentioning flocks to see the pictures and each other.

Burlington Arcade, chief temple of frippery and frivolity, presents an unchanged aspect from year to year. The same shops, the same kind of wares, the same loungers, who never seem to buy. Are there any people bold enough to purchase goods in Burlington Arcade? There always seems such a sublime air of dearness about the daintily arranged little emporiums, that one could almost fancy seeing above each doorway, 'Highest prices for everything charged here.'

The Egyptian Hall remains the most distinctive building in London. This reproduction of an old temple sacred to the mystic rites of Isis looks strange enough in the midst of its busy nineteenth-century surroundings. The Siamese Twins; the Model of Waterloo; Tom Thumb, drawing his hundreds, while poor Haydon's works of art were disdainfully neglected in a neighbouring chamber; Albert Smith's inimitable jaunt to Mont Blanc; and nowadays the perennial séance of mystification presided over by Mr Maskelyne—these are brought to our minds as we linger awhile outside the curious frontage.

Arlington Street, quiet, sedate, and replete with memories, recalls some people famous in their day, and one at least famous now. Harry Bennet, Earl of Arlington, at one time high in favour with the monarch who 'never said a foolish thing;' but, like many others, falling into disrepute so far even as to become a laughing-stock with the frivolous good-for-nothings who fluttered round the English court.

Horace Walpole is another figure we associate with Arlington Street, where, as a boy, he listened at his mother's knee to that small-talk in which he was one day to prove so proficient. Many of his delightful letters date from thence, though Strawberry Hill was to witness the arch-dilettante at the summit of his fame. The present Prime Minister has his 'family mansion' here, sheltered behind a wall, in front of which a solitary policeman keeps guard over the residence of the Queen's chief adviser, in strange contrast to the elaborate military precautions one finds abroad in a similar case. Hatchett's, opposite, looks sadly shorn of its glories, now that the ground floor is given up to miscellaneous shops, and the upper part turned into sets of chambers. The entrance to what was the White Horse Cellars remains, it is true; but the coaches seem to be divided in their old allegiance, some going to the Bath Hotel opposite, and others preferring the modern Northumberland Avenue. Few prettier sights can London show than the evening arrival of these smart four-in-hands, as they come dashing up the hill from the corner through the stream of vehicles. The rays of the sun, setting beyond the Park, light up the red coat of the guard and the burnished coach-horn on which he sounds a merry note or two as the splendid horses, skillfully steered, go spankingly over the wood pavement, to all outward appearance little the worse for their long run.

With a brief survey of Walsingham House and the adjacent Club, which form so prominent a feature in the view as one looks up Piccadilly

from the west, let us turn a moment to the Duke of Devonshire's grim barrack, secluded behind one of the ugliest dead-walls in London. There is only one redeeming feature in this bare expanse—the remarkably beautiful bronze handles on the entrance gates. The house itself is a mean building, yet shelters priceless treasures of art. We may aptly cast back a thought to the fair Georgiana, who held her court here, assembling all who were noteworthy or fashionable, eager to pay their deference to the 'beautiful Duchess,' and a later memory is that which brings to our minds Charles Dickens and those celebrated performances of *Not so Bad as we Seem*, instituted by the novelist and Lord Lytton in aid of that still-born society the Guild of Literature.

Adjacent to Devonshire House—'over against,' as our forefathers would have said—stands, even more grimy and doleful, the town mansion of London's 'Lady Bountiful,' the Baroness Burdett-Coutts. Never, surely, was so bright, so beneficent a spirit sheltered in so unpromising a structure as this ugly corner house, from which Sir Francis Burdett was escorted, to become the last prisoner in the Tower of London. Nowadays, the building is associated with deeds of charity and benevolence of the noblest kind, and most passers are half induced to raise their hats in respect as they go by the end of Stratton Street.

We have now arrived at the most charming portion of Piccadilly. Here the aptly named Green Park commences, calling to mind the words of the poet who has sung the praises of this locality in those verses commencing:

Piccadilly! shops, palaces, bustle and breeze,
The whirling of wheels and the murmur of trees.

Nowhere in London, perhaps, is Nature seen in more delightful freshness than here. Trees and grass seem to wear a perennial emerald tint, due, perchance, to the fact that here was all marsh-land in those years long ago when, where St James's Palace now stands, a hospital for lepers reared its melancholy front.

Palmerston, 'Old Pam'—who does not know the house he inhabited, when, the ruler of the nation's destinies, his gifted spouse entertained such brilliant circles? It is a Club now, that square, solid stone block, with its brick screen and double entrance gates. Bright and gay with flowers are the windows, and through them one catches glimpses of the chambers where the gray old statesman revolved many momentous questions in that long head of his.

Near by, Hertford House shows its massive frontage to advantage. A fine building, severely classical with its Corinthian columns, yet a relief from the 'London mixture' of style which too often distinguishes our present houses. It belonged formerly to the Sir Richard Wallace whose loss Paris particularly, and the art world in general, are yet deploring; but he parted with it to one of the rich merchant princes.

The 'charming *bijou* residence' of the house-agent's circular is very much to the fore hereabouts. There is quite a line of these small, apparently inconvenient, and yet high-priced dwellings, regular bandboxes of houses, with a rear outlook on to a mews or something equally pleasant. We are here, too, in the region of 'Junior' clubs, one of which, the Junior Athe-

næum, inhabits Hope House, No. 116, a corner building, which has escaped elegance without being downright ugly. One may know it by the Hope arms over the windows, the shattered globe, and also by those panels of polished granite which gave rise to a faint witticism on the part of Dickens to the effect that the house 'looked as if its face had been scratched and then covered with strips of sticking-plaster.'

A few steps more bring us to Park Lane and Gloucester House, town residence of our illustrious Commander-in-chief. Very unpretentious for the home of the Queen's cousin, yet withal boasting as comfortable and picturesque an aspect towards the Park as any house in Piccadilly. Through the French windows, travellers outside the omnibus can catch a rapid sight of statuettes, a neat white bookcase well filled with bright volumes, a few pieces of choice French furniture—nothing approaching the palatial; but neat, tasteful, and orderly, like the home of any English gentleman.

Lord Byron was once a near neighbour to Gloucester House, though the building has disappeared, to be replaced by Sir Algernon Borthwick's stately mansion, outwardly as well as inwardly one of the most elegant in London. All that is left to remind us of Byron is the number 139. Here it was that this wild wayward spirit passed the later part of his brief, unhappy, ill-advised married life. Here, in the midst of sordid troubles which must have jarred with dreadful intensity on so sensitive a creature, happened to him that event which broke up his life, and, as he has said, 'sent him forth a wanderer'—the desertion, flight, or whatever it may be termed, of his wife. We shall probably never know the truth of that sad history. When, some years since, a justly respected hand injudiciously endeavoured to lift the dark curtain which charitably veils this part of Byron's life, the result was a storm of protest from all sides, from all classes, save perhaps the bigot and the ignorant who revelled in the besmirching of a noble name with a mire fouler and blacker than any which his own, alas! too patent indiscretions had created for passers-by to fling. It is well that such was the case. Let the 'dead past bury its dead;' and on the grave of his forgotten and forgiven imperfections, may the flowers bloom to furnish a never-fading wreath for the brow of one we must honour as one of the great poets of the nineteenth century.

We have now nearly arrived at the termination of our walk, for, passing the row of handsome stone buildings which comprise the Rothschild, the Antrobus, and other mansions, we reach Apsley House and Hyde Park Corner. What memories of the stern, gray Duke arise as one gazes at the plain, smoke-begrimed edifice! The windows on the Park side, obscured by shutters, remind us of the iron plates which the veteran hero of a hundred fights was fain to place between himself and the stones of a London mob. A strange little piece of history this, and a significant warning to soldiers, however great and gifted, to stick to warfare, which is their business, and leave politics, which are not, severely alone.

The arrangement of Hyde Park Corner is much improved since the arch at the end of Consti-

tution Hill was swung round, giving a fine open space, which reveals the grandiose block of Grosvenor Place to advantage, though it somewhat accentuates the formal ugliness of St George's Hospital. Decimus Burton's elegant arch, too, is better seen, especially since the authorities took the sensible step of restoring the stonework to something of its original whiteness. Up to 1825 there was a turnpike gate hereabouts; and in the near vicinity stood the 'Hercules Pillars,' the scene of some of Squire Western's immortal exploits when he came to town on that memorable expedition resulting in the discomfiture of Mr Blifl and the happiness of that amiable scapegrace Tom Jones.

Here we must bid adieu to Piccadilly. In our short journey we have met with many pleasant people, revived many pleasant recollections; yet they are but a tithe of the associations connected with this bright and busy thoroughfare, respecting which one may cordially endorse the opinion expressed in the verses from which we have already quoted:

Whatever my mood is, I love Piccadilly.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXV.—CAN HE REMEMBER?

It was past ten o'clock that Sunday evening when Elsie arrived home. Athelstan and George were waiting up for her. 'Again the mysterious appointment?' asked the former. 'Are we to know anything yet?'—Elsie shook her head.—'Not to-night? Very good. You look tired, Elsie.'

'I am tired, thank you. And—and I think I would rather not talk to-night. I will go to my own room.—Have patience, both of you, for a day or two longer. Believe me, everything is going well. The only reason why I cannot tell you what I have been doing is that it is so strange—so wonderful—that I have not been able even to shape it into words in my own mind.—What is to-day? The 1st of August.'

'Only eleven days yet—eleven long days,' said George, 'but also eleven short days.'

'I do not forget. Well—you may both of you sit down—go about your business—you need do nothing more. As for me, I think you will have to get on without me every evening this week. But be quite easy. The thing is done.' And with that, nodding and laughing, she ran out of the room.

'It is done,' repeated George. 'The thing is done. Which thing?'

'It is done,' repeated Athelstan. 'What is done? How was it done? Who did it? When was it done?'

'Since Elsie says it is done, I am bound to accept her assurance. Presumably, she has caught old Checkley at South Square, in the very act. Never mind; I am quite sure that Elsie knows what she says.'

In her own retreat Elsie sat down to consider.

If you think of it, she had a good deal to

consider. She had, in fact, a tremendous weapon, an eighty-ton Woolwich, in her possession; a thing which had to be handled so that when it was fired it should not produce a general massacre. All those who had maligned and spoken and thought evil of her brother and her lover should, she thought, be laid prostrate by the mere puff and whiff of the discharge. Checkley should fall backwards, and raise a bump at the back of his head as big as an egg. Sir Samuel and Hilda should be tumbled down in the most ignominious fashion, just as if they had no money at all. And her mother should be forced to cry out that she had been wrong and hasty.

She held in her own hands nothing less than the complete demolition of all this erection of suspicion and malignity. Nothing less. She could restore to her brother that which he had never lost, save in the eyes of his own people, who should have been the most jealous to preserve it. No greater service could be rendered to him. And she could clear from her lover's name whatever shreds and mists had been gathered round it by the industrious breath of Checkley—that humble Cloud Compeller. You see, we all have this much of Zeus in us, even in the compelling of Clouds: every man by the exercise of a little malignity, a little insinuation, and a few falsehoods, can raise quite a considerable mist about the head or the name or the figure or the reputation of any one. Women—some women, that is—are constantly engaged in this occupation; and after they have been at their work, it is sometimes hard for the brightest sunshine to melt those mists away.

To be able to clear away clouds is a great thing. Besides this, Elsie had found out what the rest had failed to find out—and by the simplest method. She had learned from the only person who knew at what hour she should be most likely to find the mysterious Edmund Gray, and she had then waited on the stairs until he came. No method more direct—yet nobody thought of it except herself. She had done it. As the result, there was no longer any mystery. The man who forged the first cheque: the man who wrote those letters and conducted their transfer: was, as they all thought at first, Edmund Gray. No other. And Edmund Gray was Edward Dering, one and the same person—and Edward Dering was a Madman, and this discovery it was which so profoundly impressed her. There were no confederates: there was no one wanted to intercept the post: no one had tampered with the safe: the Chief himself had received the letters and conducted the correspondence alternately as Edmund Gray himself, or Edmund Gray acting unconsciously for Edward Dering.

Perfectly impossible—Perfectly simple—Perfectly intelligible. As for the impossibility, a fact may remain when its impossibility is established. Elsie was not a psychologist or a student of the brain. She knew nothing about mental maladies. She only said after what she had seen and heard: 'The man is mad.'

Then she thought how she should best act. To establish the identity of Mr Dering and Edmund Gray must be done. It was the one thing necessary. Very well. That could easily be done, and in a simple way. She had only to march into his office at the head of a small

* Copyright 1892 in the United States of America by Harper & Brothers.

band of witnesses and say: 'You wanted us to find out Edmund Gray! I have found him. And thou art the man!'

He would deny it. He certainly knew nothing about it. Then she would call upon her witnesses. First, Athelstan's commissionaire, who declared that he should remember, even after eight years or eighty years, the gentleman who sent him to cash that cheque. 'Who is this man, commissionaire?'

'That is Mr Edmund Gray.'

Next the landlord of his chambers. 'Who is this man?'

'That is Mr Edmund Gray, my tenant for nine years.'

Then she would call the eminent Barrister, Mr Langhorne. 'Do you know this man?'

'He is my neighbour, Mr Edmund Gray.'

And Freddy Carstone the Coach.

'He is my neighbour, Mr Edmund Gray.'

And the laundress, and she would say: 'I have done for the gentleman for nine years. He's a very good gentleman, and generous—and his name is Mr Edmund Gray.'

And the people from the Hall—and they would make answer, with one consent: 'That is Mr Edmund Gray, our preacher and our teacher.'

And she herself would give her testimony: 'I have sat with you in your chambers. I have heard you lecture in your Hall, surrounded by these good people, and you are Edmund Gray.'

The thing was quite easy to do. She could bring forward all this evidence at once, and it would be unanswerable and convincing even to Sir Samuel.

Except for one thing which made it difficult.

The discovery would be a most dreadful—a most terrible—revelation to one who believed himself to be the most respectable solicitor in the whole of London; the most trustworthy; the clearest in mind; the keenest in vision; the coldest in judgment. He would learn without the least previous suspicion or preparation, or any softening of the blow, that for many years he had been—What? Is there any other word—any kinder word—any word less terrifying or less humiliating by which the news could be conveyed to him that he had been Mad—Mad—Mad? Heavens! what a word it is! How terrible to look at with its three little letters which mean so much. All the words that mean much are monosyllables: God—Love—Joy—Hate—Fear—Glad—Sad—Mad—Bad—Hell—Home—Wife—Child—House—Song—Feast—Wine—Kiss—everything—they are the oldest words, you see; they have been used from time immemorial by prehistoric man as well as by ourselves.

Mr Dering had to be told that he was Mad. Somehow or other, he must be told that. It seemed at first the only way out of the difficulty. How could this girl communicate the dreadful news to her guardian, who had always been to her considerate, and even affectionate? She shrank from the task. Then she thought she would hand it over to her brother Athelstan. But he was far more concerned about clearing up the hateful business than about softening the blow for Mr Dering. Or of communicating it to George. What should she do? Mr Dering was mad. Not mad all the time, but mad now and then, sometimes every day, sometimes with

intervals. This kind of madness, I believe, takes many forms—a fact which should make the strongest men tremble. Sometimes it lasts a long time before it is found out. Sometimes even it is never found out at all. Solicitors and doctors tell queer stories about it. For instance, that story—quite a common story—of an old gentleman of irreproachable reputation, a speaker and leader in religious circles, a man enormously respected by all classes, concerning whom not his bitterest enemy had a word of scandal—yet, after his death, things deplorable, things incredible, things to be suppressed at any cost, were brought to the knowledge of his lawyers. At certain times he went mad, you see. Then he forgot who he was: he forgot his reputation, his place in the world, and the awful penalties of being found out: he went down: he lived among people of the baser sort, and became an inferior man with another name, and died without ever knowing his own dreadful record. Another of whom I have heard was mad for fifteen years, yet the Chief of a great House, who all the time conducted the business with great ability. He was found out at last because he began to buy things. Once he sent home six grand pianos: another time he bought all the cricket bats that were in stock in a certain shop; and another time he bought all the hats that fitted him at all the hatters' shops within a circle whose centre was Piccadilly Circus and the radius a mile long. After this they gave him a cheerful companion, who took walks abroad with him, and he retired from active business.

Some philosophers maintain that we are all gone mad on certain points. In that case, if one does not know it or suspect it, and if our friends neither know nor suspect it, what does it matter? There are also, we all know, points on which some of us are mad, and everybody knows it. There is the man who believes that he is a great poet, and publishes volume after volume all at his own expense to prove it: there is the man—but he ought to be taken away and put on a treadmill—who writes letters to the papers on every conceivable subject with the day before yesterday's wisdom: there is the man who thinks he can paint—we all know plenty of men mad like unto these, and we are for the most part willing to tolerate them. Considerations, however, on the universality of the complaint fail to bring consolation to any except those who have it not. In the same way, nobody who dies of any disease is comforted with the thought of the rarity or the frequency of that disease; its interesting character has no charm for him. Nor is the man on his way to be hanged consoled by the reminder that thousands have trodden that flowery way before him. To Mr Dering, proud of his own intellect, self-sufficient and strong, the discovery of these things would certainly bring humiliation intolerable, perhaps—even—shame unto Death itself. How—oh! how could things be managed so as to spare him this pain?

Elsie's difficulties grew greater the more she pondered over them. It was past midnight when she closed the volume of thought and her eyes at the same moment.

In the morning, Athelstan kissed her gravely.

'Do you remember what you said last night, Elsie? You said that we could rest at peace because the thing was done.'

'Well, Athelstan, the words could only have one meaning, could they? I mean, if you want me to be more explicit, that the thing is actually done. My dear brother, I know all about it now. I know who signed that first cheque—who sent the commissionaire to the Bank, who received the notes—who placed them in the safe—who wrote about the transfers—who received the letters and carried on the whole business. I can place my hand upon him to-day, if necessary.'

'Without doubt? With proofs, ample proofs?'

'Without the least doubt—with a cloud of witnesses. My dear brother, do not doubt me. I have done it. Yet—for a reason—to spare one most deeply concerned—for the pity of it—if you knew—give me a few days—a week, perhaps, to find a way if I can. If I cannot, then the cruel truth must be told bluntly whatever happens.'

'Remember all the mischief, the old villain has done.'

'The old villain? Oh! you mean Checkley?'

'Of course; whom should I mean?'

'Nobody—nothing. Brother, if you bid me speak to-day, I will speak. No one has a better right to command. But if this—this person—were to die to-day, my proofs are so ample that there could be no doubt possible. Yes—even my mother—it is dreadful to say it—but she is so hard and so obstinate—even my mother would acknowledge that there is no doubt possible.'

Athelstan stooped and kissed her. 'Order it exactly as you please, my child. If I have waited eight long years, I can wait another week. Another week! Then I shall at last be able to speak of my people at home. I shall go back to California with belongings like other men. I shall be able to make friends; I can even, if it comes in my way, make love, Elsie. Do you think you understand quite what this means to me?'

He left her presently to go about his work.

In the corner of the room stood her easel with the portrait, the fancy portrait, of Mr Dering the Benevolent—Mr Dering the Optimist—Mr Dering as he might be with the same features and the least little change in their habitual setting.

Elsie stood before this picture, looking at it curiously.

'Yes,' she murmured, 'you are a dear, tender-hearted, kindly benevolent, simple old Thing. You believe in human nature: you think that everybody is longing for the Kingdom of Heaven. You think that everybody would be comfortable in it: that everybody longs for honesty. Before I altered you and improved your face, you were Justice without mercy: you were Law without leniency: you were Experience which knows that all men are wicked by choice when they get the chance: you had no soft place anywhere: you held that Society exists only for the preservation of Property. Oh! you are so much more lovable now, if you would only think so—if you only knew. You believe in men and women: that is a wonderful advance—and you have done well to change your old name to your new name. I think I should like you always to be Edmund Gray. But how am I to tell you? How, in the

name of wonder, am I to tell you that you are Edmund Gray? First of all, I must see you—I must break the thing gently—I must force you somehow to recollect, as soon as possible. I must make you somehow understand what has happened.'

She had promised to meet Mr Edmund Gray at his Chambers that evening at five. He showed his confidence in her by giving her a latchkey, so that she might let herself in if he happened not to be in the Chambers when she called, at five. She would try, then, to bring him back to himself. She pictured his amazement—his shame—at finding himself in strange rooms under another name, preaching wild doctrines. It would be too much for him. Better go to Mr Dering, the real Mr Dering, and try to move him, in his own office, to recollect what had happened. Because, you see, Elsie, unacquainted with these obscure forms of brain disease, imagined that she might by artful question and suggestion clear that clouded memory, and show the lawyer his double figuring as a Socialist.

She waited till the afternoon. She arrived at New Square about three, two hours before her engagement at Gray's Inn.

Mr. Dering received her with his usual kindness. He was austere but benignant.

'I tried to see you last night,' she said, untruthfully, because the words conveyed the impression that she had called upon him.

'No—no. I was—I suppose I was out. I went out'—His face clouded, and he stopped.

'Yes—you were saying, Mr Dering, that you went out.'

'Last night was Sunday, wasn't it? Yes; I went out.—Where did I go?' He drummed the table with his fingers irritably. 'Where did I go? Where?—What does it matter?'

'Nothing at all. Only it is strange that you should not remember.'

'I told you once before, Elsie,' he said, 'I suffer—I labour—under curious fits of forgetfulness. Now, at this moment, I—it really is absurd—I cannot remember where I was last night. I am an old man. It is the privilege of age to forget yesterday, and to remember fifty years ago.'

'I was talking last night to an old gentleman who said much the same. He has Chambers where he goes to write: he has a Lecture Hall—where he preaches to the people.'

Mr Dering looked at her in mild surprise. What did she mean? Elsie coloured.

'Of course,' she said, 'this has nothing to do with you.'

'How I spent the evening I know very well,' Mr Dering went on. 'Yet I forget. That is the trouble with me. My housekeeper will not give me dinner on Sunday evening, and on that day I go to my Club. I get there about five or six: I read the magazines till seven. Sometimes I drop off to sleep—we old fellows will drop off, you know—about seven I have dinner. After dinner I take my coffee, and read or talk if there is any one I know. About nine I walk home. That has been my custom for many years. Therefore, that is how I spent the evening of yesterday.—But, you see, I cannot remember it. Breakfast I remember, and the Church service afterwards. Luncheon I remember: getting home at ten I

remember. But the interval between I cannot remember.'

'Do you forget other things? Do you remember Saturday afternoon, for instance?'

'Yes—perfectly. I left the office about five. I walked straight home.—No—no—that isn't right. It was nearly eight when I got home, I remember. The dinner was spoiled.—No—I did not go straight home.'

'Perhaps you stayed here till past seven?'

'No—no. I remember looking at the clock as I put on my hat. It was half-past five when I went out—Five. What did I do between half-past five o'clock and eight? I forget. You see, my trouble, Elsie—I forget. Perhaps I went to the Club: perhaps I strolled about: perhaps I came back here. There are three hours to account for—and I have forgotten them all.'

DEEP MINING AT MANCHESTER.

THE various textile industries of Manchester are so extensive that they quite overshadow its doings in the world of mining, and the town is hardly looked upon as a mining centre at all. Nevertheless, the Manchester coal-field has been the scene of the greatest activity and advancement; difficulties have been encountered and overcome and depths have been reached which are not so much as thought of elsewhere in the kingdom. On the eastern side of Manchester the coal-field forms a half-basin, and the strata of the rocks lie inclined towards the city at an angle of ten to twenty degrees from the horizon, the direction of the line of greatest dip being pretty nearly coincident with the main roads leading from the various outlying towns, which on a map look like the spokes of a wheel. Hence it is that coal-seams which lie near the surface some ten or twelve miles from Manchester gradually attain a greater depth as you approach the city, though at intervals they are suddenly uplifted nearer to the surface by dislocations known as 'faults;' or it may be that faults intervene, throwing down the seams of coal, and causing them to lie at a depth greater than that due to the ordinary inclination of the strata.

In the spring of 1875 a number of gentlemen, headed by the late Earl of Stamford and Warrington, decided to sink two shafts at Audenshaw, a village five miles from the Manchester Cathedral, and on the 6th of March in that year the first sod of the Ashton Moss Colliery was cut. In the town of Ashton-under-Lyne, which is situated about a mile to the east of Audenshaw, coal-mining had been vigorously carried on for many years, and most of the beds of coal had been investigated. Among the seams most profitable to work there were two, known as the 'Great' and 'Roger' seams; and by calculations based on the operations of several old collieries, it was considered that these seams might be pierced by the Ashton Moss shafts at a depth of some seven or eight hundred yards. Below the 'Roger' seam there lies a bed of coal called, from its shiny appearance, the 'Black Mine,' and this seam had also been largely worked in

the neighbourhood. Its depth below the 'Roger' is about four hundred yards.

The initial difficulty encountered was a thick deposit of sand, gravel, and marl, covering the solid rocks, and nearly sixty yards in thickness. This surface deposit had previously been explored by boring, and was known to contain a considerable amount of water. The shafts—two are required by the Mines Regulation Acts—were intended to be circular in shape, and sixteen feet in diameter when finished. In order to provide for the difficulties in sinking through the sand, they were commenced with a diameter of twenty-four feet; and after the solid rocks had been reached, inner walls, resting on a bed of impervious rock, were built, reducing the shafts to the required dimensions. These walls contained a cavity into which Portland cement was run; holes were left open at the lower part, to allow free passage for water during the construction of the walls; and on their completion, these holes were plugged up, and the whole of the water found in the wet sand was kept out of the shafts. The rocks under the surface deposit proved to be true coal-measures, although marked on the Geological Ordnance maps as 'Permian' red sandstones.

The early sinking did not offer any matter of interest except that down to a depth of two hundred and fifty yards, feeders of water were constantly met with, necessitating expensive pumping machinery. Seams of coal were met from time to time varying from one inch to two feet in thickness; huge beds of beautiful stained sandstone were passed through; but there was no indication of the whereabouts of the 'Roger' seam.

Years went on, and at length it was decided to make an exploration by driving a heading in one of the seams of coal passed through, to try to discover how the ground lay around the shafts. All proved useless, and it appeared as though the coal-beds had become attenuated in the locality. Finally, in 1880 it was decided to put down a bore-hole, and accordingly operations were commenced with a 'diamond' boring-machine, starting at the bottom of the deeper of the shafts, which had then attained a depth of seven hundred yards. The diamond boring-machine is a very simple apparatus, consisting of a pipe which is made to revolve, and which is furnished with a cutting edge, the cutting arrangement being formed of a number of discoloured Cape diamonds. This pipe penetrates the ground very rapidly, and samples of the rocks are procured in the shape of cores left in the pipe, much in the same way that a cheesemonger dips his knife into the middle of a cheese and extracts a sample from the interior.

The bore-hole was commenced with a diameter of nine inches, and this was gradually reduced to about an inch and a quarter at the bottom, the diminution being rendered necessary by the introduction of iron casings from time to time to keep the hole open, so that the hole eventually assumed the form of a very long telescope. The total depth ultimately reached was a thousand and eighteen yards from the surface, which is very much deeper than that of any boring previously made in England, or than any likely to be made again for some time to come. At nine hundred yards a bed of coal six feet thick was

found, and at nine hundred and fifty yards another bed of four feet. In addition there were several smaller seams, the total number of beds of coal of all thicknesses passed through by sinking or boring being sixty-eight.

After this successful exploration, the shafts were sunk down to the workable seams. These beds on a closer acquaintance turned out to be not the 'Great' and 'Roger' Mines, but the 'Black Mine,' and a somewhat inferior bed of coal known as 'The Saltpetre' seam. As the 'Black' Mine lies below the 'Roger,' this discovery raised the problem of what had become of the latter. There could be little doubt of its actual existence, and its absence in the shaft was to be explained by the theory of a large fault which must have been passed through in sinking. The existence of the fault was proved beyond all doubt in May 1891. A heading started in the 'Saltpetre' Seam was driven right through the fault, and by a piece of wonderful luck the 'Roger' Mine was discovered on the eastern side of it. There can be no doubt that the 'Great' Mine lies about fifty yards above the 'Roger,' and that they may both be found on the western side of the fault at a depth of some four hundred and fifty yards.

This extraordinary feat of driving from one seam of coal to another four hundred yards geologically higher is what, in sporting language, would be termed a 'thousand-to-one chance.' To illustrate the position, let the reader imagine a building to be severed by a fracture, running from roof to cellar, not quite vertically, but leaning over to the left hand. On the right-hand side of the fracture let a portion of the building be supposed to have sunk down until its roof is below the level of the cellar of the other portion. Imagine that in the process of subsiding, the building has not gone down vertically, but along the line of fracture. Under these circumstances, the part which has gone down will lie to one side of the other part, and a perpendicular line might be drawn between the two portions of the severed building without passing through either of them. This is the condition of things usually met with in mining, although it does not often occur that shafts happen to be sunk through a fault so as to just miss the severed coal-seams. If, however, the fracture were to lean over towards the right hand, and the right-hand portion of the building were to subside along the line of fracture, it might be brought into the position of lying exactly under the remaining portion of the building, and a vertical line might be drawn through both portions, cutting bedrooms, ground-floor, cellars, &c., twice. This condition of things is known in geology as a 'reversed fault,' and is not often met with.

A sinking pit is usually kept going continuously, Sundays excepted, the workmen being employed in shifts of eight hours each; in a sixteen-foot pit there would be from twelve to sixteen men employed at once. The material is drawn out by means of an iron vessel called a 'hoppet,' which contains about a ton and a half of broken rock. It is not usual to employ any mechanical means of preventing the hoppet from swinging from side to side, but it has to be held still for a few minutes, so that the rope is exactly perpendicular before it is sent up the pit. At a

great depth, the slightest touch will send the hoppet across the pit; therefore, the operation of steadying is a delicate and most important one.

The only accident of a serious nature which occurred during the sinking at Ashton Moss was one caused by the hoppet being sent up while swinging slightly: the contractor was in it with one leg hanging over the side; the hoppet struck a beam placed across one side of the shaft, and broke the contractor's thigh.

It is almost always necessary to loosen the ground sunk through by means of some kind of explosive, gunpowder being generally employed in dry places, and dynamite or some such disagreeable substance when water is present. Three or four holes are bored and charged and fired at once, time fuses of different lengths being used, so that each shot may be distinctly heard, to make sure that all have gone off. Of course, all the men have to get out of the way when the shots are fired, and great care taken to keep everything in order with the engine and signals, so that the men whose duty it is to light the fuses may be safely and rapidly drawn out when that duty has been performed. Blasting is sometimes carried on by means of an electric current, but there are many objections to this method.

The sides of a shaft are protected by brickwork, which is put in during the course of the sinking from time to time, in lengths varying with the nature of the ground; each length is laid on a foundation consisting of an iron ring, and the ring itself rests on plugs driven into the solid rock.

Water is not often met with at great depths: at Ashton Moss there are continuous feeders down to two hundred and twenty yards, in all amounting to twelve thousand gallons per hour, weighing about five times as much as the coal raised. In extracting coal at these depths, the very greatest care has to be taken to prevent the weight of the overlying rocks destroying the underground works. Roof, sides, and floor are constantly moving, and the enormous thrusting power exerted by the weight of the rocks rapidly smashes timber and brickwork.

The natural temperature at the bottom of the Ashton Moss Mine is eighty-four degrees, being very much lower than the theoretical temperature calculated upon by the Royal Coal Commission. The barometer stands three inches higher than at the surface.

How far this venture has influenced the question of the duration of the British coal-fields, it is not easy to say. The limit of depth laid down by the Royal Coal Commission in 1871 was four thousand feet, and this limit was fixed largely from the temperature calculated to obtain at that depth. It is well known that temperatures at the same depth vary largely at different places. Heat escapes along the lines of stratification, and where the stratification lends itself—as at Ashton Moss—to a ready escape, the temperature is much lower than at a place where the stratification is flat or otherwise unsuitable to the easy emission of heat. There seems no reason why the limit of four thousand feet should not be passed at Ashton Moss, leaving out the question of cost. Sinking at nine hundred yards deep presents to skilful men no greater difficulties than at two hundred

yards. We have certainly not reached the limit of strength in ropes and winding power, and when the pinch of scarcity comes, the difficulty of cost will disappear with the enhancement of prices.

THE BELLS OF LINLAVEN.

BY JOHN RUSSELL.

IN FIVE CHAPTERS.

CHAPTER I.—THE VOICE ON THE FELL.

THE way is long when the foot is weary ; and that old man, with white locks tossed and dishevelled, will have a hard fight with the strong west wind ere he gain the summit of Brathrig Fell. He pulls his cap closer down over his brow, and struggles on, with head bent forward to the gale. His step is slow and uncertain, and he frequently pauses to take breath, turning the while his back to the wind to let the fierce gust pass. One hand holds the staff with which he props his fainting limbs ; the other clutches the fastenings of a small valise or knapsack, brown and much worn, which he carries slung over his shoulder.

The man certainly looks old, yet his feebleness would almost seem due less to age than to illness. For as he gains the shelter of the pine-wood that skirts the brow of the hill, and sits down by the wayside to rest, there is a hectic flush on his cheek, a quick coming and going of the breath, as if some spasm of agony, mental or physical, were about to seize upon and destroy him. His lips move tremulously, like those of one speaking in pain, but a half-stifled groan is all that is audible.

It was evening, and the mingled gloom and glory of the red October sunset fired the western sky. The great hills of Westmoreland and Cumberland rose up huge and black against that burning background of light, the smooth round crest of Helvellyn contrasting with the sharper ridges of Skiddaw and Saddleback. Dense masses of black cloud swept along the nearer sky, or lay in the far distance like bars of darkness across the western flame. A misty dimness was creeping up into the valleys on the farther side of the Fell, showing like a thin white mist against the purple shadows of the hills. And away down there to the left, glimpses might be had through the trees of the glittering surface of a wind-swept lake, giving back the colours of the western sky in waves of slowly-fading brightness.

The light in the west gradually died down from fiery red to soft amber, and ere long from amber to a cold frosty gray. Yet still the winds blew, and roared among the great pines above upon the hill. Down in its wild ravine, Brathrig Beck sent its hurrying waters crashing from cataract and linn, making, with the creaking and groaning of the trees, a gloomy confused music as of Dis. Through it all, the old man sat silent, introspective, self-absorbed. He was heedless

alike of sunset hues, of driving cloud-rack, of the rush of winds and waters. There was a fierce stormy beauty in the scene around him, but his eye marked it not. Nature may deliver her message to the pensive-souled, the love-lorn, the calm thinker of deep things, but her still small voice cannot reach the heart that is torn by compunction and remorse. For so this old man's heart seemed to be. He, with his weak, melancholy eyes, and sad introspective vision, heard another voice within him than that of Nature, and the half-unconscious gaze beneath his drooping eyelids showed that his heart was like his eyes, and these were far away.

'Ah !' said he, as if speaking within himself, 'be thou ever so fleet o' foot, the vengeance o' God is fleet.'

And then, suddenly roused by the sound of his own voice, he looked up, and, conscious that the twilight was visibly deepening around him, started to his feet with a quick nervous motion, and once more continued his ascent.

The narrow hill-road led zigzag fashion along the ridge towards the higher ground, and was in some parts smooth and easy, in others rugged and uneven. For long he toiled wearily on, making little headway against the masterful gale, and with more and more frequent pauses for rest. Now and again, as some gust more fierce than its predecessors caught him, he was fain to cling to the grassy bank on his right, like a man who on shipboard, when the vessel heels suddenly to the wind, grasps eagerly whatever support is within reach. Away down on the left, the shimmering lake was coming more fully into sight, but the opalescent brightness of the sunset was no longer upon it, and its aspect, cold and leaden, was gloomy and depressing.

At that moment there came up on the wind the faint and distant clangour of bells. It was the hour of curfew, rung out from the tall square tower of Linlaven Church, outlined, with its surrounding trees, against the gray background of the lake. It did not seem at first as if the solitary wayfarer heard the bells. But as the wind brought towards him, now and then, a fuller and deeper swell of sound, he would pause for a moment and listen. He was like a man in a dream, not quite sure whether what he heard was reality or not.

At last the bells ceased ; but the old man still pressed wearily on—on into the gathering darkness ; till presently his waning strength failed him altogether, and he sank down by the wayside. A faint groan escaped his lips : no more. The night closed around him ; dim stars peeped glimmering through the torn rack of the sky ; no voice or footstep of living thing broke the solitude : he lay there, alone, beneath the darkness, with the winds and the clouds and the falling waters.

The Rev. Francis Norham, the aged Vicar of Linlaven, was sitting that same evening by his

study window, looking out upon the gathering storm, watching apparently the effect of the swift wind upon the trees that surrounded his home. There had been a touch of frost a few days before, and now, as blast after blast struck the swaying boughs, the sere and yellow foliage was driven off in showers, flying thick as snow-flakes across the garden, and across the churchyard, in great eddying whirls. The slates upon the roof rattled in sharp dissonance; and now and again the walls of the house shook as some neglected door was banged to by the wind. Things were evidently lively outside. The Vicar loved his garden and his flowers; and as he saw the tall chrysanthemums, staked along the side-walks, bending to breakage in the windy air, he may have thought sadly for a moment that much of their autumn glory would be shorn away, and not a little of his gardening labour lost.

It is just possible, however, that his thoughts were otherwise; for when the curfew bell rang out, he started to his feet and looked at his watch. Was it really so late?

'Wilfrid should have been home before now,' he said. 'If he is not across Brathrig Fell before darkness sets in, he will have an awkward ride of it.'

And as he spoke, he walked to his writing-table, and struck a small hand-bell. Presently a servant entered with a lighted lamp, which she placed on the table.

'Has Mr Wilfrid not returned, Maria?'

'No, sir.'

'Then would you say to Mrs George that when she has seen the children to bed, she might come here.'

'Yes, sir,' replied the servant, who, after drawing the blinds, closing the shutters, and extending the thick curtains across the windows, left the room.

The one lamp, with its heavy shade, lit the large library but feebly, although it shone on the writing-table with sufficient brilliancy. The Vicar was slightly distrait to-night. He did not sit down, but walked to and fro in a somewhat restless and anxious fashion. The wind without still roared among the trees, but he did not appear to heed it now.

After a time he drew a bunch of keys from his pocket, opened a drawer in his writing-table, and took therefrom a small packet of letters slightly yellowed with age. Selecting one, he replaced the others, and sat down in his study chair, with the light of the lamp full upon him. Opening the sheet of paper, which had been addressed to himself, he began to read it over. It was dated December 21, 1853, and ran thus:

DEAR FRANK—I am afraid you will think I have got into a sorry scrape. It was bad enough for me to break with my father on the question of my profession in life, but I do not know how much worse it will be for him—or how much more perplexing for you, who have always stood by me—when it is known that I have married without his knowledge or consent. But such the fact is. I see now, what you have often told me, that when a young man breaks, as I did, with his natural and accustomed surroundings, he may, instead of conquering the new and

unexperienced surroundings, be conquered by them. I need not argue the point now. It is enough that I am married. Nor do I for a moment regret it.

My marriage took place nearly a year ago, but, not to aggravate my father beyond endurance, I have hitherto kept it a secret from you all. Circumstances, however, have so come about that I do not think it desirable to keep the matter a secret any longer. A month ago, a little girl was born to us, and justice both to the mother and the child demands that I should make my marriage known to my father. I have therefore written to him, informing him of what he will no doubt regard as but an additional exhibition of my headstrong folly.

My wife is a good and beautiful woman. Her name is Esther Hales, and she is the daughter of a dissenting minister. I have boarded with her mother—who is a widow—since I came to this town; and Esther, who is well educated, was for a time a day-governess. In manners and culture she is a lady; but as her pedigree is not so long-preserved as that of the Norhams, I am afraid my father will not regard her as being entitled to that distinction. Will you, therefore, like a good fellow, when you get this, go over to the Hall and see my father, and try to calm him down a little. I know he will be ever so wild when he gets the news I send him; but, after all, he is my father, and I am his son. You know, Frank, how much he and I loved each other until I tried to strike out a course in the world for myself, and how much the subsequent estrangement has cost the feelings of both of us. Things will, I trust, come right between us by-and-by.

In the meantime, I do not—for reasons which are not quite pleasant to me—wish you to answer this letter, and therefore do not send you my present address. I had yours of a month ago forwarded to me by a friend from my old address; but you must not use that address any more, as it might be attended with some risk to me. I cannot at present explain further; but you will understand. When fortune favours me with a more propitious gale, I will write you again.

A. N.

This letter was, as we have said, addressed to the man who was now for the twentieth time reading it, and the initials appended to it were those of Arthur Norham, the elder of the two sons of Squire Norham of Brathrig Hall.

The estate of Brathrig was a large one, as far as number of acres went; but when these acres are in great part composed of dry upland fells, mountain peaks, and stretches of picturesque water, the results in the shape of rent are not quite so imposing. The estate, moreover, was—as often happens in old family possessions—not much the richer by the operations of a long line of preceding Squires; and the holders of the mortgages were believed to have a greater personal interest in the rent-roll than even the Squire himself. Nevertheless, he hunted and shot, and went to Quarter Sessions, and gave dinners to his county neighbours, much as was done by other Squires, and managed, year in and year out, to pull through. He had married a lady whose family was of precisely the same antiquity as

his own, both counting back to the inevitable Conqueror, and beyond that to Charlemagne; and three children had been born to them—two sons and a daughter, the latter being the youngest.

It so happens in many cases that children as they grow up do not exhibit either the qualities or defects of their parents. And in Squire Norham's instance this was so as regarded both of his sons. The elder, Arthur, had as a boy manifested a most unaristocratic taste for mechanical operations; so much so, that if on any occasion he did not appear at the luncheon hour, he was to be found either in the carpenter's or the blacksmith's workshop—the latter most frequently. As he grew out of his boyhood's years, this passion made itself still more apparent; and when, after his second year at Oxford, he returned home, and announced what he proposed to follow as his future career, the first breach between himself and his father occurred. Arthur's declaration was no less than this, that he did not intend to return to Oxford, but that he wished instead to enter himself for the profession of a mining engineer.

It was a great shock to the Squire. It almost took his breath away. That a young man descended from the knights who came thither with William the Norman, should take to so mean a profession, was unheard of. Business of any kind was mean in the eyes of the Squire, whose views of life were based severely on aristocratic and hereditary principles. His son might go into the army or navy if he chose; but to speak of any other form of profession was preposterous. Army and navy apart, the right thing for a young Squire to do was to prolong the sports and pleasures of boyhood into the remainder of his natural life, varied perhaps by an occasional attendance at Quarter Sessions; or possibly if he developed brains enough, by finding for himself a seat in Parliament. Anything else was little short of absolute madness.

He could scarcely believe that he had heard aright. 'Arthur,' he at length said, 'who has put this preposterous notion into your head?'

'No one in particular, father. You know I always had a taste for working with tools and machinery; and since I went to the university, I have been reading, and thinking about things, and keeping my eyes about me. You have often told me that the family property was much encumbered, and I do not think we shall ever be able to relieve it by my following upon the old lines. I am not strong in classics, and I do not see that any further knowledge of Latin and Greek on my part will ever help the estate. There are valuable minerals upon it, if we had the money to secure them; and I have formed the idea that, if I could qualify myself as a professional engineer, I might be able, with the little money we have, to make an attempt to work those minerals.'

It was a sensible and manly proposal; but the father could not see it. If the minerals were to be worked, surely there were sufficient men to be got for the purpose.

'But don't you see, father, that if I had a technical knowledge of the operations required, and of the minerals to be sought for, the knowledge would be worth money to us, and we should

not then be dependent upon the many mining adventurers upon whom gold has hitherto been simply thrown away.'

This last observation was somewhat unwise, or rather impolitic, on the part of Arthur; for it called up some unpleasant reflections in the Squire's mind, and did not improve his temper. The interview ended by the Squire informing Arthur that he must go back to Oxford as before.

Arthur was a headstrong youth; that was not to be denied. What he had set his mind upon, he would carry out, if he possibly could. By a legacy from a distant relative, he had something like two hundred pounds a year in his own right, and he thought that, with this, he could manage to qualify himself for the profession at which he aimed. Hence, without saying anything more to his father on the subject, he left home one morning secretly, and nothing further was known of him till the Squire received a letter in which Arthur told him that he had entered himself as a pupil to a mining engineer in Manchester.

His father received the intelligence as was to be expected. He stormed, and stamped, and denounced the insane folly of his son. Nor need we altogether withhold our sympathy from the Squire in this emergency. A man cannot change his *principles* and instincts as he changes his clothes; he cannot divest himself of life-long habits as a snake creeps out of its slough, and start afresh with a brand-new set. That the Squire, according to his lights, should regard his son's conduct as monstrous, was perhaps, after all, only natural.

At the first, his rage took the form of a threat to disinherit the young man; and possibly not even the persuasions of Mr Brookes, the family lawyer, would have been successful in withholding him from executing his purpose had the character of his second son been quite satisfactory.

But the character of James Norham—or Jim, as his associates called him—was very far from being satisfactory. Unlike his brother, he was so far from disregarding the sports with which the country Squires and their sons filled up a portion of their time, that he could have filled up his whole time with them. Guns, and horses, and dogs were his unflinching solace during such hours as he did not spend in the parlour of the *Three Pigeons*—and he spent a great many hours there. Nor were his companions of the most select order. Jim would sit down and tattle with any groom or stableman in the countryside, and was constantly making bets which he was unable to pay, much to the detriment of his father's income. At length, by the influence of friends, a commission was got for him in the army, and thus for a time the district was happily rid of his presence.

So the years passed, until that letter came to the Squire in which Arthur announced to him his marriage. The father declared at once what he should do. By a former will he had left the estate largely at the disposal of his wife, should she outlive him, and Arthur's share in it was only to depend upon certain contingencies. Now he had resolved to disinherit him, and would at once ride to town for that purpose.

He gave orders that the groom should bring round Black Prince immediately.

The groom, when he appeared with the horse, suggested that his master should ride another, as he had not been out much for some days. 'Your honour knows his temper,' he said, 'and this morning he is very fresh.'

'No,' replied the impatient and angry Squire; 'I must have him—the others are too slow for my errand.'

He proceeded to mount; but it was not till after a bit of a fight between horse and rider that Black Prince yielded to rein and spur. At length, however, he started off, and went tearing down the avenue at a furious pace.

The groom stood for a moment and watched them, dubiously. He had not failed to observe that both horse and rider were in a bad state of temper; and, as they disappeared round a bend of the road, a thought seemed to strike him. Hurrying back to the stables, he quickly led out and saddled another horse, which he at once mounted and rode off after his master.

At the entrance lodge the gates were open; and through these he passed rapidly, after having informed himself in which direction the Squire had ridden. For a couple of miles he never once got sight of him; but at length he did. The Squire was at a point where two roads forked off, and Black Prince was evidently refusing to take the one the Squire wished. A stiff battle was raging between the two, the horse lashing out and rearing. Just as the groom approached, the animal reared up and fell over—his rider underneath. When the servant dismounted to assist the Squire, it was to find him stone dead.

That same morning, the Vicar, having also received Arthur Norham's letter, had ridden over to Brathrig Hall, as the young man requested, in the hope of reconciling the Squire to the new situation. But he arrived too late. He was but in time to see the Squire's servants, with mournful faces, bearing the dead body of their master into the hall. The widow and her daughter were distracted with grief; and the Vicar soon found that he had more responsible duties to perform, and more solemn tasks to undertake, than were laid upon him by his friend Arthur's letter.

The Squire's death happened two days before Christmas; and what rendered this more remarkable was the fact—ascertained after long, and, for a time, baffled inquiries—that Arthur Norham had left his home on the day following that on which he had written to his father and the Vicar, and no trace of him had since been found. On the one day the son had disappeared; on the following the Squire had met his death. The dead Squire was laid with his ancestors in the chancel of Linlaven Church; but of Arthur—from that day to this not a word had ever been heard.

The Vicar sat this evening—the storm still roaring without—with the open letter in his hand, musing on the sad history and mystery which that letter had awakened once more in his mind. It was now nearly thirty years since he had first received and read it; but the effects which it brought about were operating to this

day. As he thought of all this, he heard the tramp of a horse outside, and presently the door of his room opened and a lady entered.

'Grandpapa,' she said, with an anxious look, 'that must be Wilfrid. Oh, how I wonder if he has a letter for me!'

CREMATION.

BY S. BARING-GOULD.

It would certainly be a singular fact, should what appears to be a fact prove to be one—that Cremation was a means of disposal of the dead peculiar to that great Aryan or Indo-Germanic branch of the human family to which we belong. Nor is it a less singular fact—and fact this is beyond dispute—that cremation has never been more than a fashion among those peoples who have adopted it, that has never wholly overmastered and driven out the more ancient and more generally customary usage of interment.

In the Bible, cremation is spoken of as a sharpening of the punishment of death, as something conveying disgrace with it; and the only exceptions were those of Saul and his sons—when the bodies were burnt probably because it was not possible in any other way to convey their bones from the land of the Philistines to that of their fathers; and secondly, in cases of pestilence, when it was done in the hope of thereby arresting the spread of contagion.

As far as we have any evidence from history, the burning of the dead was confined to the Indo-Germanic stock, and was not universally practised even among it. Of the nations of antiquity, the Greeks are those of whom we know most, and the poetical descriptions in Homer of the burning of the bodies of Patroclus and of Achilles have given occasion to the supposition that cremation was the usual method among the Greeks of disposing of their dead. That this was not the case, however, has been revealed by the discoveries of Dr Schliemann at Mycenæ, where he has found bodies buried of those who were contemporaries of the heroes engaged in the Trojan war, if the interments be not in some cases those of some of these very heroes themselves. In later times, moreover, cremation was by no means universal among the Greeks; and owing to the expense of a funeral pyre, the interment of the dead was usual among those of moderate means and the poor. Cremation was a funeral luxury.

Since the fourth century before Christ, an idea prevailed that the dead required a sort of purification, and that this purification could be effected by fire. It was the same with the Etruscans and Romans. Pliny distinctly affirms that cremation was not the institution of the ancients, but that it arose much as in the case of Saul and his sons, through death far from home, and the impossibility of bringing home to be buried with their fathers those who had fallen in foreign wars in any other way than in ashes. Some of the noble Roman families refused to adopt the fashion when it spread. Conspicuous among these was the great Cornelian gens; and Sulla was the first member of this family who was burned, and he only because, having cast

out of their sepulchre and scattered the remains of his great adversary Marius, he feared lest his own body should be subjected to indignities, and consequently ordered that it should be cremated.

The custom of burning the dead had, however, come in long before this, as we may see from a law of the Twelve Tables that forbade the interment or the burning of a body within the precincts of the city. This law was broken by the populace at the funeral of Julius Cæsar, when they tumultuously seized on the corpse, collected benches and stools, and burnt it in the Forum.

Among the ancient Germans, according to Tacitus, cremation was customary, and the Anglo-Saxons brought the usage over into Britain. In *Beowulf*, an Anglo-Saxon epic of the eighth century, there is a description of the burning of the dead.

In Scandinavia, both kinds of burial were in usage: the 'Brunaöld,' or age of burning of the dead; and the 'Haugaöld,' or age of interment of the dead. Baldur and Brunhild were both burnt on funeral pyres; but, on the other hand, numerous notices in the Sagas relate to the burial of the corpses in mounds. Moreover, the cairns and tumuli tell the same story—that both methods of disposing of the dead were in use. Some old chiefs were laid in their ships and mounds heaped over them; and some were first consumed to ashes.

Among the Celts, another great branch of the Indo-Germanic family, according to both Diodorus and Cæsar, the burning of the dead was customary; and Cæsar relates how that with the deceased were burned whatever he had most affected, as his horses and dogs, and formerly clients and slaves. It was the same with the Slavonic peoples. St Boniface tells how that the Wends at the beginning of the eighth century burned their dead, and how that wives committed suicide so as to be burned along with their deceased husbands. And Nestor, the historian of the Russians at the beginning of the twelfth century, says the same of those concerning whom he writes.

The great branch of the Aryan stock which turned eastward in like manner carried cremation with it, but not as a sole and exclusive usage, for it never took its place among the Parsees, who would regard it as a desecration of the pure and sacred flame; on the other hand, in India the practice of suttee became customary among the high-caste Brahmins: the wife was burnt along with the body of her husband. The usage of burning the dead is not, however, by any means universal. Corpses are cast into the sacred waters of the Ganges; and the burning of the dead is only of general practice in the valleys of the Himalaya among some of the savage or half-savage tribes. As concerns the Semitic races, cremation was never a prevalent usage. We see with what repugnance it was regarded by the Hebrews, whose highest conception of honour shown to the dead was embalming them, a conception probably derived from the Egyptians.

In Babylonia are the burial-places of the dead, who had not been subjected to fire, but, curiously enough, there has been discovered of recent years a necropolis of burnt bodies. Whether these are

the remains of foreigners of the Aryan race, settled in Babylonia, preserving their peculiar usage, or whether they represent the destruction of bodies by fire after a plague—an exceptional case in which alone cremation was endured—cannot be told.

The countless barrows and cairns dispersed over the downs and hills of Scotland, England, and Ireland tell of both cremation and inhumation. Not only so, but of both having been in use at one and the same time. In the same barrow, at the same interment, one corpse was reduced to ashes, the other not. Dr Anderson, in his *Scotland in Pagan Times*, says: 'With regard to the burial customs (in the Bronze Age), it is apparent that we have no evidence sufficient to separate the custom of cremation from the custom of burying the body unburnt. We have frequently found the burnt interments and the interments unburnt in close juxtaposition in the same group of burials, and in point of fact the two modes of burial are occasionally present in the same cairn.'

Canon Greenwell of Durham, who has made exhaustive and scientific exploration of the barrows on the Yorkshire wolds, gives precisely similar testimony. In his *British Barrows* he mentions several instances in which indubitably the two methods of burial have been practised simultaneously. He says: 'I have found many cases where a burnt and an unburnt body have been laid in the grave most unquestionably at the same time. It is difficult to say why one was burnt, while the other was interred without having undergone the process of cremation. I have thought we have in the burnt bodies those of wives and slaves killed at the time of the funeral of the man; still that is mere conjecture, and men are found burnt and laid alongside of unburnt women, if we may judge of the sex by the accompanying implements or weapons, which seems a fair deduction; but I am certain that inhumation and cremation were practised not only at the same time, but for interments made the same day.'

In one very curious instance brought under the writer's notice at St Sernin in Corrèze, a cairn contained a woman, one half of her unconsumed, the other half burned and placed in an urn.

It has been a matter of debate among antiquaries and ethnologists as to the race or races that erected the cairns and barrows and left their inhumated and incinerated remains in them. It has been conjectured that some belong to a pure Celtic race, others to the swarthy Ivernian stock which first occupied the British Isles, and is possibly of Turanian origin, represented now by the Basques, Lapps, and Finns. But as far as is known, incineration was a speciality of the Aryan stock, though never a permanent practice, one that appeared and disappeared, that prevailed, and was then abandoned by the branches of that great stock. And this fact, if fact it be—and it seems to be well established—goes far to make us believe that the barrow and cairn builders, at all events such as burnt their dead, were of the same Aryan race as ourselves.

But again, the fact, and fact it is, that at one and the same time, and in one and the same interment, both fashions of burial are found, is probably explained by the conduct of the mighty

men who rescued the bodies of Saul and his sons from the Philistines. When a chief had died at a distance from home, then he was incinerated, so that his body might be brought to the same necropolis where were buried the unburnt dead of his family or tribe. We find this explanation of the burning of the dead in the first book of Samuel, and also in Pliny, as explaining the introduction of the fashion among the Romans. Moreover, in some interments—though of an earlier age—the bones are found to be scratched, as though the flesh had been removed from them before burial. These were probably cases of dead warriors at a distance from their family resting-places, who were thus treated so as to enable their remains to be conveyed home.

IN THE EVENING OF LIFE.

THE sunshine lay so hot upon the old garden outside the grateful shadow of the trees, that there was no stir of life. The grass looked almost dead, and a film of shimmering heat hung over it that seemed to scorch the eyeballs like a blast of hot air from a furnace of molten metal. It was mid-day—and mid-day in July. Scarcely a sound made the silence conscious; once only a big lumbering bee hummed across the open, but did not pause to levy contribution upon the heliotrope, which seemed the predominating savour in the strangely mingled scent that filled the place.

The garden was so old that it had an air almost of decrepitude, that was peculiarly delightful. It looked as though it might have been precisely as it was any summer these fifty years. The plants had luxuriated in an unpruned freedom that was their symmetrical death. The geraniums and gillyflowers, never among the aristocracy of plants, had degenerated to mere vagabondage; a carpet bed, that once had shown an even and close-set face of many colours to the sun, now survived only in a ragged and forlorn decay, like a beauty who has outlived her charms, yet still persists in revealing the rags and tatters of her once bright youth. The roses, too, had cast aside all notion of decorum, and wasted their strength in a prodigality of blossom, sweet indeed, but frail and heartless.

The garden had once been trim; the beds were cut into curious shapes, dividing the grass into numberless intricacies, and almost wearying the eye with their multiplicity of varying line. On the right, looking towards the south, stood some fine elms and a few copper beeches; while set, as it seemed, in the very centre of the place was a huge Portugal laurel, laden with its creamy flower-cones; and encircling this, a seat. All round the garden was a high wall, the sunny sides of which were covered with plum and pear and peach and nectarine; these seemed to have received more attention than their kindred of the beds. If you passed between the two tallest of the elms, you came to a little wicket gate, and there your eyes and nostrils at once would be assailed with a strange delight of scent and colour. Beyond the gate there lay an orchard, so old, so quiet, so reminiscent of old memories, that, under the shade of its gnarled and twisted branches, you would have forgotten the world

completely, or thought of it only as of a tale that is told. The red-cheeked, sun-baked apples diffused a subtle odour upon the air, and seemed to glint a homely welcome from their glossy skins. The trees were gray with lichen, and the long grass reached high up about their ancient trunks, as though the ripe and mature growth of a single spring and summer would claim protection from the still vigorous bearers of the wet and sunshine of many years. The thick growth was borne down in places by the weight of fallen fruit, as yet ungathered. The orchard was bounded on the further side by a tall nut-hedge; and beneath this, again, there was a rustic bench. The shadow of the trees lay still upon the grass, not a branch or a leaf stirring, and the light and shadow made a luxurious carpet like a black and gold brocade.

The house to which these ancient grounds belonged was as old and quiet as they. It stood, blinking in the light, with open casements and drawn blinds. It was a low building of gray stone, with heavy mullioned windows and queer gables; the overhanging eaves were thickly plastered on the under-side with swallows' nests; there were so many that the eye wearied in counting them before the tale was complete. At either side of the hall door roses climbed, which trespassed upon the wall-space of some jessamines and mingled their pink-tipped blossoms with their companions' yellow stars. About the house, too, there was no sign of life. Everything was quiet, and mellow, and world-proof; even the pigeons on the roof, whose burnished throats gleamed in the light, were as still and drowsy as the rest.

The hours glided slowly away, and as the declining sun made the elms cast longer shadows, the birds found voice again and called to one another through the cooling air. At about six o'clock the door opened, and an old gentleman stepped out and walked towards the Portugal laurel with a slow and measured pace. Having reached the seat, he sat down upon it, disposing himself comfortably with his back against the tree and his face towards the door, which he had left open. He was of a tall and stately bearing, half through his seventh decade, and with a simple, benevolent, and open countenance. His dress was of black velvet, the quality very fine, and at his breast and wrists were falls of rich amber-coloured lace. His stockings, too, were black; and his shoes were fastened by old paste buckles, framed in gold. The point of a black cane rested on the ground beside him; and his left hand, very delicate and finely jewelled, lay upon its golden knob. His look wandered round the garden slowly and contentedly, not with any sign of disquiet; but it always paused for a little longer when it returned to the open door, as though, without perturbation, but still with certainty, he expected some one to pass through it as he had done, and take the same way towards the seat on which he was sitting.

Under the shade of the dark-green leaves and blossoms, the air was cool and balmy; a black-bird up above him gave an occasional contented chuckle; and a wren, somewhere near, was piping its little song with all the strength of its small throat.

The old gentleman had sat thus for some ten

minutes, when he put his right hand into his pocket, drew out a snuff-box, transferred it to his left hand, opened it, and took a pinch with an appearance of calm enjoyment. The snuff-box was of gold, beautifully chased, and on the cover was a miniature. It represented a girl of perhaps twenty years of age, with long golden curls falling round a face so young and fresh, that, as the old gentleman looked at it after closing the box, and before returning it to his pocket, the sight brought a pleasant smile to his face, that seemed to take ten years from his age.

'She has altered very little,' he said, half aloud; 'the hair is gray; but the fashion of my wig has changed as well.'

He slipped the box into his pocket and resumed his former attitude.

As his eye reached the open door again, a new light flashed into his glance; for there came forth a lady as stately as himself, though not so tall, dressed in a black silk gown with trimmings of old gold. The old gentleman rose and walked towards her; half-way between the laurel and the door they met. He took off his hat with a low bow, and offered her his arm, which she accepted with an inclination as courtly as his own. He led her to the seat, and they sat down there, side by side. They were like a companion pair of antique drawings; even the colour of their dresses harmonised, like two notes making a perfect chord.

'It is forty years,' said the old gentleman, 'since we sat alone together in this garden. You may, perhaps, remember?'

Across the old lady's face there passed the suggestion of a blush; it was so slight that it seemed but the memory of one. 'I remember well,' she said.

'It was good of you,' he said, with an inclination of the head, 'to remain another day after my guests had gone; perhaps it was not right of me to ask you.'

'After the very pleasant time that I have spent here—and remembering our old friendship—I could not very well refuse so small a request; nor did I wish to refuse it,' she answered.

'You may recollect,' he said, tapping the knob of his stick with his finger, 'that I asked a greater favour of you forty years ago—if I offend you, pray bid me be silent—and now that so many, so very many, years have passed, can there be any wrong in asking why you wrote this letter?'

He took from his pocket, first his snuff-box, which he laid upon his knee, and then a leather case, from which he drew a letter, yellow at the edges, but untorn, as though preserved with infinite care. This he unfolded, and handed to his companion.

'Before I read this,' she said, 'will you permit me to look more closely at your snuff-box?'

'Madam,' he answered, 'you will do me honour—by looking at yourself.' He handed the box to her with another inclination.

As the old lady gazed at that fresh picture of her vanished youth, old memories seemed to stir within her, and the hand that held the box trembled, and her eyes saw it through a kindly mist. She returned it to him; he opened it and took another pinch; his hand, too, must have

been unsteady, for a little powder fell upon his ruffles. Having returned the box, she read the letter, which ran as follows:

'I am sorry that I cannot be as you desire; there are reasons which I cannot explain to prevent it. I trust to your honour to let no word escape you of what has passed, and to make no effort to see me again. Farewell.'

She held the letter between her fingers for full five minutes, then refolded it and handed it back.

'My hand,' she then said slowly, 'wrote that letter, but my heart did not. After so many years, and as you desire to know, I may tell the truth concerning it. May I trouble you with a few words of family history?'

'Anything, Madam, relating to yourself cannot but be pleasant to me to hear.'

'You are courteous, as ever.—Well, then, when I was here, in this house, forty years ago, as your father's guest, I was about twenty-two: yes—that is right—this year I shall be sixty-three.'

'And I,' said the old gentleman, 'sixty-six.—Excuse me; pray go on.'

'I met in this house a gentleman, young, frank, honourable, who, for some reason, chose to think he loved me.'

'Madam, he not only thought— But again, forgive me.'

'Who loved me, then. I, too, felt that counter-attraction towards him which—which a young girl may be permitted to feel under such circumstances. Just before the end of my visit, we chanced to meet alone under the shade of a large Portugal laurel in a well-trimmed garden.' Here the speaker looked round upon the unpruned beds, as though trying to recall a recollection.

The old gentleman said nothing; his head was bent slightly forward, his left hand still resting upon his stick.

'Certain words were spoken—true words, no doubt.'

The bowed head did not stir, but a low voice said: 'As true words, Madam, God help me, as were ever spoken—on one part.'

'And on mine. After so many years one may speak without reserve. I, on my return home, was to gain my father's consent. I could not obtain that consent; it would have been treason to run counter to his wishes; he was old, and there were reasons. Those reasons were simply these: his fortunes, my father's fortunes, were on the verge of ruin; the only thing that could save them was for his daughter to make a good marriage. The gentleman with whom I wished to mate was poor; even at his father's death, and that seemed distant, his fortune would not have been sufficient to save a falling house. Therefore the letter which you have done me the honour to keep so carefully, was written—not without pain, not without many vain tears, many years ago.'

The steady voice failed a little at the close, and the small dainty hands were pressed close together on the carefully smoothed gown. It was still quite light in the old garden; the cool air was full of perfume; the thud of a falling apple came from the orchard.

At length the old gentleman raised his head and said: 'I thank you, Madam, for the freedom with which you have spoken of these things.'

There is one more point upon which, if I may be permitted to speak'—

'Perhaps you would like to see the orchard again; the wrens build there still.'

Arm in arm they walked to the gate leading into it. He lifted the latch, and went in first, beating a pathway through the long grass with his stick. Then he returned and led his companion to the bench under the nut-hedge.

'You did not make this great marriage, after all, I think? Indeed, I think I am right in supposing that you have never married?'

'You are quite right. My father died within a year. There was enough left for a lonely woman to live upon; the necessity for my marriage was buried in my father's grave.'

'But, Madam, you were young and beautiful. I have heard that a disappointed love may bestow itself upon some other object.'

'My love was perhaps an old-fashioned love,' she answered, 'and perhaps I waited, thinking I might receive some sign or message from the gentleman of whom I have told you.'

'But you bound him, upon his honour, to say nothing!'

'I have heard of an honour that could'—

'Madam, perhaps his honour was an old-fashioned honour.—But I interrupt again—forgive me.'

'I will not finish the sentence; his honour and my love kept both apart—and this was forty years ago!'

'Let us no longer treat the matter thus. You were the lady; I was the gentleman. Do I surmise correctly?'

'You do,' answered the old lady.

'Then, during these forty years I have guarded both my love and honour. I have left this garden and orchard just as you saw it last; the beds have been weeded, that is all. The plants are the same, or have been succeeded by a self-sown posterity: the trees are the same—you may find your name, Madam, cut into the bark of more than one: the pigeons now upon the roof are the descendants of those which you fed from your hand forty years ago. I, too, have remained unchanged.—Madam!—and he sank upon one knee and took her hand—'we are both unchanged.'

'This, I believe, is not the manner of a gallant nowadays,' said the old lady, smiling; 'I understand that they do not kneel now.'

'My gallantry,' said the old gentleman, returning the smile, 'is an old-fashioned gallantry. But may we not come together at the end? In the beginning we were separated; let the end atone.'

'But I am an old woman now, sir. You will find at least four wrinkles on the hand you hold!'

'Madam,' he answered, 'there are at least four wrinkles upon my forehead; they may be set off against each other.'

He kissed the hand he held; and the old lady, bending a little nearer to the brave old face, said: 'As you will. If you wish it, we will pass the end together.'

He kissed her hand again silently; and drawing a ring from his finger, he slipped it upon one of those he held. Then he rose from his knee, still holding the hand, and drew it gently

within his arm, keeping his own still clasped upon it.

'May I see your snuff-box once more?' said the old lady.

'Take it,' he answered, 'and keep it in memory of these forty years—and of to-night.'

'Nay,' she said, taking it from him; 'I have this; and she pressed the diamond he had just placed upon her finger against his palm; 'but when I have need of it, I will ask you for it.'

She looked again at the face that smiled back upon her from the past, and then opened the box and took a grain or two between her fingers; so small a pinch that the old gentleman could not restrain a smile. She handed the box back in silence.

'That is the greatest compliment that has ever been paid to me,' he said.

The pulses of each had beaten so calmly for so many years, that there was no great tumult then. The two lives glided together into one stream, and journeyed on towards the darkness which would end in light.

'You have stayed here too long; the dew is falling, and I am sure you cannot see to work.'

I looked up, as though awakened out of a dream.

'It is late,' I said. 'What time is it?'

'Half an hour past tea-time.—What have you been doing?'

I pointed to the sheaf of papers on the table which I carry out into the garden on fine days to work upon, and my sweet tyrant took them up and carried them out of the shadow of the nut-hedge to the light.

'Why, this is not the story you have been working at,' she said. 'Here you seem to have described this house; but our garden is as trim and neat as any garden, I am sure, could be.'

'Yes,' I answered; 'but it was not always so. This lovely summer day and a lazy fancy have produced the little scrap of true ancestral history which you now hold in your hand.—Let us go in.'

And so we went.

T W I L I G H T.

TWILIGHT, the gray-eyed child of Day and Night,
Comes wandering through the wood with pensive face,
Tender as thoughts of home; a placid grace
Follows her footsteps, and a holy light
Strikes amid leafless boughs, as childhood's dreams,
At sight of youth, awaken in the old.
And as I watch her take her noiseless way
By glen and field and lonely water-gleams,
Lost hopes, like buds of spring, again unfold,
And rosy light comes trembling through life's gray.
Thus have I watched thee, Twilight, long ago,
Thy coming but a herald to mine eyes
Of one who followed, and who filled my skies
Not as with night, but Love's own morning glow.

MONTSERRAT.

MONTSERRAT is a little too remote from the beaten tracks of the tourist to receive many of the kind of visitors who inscribe their names in much-frayed quarto volumes, with various appendices of sonnets or criticisms about the spectacle they have travelled to see. Yet it is so lovely and peculiar a spot, that the tourist who comes within a hundred miles of it may reproach himself if he neglect it. And all things considered—especially the fact that the monastery is in Spain, and of course, therefore, accessible only by Spanish methods of locomotion—the facilities for getting at the mountain are many rather than few.

Perhaps the best idea of what one may expect to behold in Montserrat may be had from the deck of a steamer nearing Barcelona upon a calm clear morning or evening. The gaunt points of the mountain (Mons Serratus), rising one above the other, some thirty miles inland, are then very impressive. The sunset effect at such a time is one not easily matched. The glow lights up the many pinnacles with a certain glory thoroughly adapted to convince our ancestors that the mountain had something supernatural about it. Its isolation, too, in the midst of a country much less elevated than it, with convenient perches for the building of habitations of a simple kind, was sure to tempt the anchorites of old, even as nowadays it may tempt the traveller for its superb outlook over Catalonia and towards the Pyrenees.

One travels for a couple of hours from Barcelona until the little station of Monistrol is reached on the Zaragoza Railway. For the last hour of the journey the mountain has been in sight, with its white perpendicular club-like rocks, and its thick green mantle of shrubs. The aspect of it becomes more sensational every minute, especially if there be a black cloud settled on its sharp crest to pique the imagination into fancying that it towers skywards as abruptly as Babel. The eyes of the Spaniards in the train

turn towards it from all parts of the cars. They may have seen the mountain hundreds of times. It may even be as much a routine sight with them as are the chimneys of suburban London to the business man whose vocation bandies him to and fro between his villa and the city. Yet they do not tire of it, and are willing to talk of it with the neighbour to whom it is a novelty.

There is rumour of an eventual railway from the station on the main line to the plateau of the monastery some two thousand feet above it. The railway would no doubt be of the funicular kind. But one may be allowed to hope it will never be made. It is much more agreeable, and more in keeping with the savage beauty of the rocks and glens, to ascend as one does in the great coach drawn by six mules which twice a day meets the train, and takes to Montserrat what the railway has brought for it. The pace of this ascent is a little tedious; but it gives one all the more time to gaze at the rocks and admire the ingenuity of the road-makers. The track winds to and fro among the precipices, so as to give one almost a surfeit of the picturesque.

Once arrived in the monastery precincts, you must try to realise the conditions of the life into which you have entered. You are here on sufferance if you are a Protestant. But there is no fear that in such a case you may be expelled at a moment's notice. The age of persecution and intolerance has passed for Spain; or at least the Church is no longer its agent. Protestant or Catholic, therefore, you are given the key of the little bedroom in the great ugly guest-house to the right or left; and having been informed that the candle is at your own charge, and that the restaurant is at one end of the courtyard, you are free to roam about the ruins of the old building, the chambers of the new, the hermitages of the mountain above you, or its wondrous peaks and miniature plateaux. Of course, at leaving you must pay something for your room, unless you are very much out-at-elbows. But, according to the laws of Montserrat, even if you decided to endure no expense save that of your candle and

your food, the monastery would let you depart in peace, though without its benediction.

In the summer, all the scores of rooms in the building are often filled with guests from different parts of Spain. What can be more delightful? The place is notoriously sacred, even as it is notoriously beautiful, and in summer, notoriously healthy and cool in comparison with the hot plains and the seaboard. Picnic parties, therefore, arrive in brisk succession, with portly baskets and echoing laughter. Mules and horses are requisitioned; they may be wired for from Barcelona direct to the convent; and the caval-cades make the final ascent to the summit to feast among the homes of the hermits of past days, and to dally in company with the ravens and hawks until the first streaks of evening are in the sky, and the snow of the Pyrenees is paling in the north. Anon, the Ave Maria bell sounds from the high-roofed chapel of the convent; the boys of the convent school—training for missionaries beyond the sea—chant the service in a dim religious light; and supper-time has arrived. It is by no means right to approach the restaurant before the hour of the Ave, though appetite be ever so restive; and according to one of the bylaws, the service must precede the supper.

Architecturally, the monastery is ugly to the last degree. It is like nothing so much as a reformatory. The great walls of its residential blocks, pierced with little windows which give them the appearance of a number of prisons, are enough to frighten the sentimental traveller. It seems as if a night or two spent in such a place must give the deathblow to any romance that might have been dreamed about it. In truth, however, one soon turns one's eyes away from the monastery and its heavy roofs to the fascinating grotesque peaks behind it. These are like sugar-loaves set roughly side by side so as to leave a succession of abysses between them. But the sugar-loaves must be thought of as many hundreds of feet high, and the abysses between them are therefore deep enough to make one hold one's breath while gazing down them.

The monastery, which assumes to provide most things needful for the comfort of the visitor, and has a shop in its courtyard where you may buy a multitude of articles—from pins to potted meats—has also its staff of guides for the mountain, who work by a tariff. But one does not really want a guide for Montserrat. With ordinary prudence, one may roam by one's self at pleasure about the glens and defiles, and climb by steep artificial staircases from one hermitage to another until the last and the summit are reached simultaneously. This is the way to get the best impression of Montserrat. It is detestable in such a spot to be prattled at by a man whose phrases are as unromantic as Ollendorff's. The reverend fathers sell a wonderful little book which may well displace this gentleman, if the visitor yearns for a guide of some kind. It has hundreds of pages, and is arranged in the question-and-answer mode. But even this ought not to be allowed to ascend the mountain. It is better as light entertainment after supper in the monastery restaurant. One can then be sure of going to one's hard, clean, monastic bed in good-humour; and one may even laugh between

the sheets in recalling some of its exquisite simplicity.

For my part I was content to roam among the myrtles and lentisk and wild lavender of the mountain and its precipices as an unattached vagrant. It was glorious to rest at my own sweet will first on the edge of one precipice and anon on the edge of another a few hundred feet higher. The river Llobregat ran like a thread through the ruddy land at the base of the mountain, and withal so near that it seemed not impossible to spring two or three thousand feet down headlong into its turbid stream. It had been heavy weather for the past week, and from the red and purpled uplands on the other side of the river—sadly lacking in trees, like the greater part of Spain—a number of impetuous little torrents were rushing towards the greater river in the valley. I could fancy I heard their several voices as it were in a chorus, to the accompaniment of the deep bass of the Llobregat, which absorbed them and carried them all towards the sea. The birds sang in the bushes round about me, and the faint echo of the shouts of the school-boys of the monastery at play in the gardens by the avenue of cypresses, also drifted towards the white peaks of the mountain. Now and again, as my standpoint changed, I gazed across many a mile of broken land towards the Pyrenees in the north-west. It was a day of meteorological moods and fancies. At one time, a mighty storm-cloud held all the snow-peaks of the range in its black embrace. I knew fresh snow was then whirling furiously about their summits. The air chilled as the breeze stiffened from the north. Stray fringes of the cloud began to make a demonstration near the massy pinnacles of Montserrat itself; and the portents were all bad. But when everything looked at its worst, the storm on the Pyrenees began to abate, the dark cloud scampered off, much attenuated by its conflict with the pointed peaks, or broke to show the sunlight upon the new-fallen snow. The spectacle, then—of the unveiling of the Pyrenees from Montserrat—was something to be remembered with a certain feeling of awe, and never to be forgotten; and the renewal of the blue over my head with the white rocks towering towards it was no less delightful.

Thus I wandered upwards towards the summit, and those ruined hovels near it which were formerly the habitations of a number of hermits who lived and died on the mountain. One may marvel how these simple ascetics could conceive that they were doing good work in thus isolating themselves from their fellows. In the summer, their manner of life no doubt had its gratifications for such lovers of nature as they could hardly fail to become. It was then no intolerable hardship for each of them to get up at two o'clock in the morning to ring the bell of his little chapel. But in winter, even the most strenuous advocate of self-mortification among them must often have sighed for a spell of life in the plain. It was the custom for the youngest member of this community of devotees to occupy the highest hermitage—that of San Gerónimo. By-and-by, as he grew older, he was degraded to another nest, and so, when he became fourscore or thereabouts, he might chance to be tenant of the hermitage of St Anna or St Dimas, which are comparatively

near the monastery, whence medical or other aid could be more readily obtained in case of need.

The Napoleonic era, which put an end to so many ancient institutions in Europe, fairly extinguished the hermits of Montserrat. The ribald Frenchmen under Suchet hunted these good men from cliff to cliff of the mountain 'as if they had been chamois,' and slaughtered certain of them in their sanctuaries. To the same Frenchmen is due also the sack of the monastery itself, the expulsion of the monks, and the burning of its buildings. One still sees traces of the ruin thus wrought so many years ago. This was a revival with a vengeance of the early medieval vicissitudes of the mountain, when it was in the hands of a robber who had a castle on it, whence he ravaged the lower lands without mercy. The site of this rogue's castle is still preserved in one of the ruined hermitages, very appropriately the one dedicated to St Dimas, the good thief.

Nowadays, of course the ordinary visitor cannot be expected to feel any very keen reverence for these disestablished chapels and their adjacent dilapidated and vacant tenements. The clouds and the storms are year by year helping to remove them altogether. The hermitage of San Gerónimo on the summit of the mountain is a capital place for a picnic; and in summer there may be many processions thither in a day with baskets of portly size and bottles in their midst. It is certainly good to breakfast here after a climb of two hours in the fresh morning air, and to drink one's wine face to face with the stupendous Pyrenees, or neck deep in the clouds. The air is the best in Spain, and there is no stint of it. The thrills of agreeable horror excited by the precipices which intervene between the breakfast-table and the monastery, let alone the lowlands—which look insufferably bleak and hot from this fair eyrie—are like a sauce to the feast. One knows that by-and-by a deliberate false step in descent may send one speeding into a chasm that seems to be bottomless. It is always a pleasure to be thus decisively the master of one's destiny, and especially when one is in good-humour with one's self and the world. And so there is generally much more of jollity than aught else at this hermitage of San Gerónimo, even though there is a crucifix upon the adjacent mountain-top.

For three days the visitor may lead this placid kind of life at Montserrat, occupying the same room, and with no charge upon him except what the restaurant and his candle involve. But on the fourth morning the bylaws of the monastery gently but firmly put him outside the gates. The assumption in old times was probably this: even the blackest of hearts may be purged of its sin in three days, even as the generosity of the most opulent of pilgrims may be supposed in that time to have been proven to the uttermost. One might go farther, and fancy that the monks thought a little of that variety which gives such pleasant colour to life, and made this rule that their eyes might constantly be refreshed by the sight of new faces. Be that as it may, nowadays the conventional pretext is that, but for this rule, the hospitality of Montserrat would be in peril of being abused. Such and such a pilgrim might take up his abode in the *hospederia* for life, and though his means enabled him to pay daily for his bed, he would thus be lodging shamefully at the cost of the

establishment. One may therefore bow, though perhaps with reluctance, to this regulation, which compels one to depart just when the charms of the place are fastening upon the heart.

The six mules are harnessed to the big coach, and the other passengers, pilgrims like one's self, though of very different kinds, are waiting. In surrendering the key of your little room you are giving up a pleasure you could well have protracted for as many weeks as you have been allowed days for its enjoyment. The courteous steward of the bedchamber department of the monastery receives your donation with a complacent though somewhat critical eye. Perhaps your exterior has begotten high hopes in his heart. The hopes are disinterested, of course, for he is but an automaton giver and receiver. There are pilgrims who think nothing of leaving a gold piece for every night they spend on the holy mountain. They do not, by any exact standard, reckon up the worth of the bare flags of the bedchamber and the coarse sheets and linen that are supplied to them, and then pay perhaps precisely what they would have paid in an hotel. Visitors of this kind are loved at Montserrat, as elsewhere. For them the tongues of the 'fathers' are always ready to wag in the honourable office of guide, familiar, and friend. These are they who can be relied upon to buy from the store of medals and pictures and books and rosaries which under one of the most ancient nooks of the monastery offers its particoloured window to tempt the faithful. And after all, it may further be said that these are they who derive the utmost profit and pleasure from places so hallowed by age and tradition as Montserrat.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXVI.—WILL HE REMEMBER?

SHOULD she tell him? She could not. The way must somehow be prepared. No—she could not tell him just so—in cold blood. How would he look if she were to begin: 'I have found out the mystery. You are Edmund Gray. During the hours that you cannot recall, you are playing the part of a Socialist teacher and leader: you are actively propagating the doctrines that you hold to be dangerous and misleading?' What would he say? What would he feel when he realised the truth?

On the table lay a copy of the *Times*—a fortnight old copy—open at the place where there was a certain letter from a certain Edmund Gray. Elsie pointed to it. Mr Dering sighed. 'Again,' he said, 'they persecute me. Now it is a letter addressed to Edmund Gray, lying on my table: now it is the bill of a pernicious lecture by Edmund Gray: to-day it is this paper with the letter that appeared a week or two ago. Who brought it here? Checkley says he didn't. Who put it on my table?'

Elsie made no reply. It was useless to test her former theory of the boy under the table.

'As for the man who wrote this letter,' Mr Dering went on, 'he bears the name of our forger

* Copyright 1892 in the United States of America by Harper & Brothers.

and writes from the same address. Yet he is not the man. Of that I am convinced. This man is a fool because he believes in the honesty of mankind: he is a generous fool because he believes that people would rather be good than bad. Nonsense! They would rather be stealing from each other's plates, like the monkeys, than dividing openly. He has what they call a good heart—that is, he is a soft creature—and he is full of pity for the poor. Now, in my young days, I was taught—what after-experience has only brought more home to me—that the poor are poor in consequence of their vices. We used to say to them: "Go away—practise thrift. Be sober—work hard. By exercising these virtues we rose out of your ranks. By continuing to exercise them we remain on these levels. Go away. There is no remedy for disease contracted by vice. Go away and suffer." That's what we said formerly. What they say now is: "Victims of greed! You are filled with every virtue possible to humanity. You are down-trodden by the Capitalist. You are oppressed. Make and produce for others to enjoy. We will change all this. We will put the fruits—the harvest—of your labour in your own hands, and you shall show the world your justice, your noble disinterestedness, your generosity, your love of the common weal." That's the new gospel, Elsie, and I prefer the old.

Strange that a man should at one time hold and preach with so much fervour and earnestness the very creed which at another time he denounced as fiercely!

'This man, and such as he,' continued Mr Dering, lifted out of his anxieties by that subject, 'would destroy Property in order to make the workman rich. Wonderful doctrine! He would advance the world by destroying the only true incentive and stimulant for work, invention, civilisation, association, and every good and useful thing. He would destroy Property. And then? Can he not see what would follow? Why, these people do not know the very alphabet of the thing. By Property they mean the possession by individuals of land or money. But that is only a part of Property. Take that away, and the individual remains. And he has got—what you cannot take away—the rest of his Property, by which he will speedily repair the temporary loss. Consider, child, if you can, what does a man possess? He has, I say, Property—all his own—which cannot be taken from him or shared with another—Property in his brain, his trade, his wit, his craft, his art, his skill, his invention, his enterprise, his quickness to grip an opportunity. Again, he has his wife and children—sometimes a very valuable Property: he has, besides, his memories, his knowledge, his experience, his thoughts, his hopes, his projects, and intentions: he has his past and he has his future: he has, or thinks he has, his inheritance in the Kingdom of Heaven. Take away all these things bit by bit, what is left? Nothing. Not even the shadow of a man. Not even a naked figure. This, Elsie, is Property. These things separate the individual from the mass and each man from his neighbour. A shallow fanatic, like this Edmund Gray, thinks that wealth is the whole of Property. Why, I say, it is only a part of Property: it is the external and visible side

of certain forms of Property. Take all the wealth away to-day—even if you make ten thousand laws, the same qualities—the same forms of Property—the same lack of those qualities will produce like results to-morrow.—Do you now understand, child, what is meant by Property? It is everything which makes humanity. Wealth is only the symbol or proof of society so organised that all these qualities—the whole Property of a man, can be exercised freely and without injustice.'

'I see,' said Elsie, gazing with wonder undisguised. Was this last night's Prophet? Could the same brain hold two such diverse views?

'You are surprised, child. That is because you have never taken or understood this larger view of Property. It is new to you. Confess, however, that it lends sacredness to things which we are becoming accustomed to have derided. Believe me, it is not without reason that some of us venerate the laws which have been slowly, very slowly, framed: and the forms which have been slowly, very slowly, framed as experience has taught us wisdom for the protection of man—working man, not loafing lazy man. It is wise and right of us to maintain all those institutions which encourage the best among us to work and invent and distribute. By these forms alone is industry protected and enterprise encouraged. Then such as this Edmund Gray—he laid his hand again upon the letter—'will tell you that Property—Property—causes certain crimes—ergo, Property must be destroyed. Everything desirable causes its own peculiar class of crime. Consider the universal passion of Love. It daily causes crimes innumerable. Yet no one has yet proposed the abolition of Love—eh?'

'I believe not,' Elsie replied, smiling. 'I hope no one will—yet.'

'No. But the desire for Property, which is equally universal—which is the most potent factor in the cause of Law and Order—they desire and propose to destroy. I have shown you that it is impossible. Let the companies pay no dividends, let all go to the working men: let the lands pay no rent: the houses no rent: let the merchants' capital yield no profit: to-morrow the clever man will be to the front again, using for his own purposes the dull and the stupid and the lazy. That is my opinion.—Forgive this sermon, Elsie. You started me on the subject. It is one on which I have felt very strongly for a long time. In fact, the more I think upon it the more I am convinced that the most important thing in any social system is the protection of the individual—personal liberty: freedom of contract: right to enjoy in safety what his ability, his enterprise, and his dexterity may gain for him.'

Elsie made no reply for a moment. The conversation had taken an unexpected turn. The vehemence of the upholder of Property overwhelmed her as much as the earnestness of its destroyer. Besides, what chance has a girl of one-and-twenty on a subject of which she knows nothing with a man who has thought upon it for fifty years? Besides, she was thinking all the time of the other man. And now there was no doubt—none whatever—that Mr Dering knew nothing of Mr Edmund Gray—nothing at all. He knew nothing and suspected nothing of the

truth. And which should she believe? The man who was filled with pity for the poor and saw nothing but their sufferings, or the man who was full of sympathy with the rich and saw in the poor nothing but their vices? Are all men who work oppressed? Or are there no oppressed at all, but only some lazy and stupid and some clever?

'Tell me more another time,' she said with a sigh. 'Come back to the case—the robbery. Is anything discovered yet?'

'I have heard nothing. George refuses to go on with the case out of some scruple because'—

'Oh! I know the cause. Very cruel things have been said about him. Do you not intend to stand by your own partner, Mr Dering?'

'To stand by him? Why, what can I do?'

'You know what has been said of him—what is said of him—why I have had to leave home'—

'I know what is said, certainly. It matters nothing what is said. The only important thing is to find out—and that they cannot do.'

'They want to connect Edmund Gray with the forgeries, and they are trying the wrong way. Checkley is not the connecting link—nor is George.'

'You talk in riddles, child.'

'Perhaps. Do you think, yourself, that George has had anything whatever to do with the business?'

'If you put it so, I do not. If you ask me what I have a right to think—it is that everything is possible.'

'That is what you said about Athelstan. Yet now his innocence is established.'

'That is to say, his guilt is not proved. Find me the man who forged that cheque, and I will acknowledge that he is innocent. Until then, he is as guilty as the other man—Checkley—who was also named in connection with the matter. Mind, I say, I do not believe that my Partner could do this thing. I will tell him so. I have told him so. If it had to be done over again, I would ask him to become my Partner. But all things are possible. My brother is hot upon it. Well—let him search as he pleases. In such a case the solution is always the simplest and the most unexpected. I told him only this morning—he had lunch with me—that he was on a wrong scent—but he is obstinate. Let him go on.'

'Yes—let him divide a family—keep up bitterness between mother and son—make a lifelong separation between those who ought to love each other most— Oh! it is shameful! It is shameful! And you make no effort—none at all—to stop it.'

'What can I do? What can I say, more than I have said? If they would only not accuse each other—but find out something!'

'Mr Dering—forgive me—what I am going to say'—she began with jerks. 'The honour of my brother—of my lover—are at stake.'

'Say, child, what you please.'

'I think that perhaps'—she did not dare to look at him—'if you could remember sometimes those dropped and forgotten evenings—those hours when you do not know what you have said and done—if you could only remember a little—we might find out more.'

He watched her face blushing, and her eyes confused, and her voice stammering, and he saw that there was something behind—something that she hinted, but would not or could not express. He sat upright, suspicious and disquieted.

'Tell me what you mean, child.'

'I cannot—if you do not remember anything. You come late in the morning—sometimes two hours late. You think it is only ten o'clock when it is twelve. You do not know where you have been for the last two hours. Try to remember that. You were late on Saturday morning. Perhaps this morning. Where were you?'

His face was quite white. He understood that something was going—soon—to happen.

'I know not, Elsie—indeed—I cannot remember. Where was I?'

'You leave here at five. You have ordered dinner, and your housekeeper tells me that you come home at ten or eleven. Where are you all that time?'

'I am at the Club.'

'Can you remember? Think—were you at the Club last night? George went there to find you, but you were not there—and you were not at home. Where were you?'

He tried to speak—but he could not. He shook his head—he gasped twice.

'You cannot remember? Oh! try—Mr Dering—try—for the sake of everybody—to put an end to this miserable condition—try.'

'I cannot remember,' he said again feebly.

'Is it possible—just possible—that while you are away—during these intervals—you yourself may be actually—in the company—of this Socialist—this Edmund Gray?'

'Elsie—what do you mean?'

'I mean—can you not remember?'

'You mean more, child! Do you know what you mean? If what you suggest is true, then I must be mad—mad. Do you mean it? Do you mean it? Do you understand what you say?'

'Try—try to remember,' she replied. 'That is all I mean. My dear guardian, is there any one to whom I am more grateful than yourself? You have given me a fortune and my lover an income. Try—try to remember.'

She left him without more words.

He sat looking straight before him—the horror of the most awful thing that can befall a man upon him. Presently, he touched his bell, and his old clerk appeared.

'Checkley,' he said, 'tell me the truth.'

'I always do,' he replied surlily.

'I have been suffering from fits of forgetfulness. Have you observed any impairing of the faculties? When a man's mental powers are decaying, he forgets things: he loses the power of work: his old skill leaves him: he cannot distinguish between good work and bad. He shows his mental decay, I believe, in physical ways—he shuffles as he walks: he stoops and shambles—and in his speech—he wanders and he repeats—and in his food and manner of eating. Have you observed any of these symptoms upon me, Checkley?'

'Not one. You are as upright as a lance: you eat like five-and-twenty: your talk is as good and your work is as good as when you were forty.—Don't think such things. To be sure you do forget a bit. But not your work. You only

forget sometimes what you did out of the office—as if that matters. Do you remember the case you tackled yesterday afternoon?’

‘Certainly.’

‘Do you tell me that any man—forty years younger than you—could have tackled that case more neatly? Garn! Go ‘long!’

Checkley went back to his office.

‘What did she mean by it, then?’ Mr Dering murmured. ‘Who put her on to such a suspicion? What did she mean by it? Of course it’s nonsense.’ So reassuring himself, he yet remained disquieted. For he could not remember.

At half-past five or so, Mr Edmund Gray arrived at his Chambers. The outer door was closed, but he found his disciple waiting for him. She had been there an hour or more, she said. She was reading one of the books he had recommended to her. With the words of Mr Dering in her ears, she read as if two voices were speaking to her—talking to each other across her.

She laid down the book and rose to greet him. ‘Master,’ she said, ‘I have come from Mr Dering. He is your solicitor, you told me.’

‘Assuredly. He manages my affairs.’

‘It is curious—I asked him if he knew you—and he said that he knew nothing about you.’

‘That is curious, certainly. My solicitor for— for many years. He must have mistaken the name. Or—he grows old—perhaps he forgets people.’

‘Do you often see him?’

‘I saw him this morning. I took him my letter to the *Times*. He is narrow—very narrow in his views. We argued the thing for a bit. But, really, one might as well argue with a stick as with Dering when Property is concerned. So he forgets, does he? Poor old chap! He forgets—well—we all grow old together.’ He sighed. ‘It is his time to-day and mine to-morrow.—My Scholar, let us talk.’

The Scholar left her Master at seven. On her way out she ran against Checkley, who was prowling round the court. ‘You!’ he cried. ‘You! Ah! I’ve caught you, have I? On Saturday afternoon I thought I see you going into No. 22. Now I’ve caught you coming out, have I?’

‘Checkley,’ she said, ‘if you are insolent, I shall have to speak to Mr Dering;’ and walked away.

‘There’s another of ‘em,’ Checkley murmured, looking after her—‘a hardened one, if ever there was. All for her lover and her brother! A pretty nest of ‘em. And calls herself a lady!’

WRECK-RAISING.

WRECK-RAISING has long passed from the experimental stage. It has become a very necessary part of the economics of Great Britain’s maritime trade. Years ago, when ships were built of wood, and our sea-trade was but in embryo, maritime disasters were of necessity much less numerous than they are at present; nor were they of so complete or serious a nature as those which mark the iron age of the nineteenth century. The percentage of vessels so mysteriously abstracted from our merchant fleets and returned as ‘missing’ was then less than the number now included in that sad category. The buoyancy of the ship-

building material then used, combined with the great structural toughness of the wooden vessel, enabled these old-time carriers to make comparatively little of a stranding. They could ‘get off’ and ‘proceed’ under circumstances that must have resulted in the total loss of an iron or steel vessel.

Modern vessels have been aptly compared to pieces of crockery, very useful and very necessary, but extremely liable to get cracked. The cracking process, whether the result of collision with another vessel or of sudden impact with some submerged rock, frequently leads to the foundering of the vessel. Under the old *régime* a vessel that thus went to the bottom remained there until she was entombed in the shifting mud or sand, or else had undergone a process of gradual dissolution, hastened by the ebb and flow of tides and currents. Wreck-raising was then a science practically undreamt of. Some crude operations were carried on, it is true, at several sunken wrecks; but the object aimed at was the recovery of treasure, and not the raising to the surface of the vessel containing it. The development of mechanical science and steam-power has placed in the hands of modern wreck-raisers machinery that has enabled them to lift many a fine ship from her oozy bed, and restore her to her proper place among the floating argosies of commerce. Most of the vessels that are raised, after suffering submergence beneath the waves, are the victims of collisions; and these, as might naturally be expected, are most frequent in the crowded waters of our own harbours and their approaches. The chief economic purpose served by wreck-raising is the keeping clear of *impedimenta* the fairways leading to the large seaports. Sensational wreck-raising attracts the attention of the whole civilised world, especially when the catastrophe which resulted in the sinking of the vessel was attended by an awful life-loss or other sensational features.

Her Majesty’s ship *Eurydice* was lost during a blinding snow-storm off the Isle of Wight on the 24th of March 1878. The sad loss of so many bright young lives was very painfully felt over the whole country. All subsequent information relative to the fate of the sunken training-ship was eagerly sought for by the public; and the raising of the vessel herself was witnessed by the Prince of Wales from his yacht *Aline*. The waters of the English Channel then looked as calm and clear as possible, and the sun shone brightly upon a scene which must have been in marked contrast to that which obtained when the blinding snow-squall capsized the ill-fated *Eurydice*, and sent her and her living freight to the bottom.

The raising of Her Majesty’s ship *Sultan*, which struck upon an uncharted rock in one of the water-channels of the Maltese group of islands, was another case that excited much attention. The foundering of the *Utopia* after collision with some of the British fleet riding at anchor in the Bay of Gibraltar, and the awful life-loss that resulted, will long be remembered. The mishap, however, occurred in comparatively shallow water, and but little difficulty was experienced in raising the sunken vessel.

But the most valuable work accomplished by wreck-raising processes is done so quietly and

unobtrusively that the general public are unaware of its magnitude and importance. The harbours of Great Britain are the points to which is focussed a vast amount of the world's trade, and as a result, the convergence of so many vessels to these waterways means very great risk of collision. Strandings, too, are frequent, for the difficulties of navigating tortuous channels and keeping out of the way of other vessels are very great. The average number of vessels that meet with mishap each year in the Thames above Gravesend is about eleven hundred; while in the Mersey over three hundred come to grief; and some sixty annually meet with disaster in the section of the Clyde above Greenock. Of course many of these accidents are of no very serious nature; but some result in vessels sinking right in the path of ships using the much-frequented waterways mentioned above. These wrecks must be removed with all possible speed, for they are a source of great danger. To guard against collision with the sunken vessel the first step taken is to moor the warning wreck-boat near the scene of the disaster and to issue 'Notices to Mariners,' apprising them of the submerged danger to navigation. The form that these notices generally take will be best seen from the one quoted below:

SUNKEN STEAMER.

NOTICE is hereby given that the large screw steamer CRYSTAL, 330 feet long, lies SUNK in about seven fathoms at low water, outside the ENTRANCE to the RIVER TYNE, about 200 yards south of the line of Harbour leading lights, and about 400 yards east of the south pier end. The vessel, which is entirely submerged, is heading west with the following marks and compass bearing, viz.: Tynemouth Castle Light, NW. $\frac{1}{4}$ N. South Groyne Light, W. $\frac{3}{4}$ N. The sunken vessel is marked by day by a GREEN BUOY, placed a little to the eastward thereof, and at night a STEAM-TUG, exhibiting Two WHITE LIGHTS placed horizontally, will ride or be in proximity thereto.

Many Harbour Boards have their own wreck-removing plant, and then their divers make a preliminary examination of the sunken vessel, with the view of ascertaining whether it is a case for blowing up or raising. When Harbour Commissioners do not possess the necessary plant, they advertise for tenders for the performance of the work. This of itself shows to what an extent the science of wreck-raising has developed. Years ago, the practice pretty generally obtained of removing submerged dangers by blowing them to pieces; but when the disaster has occurred in shallow water, this is now regarded as wasteful and quite unnecessary. It is now some fifteen years since the Thames Conservancy Board perpetrated such an act of destruction. Within the last eleven years they have raised no fewer than 399 vessels from the river-bed and restored them to their owners. Of this number, 72 were steamers with a registered tonnage of 57,992 tons; 49 were sailing-vessels, with a total tonnage of 9781; and 278 were barges, with a total tonnage of 11,113.

The wreck-raising plant includes a screw-tug, three 150-ton lighters, each fitted with steam-winch and steam-pumps; two 150-ton and two

300-ton lighters without steam-power; and two 400-ton lighters with central wells, and fitted with patent wire compressors. Of course, the other vessels of the Conservancy Board can be requisitioned for salvage-work as well, if occasion requires. A complete diving equipment is also provided, and an abundant stock of wire and other rope.

When a collision takes place and a vessel sinks in the fairway of the river, the wreck-boat alluded to above is moored *in situ*, and the diver makes his examination. All the loose gear that may militate against the success of the undertaking is removed, and a number of wire-cables are made fast. Care must be taken to ensure a perfect distribution of the strain over the submerged vessel. The cables are entrusted to stand a tension of 150 tons, and although they sometimes, though very seldom, break, the point of fracture is generally under water along the keel of the vessel operated upon, and thus the lives of the sailors are not endangered. The number of cables passed under the vessel varies with her size, as many as twelve or fifteen sometimes being employed. These are made fast to the lighters at dead low-water. The lighters themselves are submerged as far as possible when this is done. They are then pumped dry, and as the tide rises, the wrecked vessel leaves her bed in the mud and sand and slowly rises to the surface. Then the powerful centrifugal pumps, one of which is capable of raising something like 110,000 gallons per hour, are set at work, and the wreck pumped sufficiently dry to enable her being floated away for repairs. With the appliances possessed by the Conservancy Board, ships can be raised whose weight under water does not exceed 1800 tons. A multiplication of the existent means would of course enable larger vessels to be raised. But larger vessels very rarely sink in the fairway, as, after being in collision, they remain afloat long enough to enable their masters to run them aground before they finally settle down.

The necessity for adequate means of wreck-raising increases each year, for, in spite of every care, casualties do and always will happen. During the past year, no fewer than 42,598 vessels used the navigable channels of the Mersey. When it is remembered that this gives a daily average of 117 vessels, and that this traffic, instead of being spread uniformly over the whole day, is concentrated to the time of high-water, the liability to collision will be readily understood. The difficulties of wreck-raising in the Mersey are very great; the silt accumulates so rapidly that a vessel is speedily buried to a great extent. In some cases it has been found necessary, where a vessel had sunk upon a rocky bottom, to cut channels through the solid rock under the vessel's keel, in order that the cables might be passed underneath her.

One of the most interesting cases of wreck-raising that the annals of the Mersey can boast is that of the sailing-ship *Locksley Hall*. It is now some years since ferry passengers were surprised to see on one Sunday morning the top-masts of a full-rigged ship projecting above the water right in the middle of the Mersey. They belonged to the above-named vessel, which had arrived the night previous from San Francisco, and after surviving the risks incidental to a

long ocean voyage, had been sunk in collision right on the very threshold of home. The appliances possessed by the Mersey Docks and Harbour Board were inadequate to raise so large a vessel; and it was agreed that to destroy so fine a ship by blowing her up would be a wanton piece of destruction. At length the principle which Archimedes of old had enunciated, that a body weighs less and requires less suspending force in water than air, was acted upon; and the firm entrusted with the work had the satisfaction of successfully beaching the ship. The method adopted was somewhat similar to that we have described as practised on the Thames. 'Camels'—as the lifting lighters are generally called—were attached to the cables that were passed under the vessel at low-water. After much labour, the ship was raised. But it was no part of the plan to raise her to the surface—that could not be done. She was raised from her resting-place as the tide rose; and as the lighters floated on the surface, the vessel to which they were attached was just raised the tide's height and no more. Tugs were then employed to tow the lighters and their sunken prize towards the spot selected for beaching. This, of course, could not be made in a single tide, for, when the tide dropped, the *Locksley Hall* again took the ground, and the submarine voyage had to be accomplished in easy stages. The journey over, the vessel was beached on the strip of shore adjacent to the pretty residential district of Rock Ferry, on the Cheshire shore of the Mersey.

Although at the time such a method of wreck-raising was regarded as unique, and attracted much attention, the inhabitants of the locality were glad to see the *Locksley Hall* temporarily repaired and towed across to Liverpool, to undergo a thorough overhaul prior to again sailing the seas. Her cargo consisted principally of grain, and this during the vessel's sojourn in the river-bed had undergone decomposition, so that the unsavoury odour emanating from the beached vessel when the tide left her at low-water can be better imagined than described.

With sailors, a raised vessel is always popular. The fact that she has been sunk once argues, they think, against her repeating the operation by visiting the bottom. It very frequently happens in a swift tidal estuary like the Mersey, whose dock entrances are at right angles to the direction of the stream, that collisions are so violent that small vessels are absolutely cut in two by the sharp knife-like stem of the large merchant steamer's bow. Then each half of the wreck is raised and beached separately, and sometimes the strange sight is presented of the fore-part of a vessel lying on the beach all rusted and deranged, while the after-portion of the same vessel lies a quarter or half a mile away.

A curious incident occurred quite recently in connection with a collision which resulted in the sinking of a coasting schooner. The colliding steamer stood by after running into the smaller vessel, and seeing she was evidently settling down, launched a boat to rescue the crew. The night was dark and the sea rough, and though the shore was but some four or five hundred yards away, the situation was a dangerous one. One of the crew of the coaster when about to jump into the steamer's boat said he had for-

gotten to see to the dog. The animal was a large one, of the Newfoundland type, and his deep bark had never ceased since the first impact of the collision. When the owner of the dog returned, the rescued crew were soon on board the sailing-vessel's deck. Nothing more was thought of the dog incident, until his frantic appeals for help made it patent to all that he was still on board the sinking vessel. When remonstrated with for not bringing him off, the owner stated that he had left him to see to the vessel, that he had securely fastened him so that he could not be washed away either dead or alive. The boat was again hurriedly lowered; but the schooner had drifted away, and by the time she was reached, the dog's struggles were over, for she had settled down, and only the top of her mainmast was visible. When the wreck was raised, the body of the dog was discovered secured in such a manner as to render it impossible for him to be separated either in life or death from the wreck. In the early days of our merchant shipping, the 'schippe dogge' was a necessary part of the equipment of every vessel.

All wrecks in ancient time were deemed the property of the crown, but by a statute of Henry I. the harsh consequences of this law were avoided when any person, male or female, escaped. A still more humane enactment of Henry II. extended the property-saving clauses of the statute so as to include man or beast. Hence the custom that still lingers of having a 'ship dog' on board. It must be remembered, too, in connection with the above incident, that coasting hands are derived in the main from old-fashioned fishing villages and secluded coast towns, where old-world traditions die hard. It was some vague and shadowy idea that by the possible sacrifice of the dog the vessel might be secured to her owner in spite of her being wrecked, that led to the animal being abandoned without being allowed a chance to escape from a watery death.

With all our modern scientific and mechanical knowledge, wreck-raising can only be carried on in comparatively shallow water. Diving operations can, of course, be carried on at a greater depth. Thus, in the year 1885 the screw steamer *Alfonso XII.* went down off Las Palmas in 165 feet of water. As she had specie on board to the amount of £70,000, it was very desirable that steps should be taken to recover this amount, if possible. Accordingly, a London firm were engaged, with the result that the £70,000 was removed in safety from the bullion-room of the sunken vessel, and raised to the surface.

Progress in wreck-raising has been very rapid during the past few years; but there is still room for extension and improvement. A perusal of each succeeding wreck-chart issued by the British Board of Trade shows that the floor of the English Channel and the Strait of Dover must be literally paved with wrecks. It is the graveyard where many a gallant ship, cut off with years of useful service before her, lies buried in the shifting sand and silt. An extension of wreck-raising facilities would result in many of these sunken vessels being restored to their owners, for the sea in question is but shallow. The only means that existed in the past for removing a wreck from a fairway was to destroy the impediment by blasting. This is, however, a wasteful

process, and has been to a very large extent superseded by raising. To raise a wreck was once regarded as impossible; now, within certain limits, it is quite an every-day operation. Extend those limits, and many a valuable ship that lies on the sea-floor near our coasts will again resume her career of usefulness, and much loss and waste of energy and wealth will be prevented.

THE BELLS OF LINLAVEN.

CHAPTER II.—RAFE THE PEDLAR'S DISCOVERY.

It was the year of that Egyptian campaign in which the battle of Tel-el-Kebir had been fought and won after the long night-march beneath the stars. The British army thereafter entered Cairo, carrying their sick and wounded with them. In the hospital quarters an officer sat writing at a table. He was dark in complexion, as if he had been for many months under the burning glare of a sub-tropical sun; while the thin and wasted face showed that he had been and still was an invalid. In the regiment he was known as Captain Norham, but to the Vicar of Linlaven and to the Captain's young wife whom we saw enter the Vicar's study at the close of the last chapter, he, the absent one, was simply and more kindly spoken of as George. And it was to these dear ones at home—to his wife—he was writing now. Let us look over his shoulder and follow his pen.

'One evening,' he writes, 'I had a strange experience. It was after the receipt of my father's letter in which he informed me that your grandmother had resolved to settle her own property otherwise than upon you. I had been in a despairing mood for some days. My wound was not healing well, and I worried myself into something like delirium as I thought of the helpless state in which my death would leave you and our poor children. That you should be entitled by all the obligations of natural law and family ties to the provision which your father's mother has it in her power to make for you, and yet to be cut off therefrom by a perverse and unnatural act of will on the part of one so nearly related to you—I say, the thought of all this burned into my brain, and must have goaded me into a kind of frenzy.'

'I do not know whether it was in a state of delirium or in a dream, but I found myself in the dear old church at home—the church of Linlaven. I was seated in my father's pew, all alone. It was night, and yet somehow it was not quite dark. The church was filled with a soft luminous haze, as of moonlight through obscured glass. I sat, absorbed in the perfect stillness of the place. Then up in the church tower I heard the bell strike one—two—three—slowly, solemnly—till it had struck twelve; the last stroke dying away in long melancholy vibrations; and once more the church was all still as death. I then observed that the west door was open, and that a white belt of light lay across the porch. I saw, too, a figure standing there, shadowy, ghost-like, and yet alive. He entered, and moved slowly up the aisle until he had almost reached the altar. But he did not approach farther, for at this point he came over

towards where I was sitting, then turned and stood before the burial-place of the Norhams of Brathrig Hall. I was close to him, and I knew him. My dear wife, it was your father, Arthur Norham! I never saw your father in life; and yet somehow I knew that this ghost, or apparition, or eidolon, or whatever it was, was your father. I could have touched him, I was so near; but I could not stir. He did not appear to be aware of my presence; but my eyes followed his, and I saw he was reading the letters on the white marble tablet which records his father's death. He stood before it with bowed head, as if in deep dejection and grief, and I heard these words uttered: "*He—gone; and I—unforgiven!*" At that moment, a crash as of thunder rang through the church, and the whole scene disappeared in the twinkling of an eye. I woke up. It was only the sunset gun; and I must have been dreaming.

'I was greatly disturbed by the dream, and am still. That I should identify a man whom I never saw in life, and should feel so sure that he was your father, almost appears to indicate something like an insane delusion on my part. Your father must have quitted his father's house about the time of my birth, and so his personal appearance could not be known to me. But I will describe him, and my father will judge. He was dressed in a riding-coat and boots, his head was uncovered, and his hair was dark, and curled closely round his head. He wore no beard; but there was not light enough for me to note his complexion or the colour of his eyes. Only, somehow, I knew it was your father as surely as if he had been known to me all my life. I wonder what all this portends, and whether it is due alone to my feverish state of mind, or to some other cause which has hitherto shrouded in darkness the mystery of his disappearance.'

The above letter, with all its other details of love and longing for absent ones—which we leave to the reader's imagination, only giving what concerns our story—this letter, written in the hot glare of an Egyptian sun, was that which Wilfrid Norham carried to the vicarage of Linlaven on the night of the fierce October storm. Wilfrid was the Vicar's second son, destined to succeed him in his sacred office. The lady, the wife of the absent soldier, was the Vicar's daughter-in-law, and the sole child of that ill-fated marriage between Arthur Norham and Esther Hales, the announcement of which at Brathrig Hall thirty years before had led to the old Squire's fierce wrath, driving him onwards within the hour to a violent death.

The Vicar of Linlaven was of the kin of the Norhams of Brathrig Hall, but the tie of relationship was thinning with time, and would hardly bear the strain of any degree of cousinship. But still he and his two sons—Captain George in Egypt, and Wilfrid at home—were of the true Norham stock. The Vicar and the missing Arthur Norham had been at school and university together, and their friendship had been close and keen. So also had been the Vicar's relations with the family at the Hall, till the time came when Arthur went off upon what his father regarded as a mission of folly; after which the friendship between the Vicar and the Squire

somewhat cooled. The latter was angry with his son for quitting the ways of his ancestors, and he was equally angry with the Vicar because he refused to take the Squire's side against Arthur.

Nor was the death of the Squire the only calamity that followed upon these events. The Squire's lady, now a widow, had hitherto been of a gentle and loving nature, particularly fond of her husband and children. But from the hour that she saw her husband's dead body carried into the hall, a change, almost phenomenal, passed over her. Her husband's death had been due to her son Arthur's disobedience. It was much as if he had struck a dagger into his father's bosom. It was simply murder. The boy had left his home without his father's knowledge; had married without his father's consent; had married a low woman they had never seen; had disgraced the family name, and then had written a letter that killed his father. That was how the grief-stricken mother looked at it, until the bitterness of her soul deepened into something like deadly hatred of her son Arthur. She would not allow the Vicar to speak to her on the subject; he had simply aided and abetted her son in the murder of her husband.

And Arthur himself, and Arthur's wife or widow—what calamity had likewise overtaken them? Everything that was possible was done to trace Arthur, but nothing availed. He had gone like last winter's snow. He could not have wilfully deserted his wife, because the deepest and warmest affection had always existed between them. And she, left with her little baby Clara, was heart-broken, and did not survive much over a year. The Vicar's wife was then alive, and, when the young mother died, took home the little Clara, and brought her up with her own two boys, and was a true mother to the child.

Even the fact of this poor child's orphaned condition failed to soften the wild and unnatural resentment of the old lady at the Hall—Dame Norham, as she was generally styled. She would not see the child; refused to look upon it. That it was the offspring of her own son was nothing to her; he had been a wicked and unnatural son, and had murdered—yes, murdered—his own father. She had been left by her husband sole executrix of his property and estates, and never, so long as she could help it, should the child of this unknown, meanly-born Esther Hales, own a single shred of them.

Her only remaining son, Jim, counted upon succeeding to the estates of his father after his mother should depart this life; but Jim the dissipated youth had grown up to be a dissipated man—had burned, so to speak, the candle of life at both ends, and had, good ten years ago, passed into a nameless grave in a foreign land. His sister, too, had died, unmarried; and now, the estates and other property were designed for the possession of a very distant branch of the family, the Linleys of Longarth, according to the fiat of this hardened old mother, whom neither calamity nor death was able to soften.

So variously does adversity act and react on different natures. Some it ripens into a sweeter and nobler fruition; others it dries up and warps into sapless rigidity.

All this was in the minds of this little family group as they sat there with George's letter before them. To the Vicar it recalled thoughts of Arthur Norham in the days of their youth and friendship long ago.

'Yes,' he said to Clara, 'the appearance of the figure which George saw in his dream is like your father as I last saw him. I expect that I must have described him at some time or other to George, and that the picture I then drew has lain latent in his mind until recalled to his memory while in a state of semi-delirium. Yet it is very strange and very painful to have the past brought back to me so vividly as this dream does.'

No one spoke for a time. Clara was evidently thinking less about the dream and the strangeness of it, than of her husband's condition in that distant foreign land. Where, in the course of his letter, he spoke with much hope of his final recovery to health, she, as she read these words silently to herself, strove with a woman's insight to read between the lines much which she fancied he had left unspoken lest he should add to the sorrow and the hope deferred from which she had already suffered so much. The tears that came unbidden to her eyes were an index of the mental struggle through which she was passing.

'It is a shame!' said Wilfrid, angrily breaking the silence, as he rose and began to walk hurriedly up and down the room.

'What is a shame, my boy?' asked the Vicar.

'That Arthur's own mother up there at the Hall should act with such persistent and merciless hostility towards her son's children. Why, Arthur Norham was flesh of her flesh and blood of her blood, so also are Clara and her two children. The woman cannot get rid of that fact; why, then, should she exhibit a kind of savage delight in facilitating arrangements to put the estates past them? I had some talk to-day with Mr Brookes when I was in town, and he says everything is practically settled, that that rascally Linley of Longarth is to have the property, and Clara and her children are to be left to starve, so far as Arthur's mother is concerned. I say again, it is worse than a shame—it is a scandal. Why, Arthur Norham did not sin half so deeply against his father, as she, his own mother, is sinning against him and his.'

Clara lifted her eyes to Wilfrid, and there was a look of gratitude on her face. It sometimes does us good to hear our own feelings expressed for us.

The Vicar was silent for a while, and then he spoke, calmly, and as if to check the rising anger of his son.

'You must not forget, Wilfrid,' he said, 'that it is doubtful if Arthur's mother can help herself so far as the Brathrig estates are concerned. No doubt she could—and as a Christian and a mother she should—make provision for Clara and the children out of her own private possessions. But as for the estates, that is a somewhat different matter, and she has not quite a free hand. When Arthur Norham left his father's house and remained so many years absent, the Squire, as a man of perception and knowledge of the world, could not fail to perceive that a young man with the strong and heady impulses of his son, and at an age when youth is peculiarly susceptible,

would run a danger of marrying some one in the class of life with which he had now associated himself. However respectable and worthy that class might be, the persons forming it were not such as the Squire, with his old-world notions of things, could quite approve of as family connections.—Do not speak, Wilfrid; I am not going to argue the point.—Well, things being so, he had made up his mind that, if Arthur survived him, he should, married or unmarried, succeed to the property, being the elder of his two sons. But—and this is what I draw your attention to—if he predeceased his father, and had previously made a marriage without his father's consent, then the children of that marriage were to be completely and perpetually cut off from any benefit in, or succession to, the estates.'

'Ah,' said Wilfrid, 'that's rather a different story.'

'Yes,' continued the Vicar; 'that is why I am so much moved by this dream of George's. We found it quite impossible to obtain any clue to Arthur's movements after he left his home, which was but the day before his father's fatal accident. From that time Arthur no longer communicated with the family lawyer, or drew upon the sum of money which was payable to him, as previous to his disappearance he had regularly done. We might, if we were rich, fight the matter out in the courts of law; but the presumption would still remain against us, as we could not prove that Arthur Norham was alive at the time of his father's death. Nearly thirty years have passed, and the mystery of his disappearance has never yet been solved. But I agree with you in thinking that Arthur's mother, seeing that she has ample means of her own, ought to make some provision for the future of Clara and her children.'

For more than an hour the three sat conversing on what lay so near to the heart of each—George's restoration to health, and the sad possibilities that might ensue if the event were not restoration. At length Clara pleaded fatigue, and retired for the night, carrying her husband's letter with her, no doubt to weep and pray over it alone, as good women do. Father and son continued to sit there for another hour, not saying much one to the other, but smoking together in the silent confidence of friendship, which at such times is better than talk.

The hour of eleven had pealed out from the church-tower, when a loud ring was heard at the door-bell. Shortly thereafter Mrs Sommes, the old housekeeper, entered the study.

'Please, sir,' she said, addressing the Vicar, 'that be the gardener come to tell us that Rafe, the owd Scotch pedlar, have found a pore man a-lying to-night on Brathrig Fell, and Lawrence Dale the miller and some more o' them ha' gone up and carried him down. They ha' made a bed for him in the Owd Grange, and please, sir, could Mrs George let us have some blankets and wraps to cover the pore man, for gardener says he be as near dead as ever man can be?'

The Vicar replied that Mrs George had retired for the night, and was not to be disturbed; but that she, the housekeeper, was herself to give the gardener what was necessary.

Wilfrid started to his feet, and said he would

himself go down to the Old Grange, and see what was afoot.

The Grange was a tall building just beyond the vicarage garden. The night was now comparatively calm, and the old building could be seen standing out black against the sky. From the doorway a gleam of light shone out; and on entering, Wilfrid saw the pedlar, with some others, standing beside his pack, lantern in hand, and before him the figure of a prostrate man on a roughly extemporised bed, evidently in a state of unconsciousness. Wilfrid put his hand on the man's wrist, and after a time satisfied himself that the pulse was beating—feebly and intermittently, but still beating. The gardener arrived from the vicarage with blankets and other coverings, in which the old man was carefully wrapt; and the pedlar volunteered to stay there for the rest of the night beside the man, and to give warning to the neighbours if anything happened to render help necessary.

Wilfrid thanked him for his kind offer, and bade the men good-night, promising to see to the sufferer in the morning. The others also retired, all except the pedlar, to whom Lawrence Dale the miller stepped back a pace, and whispered: 'Rafe, I fear that poor creature has something on his mind. Let what we heard him say yonder on the hillside to-night lie a secret between thou and I. It would ill become us to bring mischief on gray hairs like his.'

And so exit.

The cold gray light of morning crept slowly over the silent hills and into the brown dales of Cumberland. The wind had died away; but Nature, like an ailing child that has not slept, met the coming day with a dim and tearful look. In the Old Grange at Linlaven the sufferer of yesternight still lay tossing in the weird delirium of pain, and with the fierce light of fever in his eyes.

Wilfrid and Clara entered early, and stood together a little distance off, arrested in their approach by the wild look on the sufferer's face. He heeded not their presence. He saw them not, nor heard. Clara went close up to him, and could note that the pale light of the October morning was revealing the pinched and worn face of an aged man, with suffering writ large on every feature. He was still in a state of unconsciousness, and the sounds that escaped his lips were but the rapid, unintelligible, continuous monotone of delirium, which falls so strangely on the watcher's ear.

She returned softly to Wilfrid's side, and advised him to send immediately for a doctor. When left alone, she turned once more to where the man lay.

'Poor creature,' she said aloud; 'what can have brought his gray hairs to this?'

The sound of her voice appeared to arrest the attention of the man, and to recall his wandering mind. By a quick movement, but evidently not without pain, he half raised himself on his elbow, stretching out the other hand towards Clara with an agitated gesture of appeal.

'Esther,' he cried, in wild, distracted tones—'Esther! ha' thou coomed to forgive me? Ha' thou coomed to tell me it were all a black mistake—a horrible dream from which I am

now awaking? Tell me, truly, Esther—tell me! And in his eagerness he seized her hand and pressed it to his burning lips. Then, as if the effort had utterly exhausted his feeble strength, he fell back on the rude couch, and his eyes relapsed into their former look of wild and wandering vacuity. If the veil of oblivion had for a brief moment been lifted from his mind, it must have fallen again as suddenly; for the room is once more only filled with the hoarse murmur of his inarticulate ravings.

Clara, as she dropped his hand, turned from him with a scared and bewildered look. Her face was ashy pale; and, as Wilfrid at that moment re-entered, she made him some hurried excuse and fled out into the open air.

She did not stay till she had reached the vicarage and had entered the house.

'What a strange thing to fancy,' she said to herself. 'Yet why did he call me Esther? That was my mother's name. It cannot be!'

And she entered her own room, and shut to the door.

CORSICAN FOLKLORE.

SOMEWHAT more than a hundred miles from the southern coast of France lies the island of Corsica, an island which, for its wild romantic scenery, its wealth of historical associations, and the distinct individuality of its people, is well calculated to awaken the keenest interest of the student, the antiquary, and the traveller. The Cyrnos of the Greeks, the Corsica of the Normans, its possession was often fiercely contested by the great naval powers of ancient times. It has been conquered in turn by the Carthaginians, the Romans, the Saracens, the Genoese, and the French; but through all these varied changes of government, through all the vicissitudes of centuries, the inhabitants have still preserved those peculiarities of manners and customs, and that strange mixture of civilisation and semi-barbarism, that serve to stamp them as a race apart from the other peoples of the South. In this nineteenth century of progress, when the speculative mind of man refuses credence to much that were established beliefs fifty years ago, it is refreshing to meet with a people who have not yet lost their primitive simplicity.

The Corsicans have an aptitude for learning, but they have a still greater love for liberty; and the protracted struggles they have had to sustain against the enemies who threatened that liberty from without will in some degree help to explain the mental condition of a large proportion of the race. The very character of the country, too—the lofty mountains, the wild and gloomy gorges, the dark monotonous extent of forests—all tend to nurture a host of superstitions, which retain a firm hold upon the minds of the dwellers among them. In the towns and the more frequented parts of the island, there is a well-defined fringe of civilisation, and the visitor to Ajaccio or Bastia may enjoy all the ordinary comforts and luxuries of continental life; but in the more remote districts, where the little hamlets cluster like eagles' eyries on the mountain sides, the natives preserve in all their integrity many of the peculiarities and customs of olden times. The

national characteristics of this people are strangely complex; brave, hospitable to strangers, virtuous and intelligent, with a love of freedom and a simplicity of life unspoiled by contact with the outer world—these wholesome traits are yet counterbalanced by an insatiable thirst for revenge, a ferocity in resenting insult or injury that belong rather to a wholly savage than to a semi-civilised nation. The *vendetta*, which in by-gone days made murder not only justifiable but righteous, has at times almost depopulated the island; and though now put down by the government with a strong hand, there are still occasional outbreaks of savagery that carry one back to that early period when the philosopher Seneca inveighed in no flattering terms against the barbarians amongst whom he was condemned to spend eight dreary years of banishment.

It is not astonishing that the folklore of such a people is full of interest to the student, and that a rich harvest may be gathered from the national songs and ballads, the quaint tales and curious legends that abound. The wild *voceri*, too, or funeral dirges, are often strangely pathetic, and recall in some degree the wailing chants and lamentations of the ancients at the funeral obsequies of their dead. There is scarcely a male amongst the hardy mountaineers who cannot sing these songs, or relate stories of giants and fairies, of saints or the devil—the latter plays an important part in most Corsican folk-tales—or who is not able to rouse the enthusiasm of his attentive audience by narrating some stirring incident of the wars the island has had to sustain against the Saracens or the Genoese, for the memory of these long-past struggles for freedom is ever fresh in the minds of the people.

When the summer days are ended and the vintage is over—when the shepherds have brought down their flocks and herds from the upper pastures of the mountains—when the autumn evenings begin to grow chilly and damp, and it is no longer the season for outdoor amusements—then the villagers are accustomed to gather together in one house rather larger, perhaps, than its neighbours, to pass the hours in friendly intercourse. A huge log burns in the wide open chimney, its fitful flames ever and anon illuminating the dark corners of the room, or throwing strange distorted shadows on the raftered roof; the frugal supper of chestnuts is roasting amid the embers; the pitcher of home-made wine circulates freely; and while the young people laugh and jest, the women knit, and the men discuss the result of the day's sport or fishing, the incidents of the last *vendetta*, or the latest exploits of some well-known brigand. Then there is a pause; the conversation flags, and some one calls upon the *raconteur* of the party: 'Suppose you tell us a story—*una fola*?'

We can picture the scene; it is like a study of Rembrandt; the circle of eager faces lit up by the ruddy glare of the great log, and in the centre the old man, leaning forward, his clasped hands resting on the table, his eyes shut in concentrated thought; silence reigns, except for the clinking of glasses, the click-click of the women's needles, the crackling of the burning wood, and the occasional 'pop' of a chestnut, or the outbursts of merry laughter at some spicy anecdote or well-turned jest.

There is no more laughter-loving being than the Corsican peasant. With him no subject is too sacred to be provocative of mirth; a witty epigram or a good story will often turn aside his anger; and if by chance a priest should come off the worst in it, well, so much the better; for in spite of his superstition, there is a levity and lack of reverence in his composition that leads him to make a scoff of sacred things. Many of these folk-tales, indeed, are more than irreverent, and often border on the profane; others, again, as is not unnatural if we consider the intellectual and social condition of the people, are too coarse for the delectation of ears polite; but from the collection before us, published by Maisonneuve & Co., in their series of 'The Popular Literature of all Nations,' we shall endeavour to cull a few specimens typical of the style of narrative most in vogue.

In some of the so-called 'fairy tales' it is curious to trace a resemblance to much of the familiar nursery lore of our childhood. Cinderella appears—though under another name—and dazzles the Prince with her beauty at a ball which he gives on three consecutive nights. She vanishes each night at the same hour by the help of her fairy godmother, leaving not a trace behind, and is only discovered at last through a ring that the Prince has given her, and which she kneads into a cake and sends to him by the hands of her waiting-woman. Then, too, we might almost suppose that the Arabian Nights' Entertainment had penetrated into the mountains of Corsica, as we read of the poor peasant Stevanu who discovers the secret of the brigands' treasure-cave in the depths of a vast forest. The magic words 'Serchia, uncloze!' remind us of the 'Open Sesame' that brought wealth and prosperity to Ali Baba, and the sequel of the story is no less familiar. The robbers, finding themselves robbed in their turn, seek to discover by means of a ruse the man who has most speedily grown rich in the neighbouring village. Disguised as an itinerant dealer in olive oil, their chief drives before him his mules; the foremost of these are laden with great jars filled with oil; but in each of the last six jars a brigand lies concealed. A night's lodging is solicited at the house of Stevanu; the chief has a room assigned to him, and the jars containing his merchandise are left in the kitchen. But Stevanu's suspicions have been aroused by the unusual weight of some of the jars; he guesses the stratagem, and orders his servants to heat a caldron of oil, which he proceeds to pour over the six robbers. Their chief is soon overpowered and killed; and Stevanu is left in undisputed possession of all their ill-gotten gains.

The quaint vein of humour running through some of these popular tales reminds us strongly of old Æsop's Fables. Bastelica is now a fairly prosperous village in Corsica, of some three thousand inhabitants, who would probably one and all resent the imputation that their mental calibre is below the average; yet, for some occult reason, from time immemorial the very name 'Il Bastelicacciu' has been held as a synonym for 'fool'; and shouts of ironical laughter will reward the narrator as he tells the well-known story of the man of Bastelica who once upon a time possessed a wife and a mill. The mill

brought him in next to nothing; but his wife—there are perhaps few just like her—thought her good man could do nothing wrong. Said the miller, then, one day: 'Let us sell our mill; it hardly earns us bread; while if we only had a cow, she would supply us with fresh milk and butter, and maybe a calf, which we could sell with profit.'

'Thou art right as ever,' replied his wife; 'let us sell the mill.'

So the miller sold it for six hundred francs, and with this money he purchased a cow at the neighbouring fair, and started merrily on his homeward way. He had not travelled far, however, before he began to feel fatigued.

'I was stupid,' thought he, 'to buy this cow; some day she may toss me with her horns and kill me; whereas a horse would always be useful. He would carry me on my journeys; and a little grass would suffice for his food.'

Just then, a man on horseback passed that way, and an exchange was soon effected. The animal was of no great value, certainly; but for a time the miller rejoiced over his bargain. Then he began to reflect: 'A horse will be of little use to me, for I cannot ride all day; assuredly, a goat would serve my purpose better.'

A shepherd coming along readily gave the finest goat of his flock for the miller's horse. Our Bastelicacciu was not yet satisfied, however; the goat was sold for twenty francs; the twenty francs bought a hen and her brood of chickens; these in their turn were disposed of for a sack of potatoes. But the way was long and the potatoes were heavy; so the miller, in a fit of anger, tumbled sack and all into the nearest stream, and finally reached home empty-handed.

'And the cow, where hast thou put her?' asked his wife.

'Oh, I exchanged her for a good horse; and then, as the horse would not always be useful to us, I chose instead a fine fat goat, that might supply us daily with fresh milk.'

To the wife's query, 'Where was the goat?' our friend related how the goat was disposed of, how he bought the hen and chickens, how these were replaced by the sack of potatoes, which was finally emptied into the stream.

'Thou hast done wisely,' quoth the good woman. 'Such a heavy load might perchance have crushed thee by its weight.' And so, quite contentedly, the miller and the miller's wife went supperless to bed; and the story-teller adds a moral à la Æsopian method: 'May every youth one day possess such a treasure of a wife as this; but Heaven preserve the maidens from marrying a Bastelicacciu!'

It is not only the nursery tales of our childish days, however, that reappear in these popular *foli* of the Corsican peasantry; many other familiar stories have somehow found their way into the wild mountains and wooded valleys, and are curiously interwoven with threads of local colouring. Shakespeare might be a name unknown to the swarthy herdsman; but tell him the story of King Lear, and of the fatuous decision that brought his life to so pitiful an end, and his dark eyes will flash and his mobile features kindle with interest as he gives you its counterpart from his store of legends, save and except the tragic sequel of the play. Here, also,

he will tell you the king has three children, two daughters and a son. Feeling the approach of old age and its infirmities, he summons them before him, and declares his intention of dividing among them his kingdom and all his wealth; but first of all desires to know the measure of their affection. The eldest daughter vows that she loves him more than her life, that for his sake she would renounce her hopes of Heaven. The son in his turn declares that his affection for his father outweighs his desire to reign in his place, that to please such a parent he would throw himself, if need be, into a fiery furnace. Then comes the old king's youngest daughter, his favourite child, and, like Cordelia, she makes no extravagant protestations, but modestly says that she loves him as a dutiful and affectionate daughter ought to love so kind a father. This reply enrages the infatuated king, and he orders her out of his sight. Marie wanders away in the disguise of a shepherdess, and meets with many wonderful adventures before the inevitable Prince comes to her rescue; but she steadfastly refuses to marry him unless her father can be present at the ceremony. Meanwhile, however, the poor old king has been so cruelly ill-treated by his unnatural children that he has lost his reason; and it is only after many months of tender care and loving attention that Marie's devotion is rewarded, and the king regains his throne. Then the wicked son and daughter are punished as they deserve; Cordelia's prototype is married, and everybody lives happily ever after.

We have spoken hitherto of the popular folk-tales, or of those in which may be traced a resemblance to stories familiar to us from our childhood. If we turn now to the class of legends properly so called, we shall see how deep a vein of superstition runs through the nature of the true-born Corsican. Not even the superstitious Irish peasant can have a firmer belief in the 'good people' whom he sees dancing in the pale moonlight by the edge of a lonely bog, or beneath the green shade of the forest trees, than has the hardy mountaineer of this wild, half-civilised island in the fairies supposed to haunt some gloomy grotto or rocky cave. It may be by the side of a little mountain lake, half hidden by the overhanging cliff, or in the dim recesses of some wild forest but rarely trodden by the foot of man, that the fairy has made her home; it matters little; but her presence there is as certain, her personality as real to the credulous villagers, as were ever the dryads and nymphs of old to the cultured imaginative Greeks and Romans. From time to time she appears in human form to some favoured mortal; but vanishes out of sight if he dare venture on too familiar an approach.

How much or little of these wild fancies may have owed their origin to the myths of ancient Rome would now be impossible to determine; but it is curious to trace in some few lingering superstitions a vague resemblance to certain rites and ceremonies that were familiar to the Romans from earliest times, and which would doubtless have been introduced by them into the lands they conquered. When Corsica became a Roman province, heathen temples were erected here and there, in which the augurs were wont to pro-

pitiate the gods by sacrifices, or to foretell future events through such mystic signs as the flight of birds and the entrails of beasts. Of these dim remembrance still exists in the practice of sooth-saying by means of bones. The fortune-teller will take the left shoulder-blade (scapula) of a goat or sheep, and in the vague lines or marks upon its polished surface pretend to read the destiny of the person who seeks his aid. That the left shoulder-blade alone is efficacious is proved by an old proverb, '*la destra spalla sfalla*' (the right one deceives). Many famous Corsicans are said to have had their fortunes told by means of the scapula, the most noteworthy example being that of Napoleon I. When the future Emperor was a child, an old herdsman of Ghidaggio renowned for his skill in augury examined the scapula one day, and saw depicted there a forest tree rising straight and tall with wide-spreading branches, but scanty and feeble roots. From this he foresaw that a Corsican would one day rise to honour and renown, and would become a mighty ruler for a time; but that his reign, though glorious, would be short and his overthrow complete.

Omens and portents are firmly believed in, and probably nowhere are ghosts treated with such profound respect as in Corsica. Many a stalwart peasant who would not flinch before the onslaught of an enemy, who is brave in battle, untiring in the chase, will shrink and tremble in abject terror if compelled to traverse a burial-ground at dead of night. Should a sudden death occur in the village, there will not be wanting those who will tell you with scared looks and bated breath that they at least were prepared to hear the sad tidings, for did not the *malucella*—a bird of evil omen, somewhat resembling the banshee of Irish folk-tales—utter its wailing cry three nights in succession over the roof of the dead man's house, and was not the sound heard of a muffled drum beaten by invisible hands upon its doorstep? In this class there is one specially grim superstition which relates to the *Squadra d'Arrozza* (the Brotherhood of the Dead). It is supposed to consist of those whose earthly career was ended long ago, but who still retain a semblance of the duties they were once called upon to perform. Before the death of some exalted personage, just at the midnight hour they sweep, a ghostly train, through the silent streets, each phantom form concealed beneath a monkish cloak and cowl, and bearing lighted tapers in their hands. Not a sound is heard as this gruesome mockery of a funeral procession passes by, but woe betide the unfortunate individual who may chance to cross its path: let him beware lest the spectres surround him unawares; in such a case he is surely lost, but if he preserve his presence of mind and keep a firm front, they will disappear at earliest cockcrow, and thus he may know the warning is not meant for him.

We might easily multiply these instances of strange credulity, and quote many more of the quaint superstitions, that, handed down as they are by word of mouth from father to son, have grown into the very hearts of the people; but enough has been told to show how far behind his contemporaries the Corsican peasant still is in the scale of civilisation. After all, is he on that account an object of unmixed pity? Surely

not. When we think how slight an impression the 'education of the masses' can ever make upon the squalid misery that throngs the courts and alleys of our great cities, we may be content to leave to the simple-hearted mountaineer his myths and fancies, since they are nurtured by the very conditions of the untrammelled life he leads amidst the wild scenery and beneath the blue cloudless skies of his beautiful island home.

ÆSTHETIC BIRDS.

SOME little time ago a naturalist called the attention of the public to a pair of goldfinches which had made use of the blossoms of the blue forget-me-not to form a border to their nest, thus showing both appreciation of colour, and taste for art. Darwin, indeed, has attributed much of the beauty of the plumage of birds, those loveliest of Nature's children, to their innate love of colour and beauty of form, which has tended to improve and perfect the various ornamental colours and appendages adorning the winged denizens of forest and woodland, whether in the tropics or in more temperate climes.

Leaving the difficult and complex, although most interesting subject of bodily adornment to be treated of by professed naturalists, we would call attention to a few less known instances of the æsthetic tastes of birds, which, as leading sometimes to theft and cruelty, can hardly be said to redound to their credit.

The fact has long been recognised that many birds are fond of glittering objects. The raven, the magpie, jackdaw, and many other British birds will steal and hide anything which pleases the eye, using the stolen goods sometimes in the adornment of their nests, perhaps for the gratification of their youthful progeny; but birds kept in captivity will often make a secret hoard of glittering things, apparently for their own special gratification. Many instances are on record of rings, spoons, chains, &c., supposed to have been stolen, having been found after months or years, in the hiding-place to which they have been conveyed by some favourite bird, or in some cases by rats, which seem to share the æsthetic tastes of 'feathered fowl.'

The ostrich when domesticated will snatch at buttons, rings, thimbles, or anything shining, and swallow it—a propensity shared by the crane and some other large birds requiring hard substances to assist the process of digestion. Mrs Martin in her amusing book, *Home Life on an Ostrich Farm*, tells a story of an ostrich which snatched and swallowed a valuable diamond pin, upon which a council was held as to which was the most valuable, the bird or the diamond; and as it was during the time when ostriches realised fabulous prices, the bird's life was spared, and he was allowed to retain his prize. It has been proved that ostriches in the Zoological Gardens have been killed by swallowing the pence presented to them by a curious and injudicious public. But in their wild state there does not appear to be any special fondness for glittering objects; at least no instances are recorded of any accumulated hoard of shining stones or other bright-looking substances in or around

the nests of these birds; otherwise, the nests of ostriches would have been frequently searched in expectation of finding in them diamonds and gold.

The most remarkable instance of æstheticism among birds is that exhibited by the Australian bower-birds, who build long galleries in which to play, adorning them with shells, feathers, leaves, bones, or any coloured or glittering object which comes in their way. Captain Stokes described one of these bower-birds as taking a shell alternately from each side of the bower and carrying it through in its beak. Lumholtz describes several of these play-houses of the bower-birds; he says they are always to be found 'in small brushwood, never in the open field; and in their immediate vicinity the bird collects a mass of different kinds of objects, especially snail-shells, which are laid in two heaps, one at each entrance—the one being always much larger than the other. There are frequently hundreds of shells, about three hundred in one heap and thirty in the other. There is usually a handful of green berries partly inside and partly outside the bower.' He also in his interesting book, *Among Cannibals*, describes a play-ground of what would appear to be a different species of this bird, showing even greater æsthetic taste. 'On the top of the mountains I heard in the dense scrubs the loud and unceasing voice of a bird. I carefully approached it as it sat on the ground, and shot it. It was one of the bower-birds, with a gray and very modest plumage, and of the size of a thrush. As I picked up the bird, my attention was drawn to a fresh covering of green leaves on the black soil. This was the bird's place of amusement, which beneath the dense scrubs formed a square about a yard each way, the ground having been cleared of leaves and rubbish. On this neatly-cleared spot, the bird had laid large fresh leaves, one by the side of the other, with considerable regularity; and close by he sat singing, apparently extremely happy over his work. As soon as the leaves decay they are replaced by new ones. On this excursion I saw three such places of amusement all near each other, and all had fresh leaves from the same kind of trees, while a large heap of dry withered leaves was lying close by. It seems that the bird scrapes away the mould every time it changes the leaves, so as to have a dark background, against which the green leaves make a better appearance. Can any one doubt that this bird has the sense of beauty?'

'The satin bower-bird,' says Darwin, 'collects gaily-coloured articles, such as the blue tail-feathers of parrakeets, bleached bones and shells, which it sticks between the twigs or arranges at the entrance. Mr Gould found in one bower a neatly-worked stone tomahawk and a slip of blue cotton, evidently procured from a native encampment. The bower of the spotted bower-bird is beautifully lined with tall grasses so disposed that the heads nearly meet; and the decorations are very profuse. Round stones are used to keep the grass-stems in their proper places, and to make divergent paths leading to the bower.'

In all these birds the collection of beautiful objects appears to be simply for ornament, the gratification of æsthetic taste at the cost of much labour; and this taste for the beautiful

would seem to be common to all birds from the lordly ostrich to the tiny humming-bird, which, according to Mr Gould, adorns its nest with bits of coloured lichen and pretty feathers.

There is, however, another species of bird which unites cruelty with its love for the beautiful. This is the butcher-bird, which here in England adorns the thorns around its nest with bees, flies, and other small insects, and even young birds, thus providing for itself, as it would seem, a variety of meat hung till tender, or even a little 'high,' to suit its gastronomic tastes; and hence its name. But it seems doubtful whether these things are intended to serve as food; in some cases they are certainly impaled simply to gratify the æsthetic taste of the cruel little executioner; and it has been noticed that the insects chosen are usually of a bright colour or lustrous in appearance. In countries where gaily-coloured insects abound, this is particularly noticeable; and in South Africa the cruel thorns of the mimosa are adorned with bright-hued beetles, locusts, humble-bees, small birds, and frogs, and sometimes little snakes or lizards, marking the home of the butcher-bird.

Thunberg says: 'Fiscal and Canary-byter were the appellations given to a black and white bird (*Lanius collaris*) which was common in the town, and was to be found in every garden there. As it was a bird of prey, though very small, it sought its food among the insects, such as beetles and grasshoppers, which it not only caught with great dexterity, but likewise, when it could not consume them all, it would stick them upon the pales of farmyards till it had occasion for them, so that one would have supposed them to have been impaled in this manner by human beings. It also caught sparrows and canary birds, but did not devour any more of them than the brains.'

Here we see this little Elagabalus, the dainty epicure, killing birds to regale himself upon their brains, and impaling the corpses in order to enjoy the beauty of colour, changing his wild habits to accommodate himself to town-life, and making use of the pointed stakes set up as fences in gardens and farmyards, instead of the thorns of his native habitat. A similar instance is recorded in America, where, upon the vast prairies of late years, barbed wire fences have been erected; and, there being no thorn-bushes near, this little bird-demon has taken possession of the cruel barbs and used them for his butcheries. For yards, we are told, these iron barbs are hung with beetles, small snakes, and birds, all generally impaled alive; whilst the barbarous little executioner sits on the pole supporting the wire chirping and hopping about in evident enjoyment of the raree-show he has made. His especial delight appears to be a beetle possessing scarlet gauzy wings; this he always impales in a certain manner, which causes the scarlet under wing to drop from the outer wing-case, the bright colour being evidently a great attraction.

The curious thing is that these butcher-birds, or 'shrikes,' living as they do in so many widely-separated lands, should possess everywhere the same æsthetic proclivities and the same adaptability. Whenever they are found in their native wilds, they cover the thorns in the immediate neighbourhood of their nest with their victims; but when they are drawn within the boundary of

human handiwork, they do not scruple to put the resources of civilisation to their own use, thus as it were throwing upon man the burden of their evil deeds. They seem to say in bird language: 'You call us cruel; but why do you place the instruments of cruelty so temptingly before us? You cut down the thorns, but supply their places with spikes and barbs, which are the same as thorns to us, since we can use them for ornamental purposes.'

Tennyson sings of 'Nature red in tooth and claw;' but he has not credited birds of prey with the love of beauty; yet the raven, the magpie, the jay, and the shrike or butcher-bird show as much appreciation of colour and brightness as the bower-bird and the lark, which may be lured from his song at 'heaven's gate' by the glitter of a bit of glass on the greensward; and we may imagine that the hawks were proud of the bells and trappings with which they were adorned by the falconer of old, and attracted by the lure held out to them. Almost all land-birds show something more than architectural skill in the construction of their nests. In the choice of material and the mode of arrangement, the artistic element is often apparent; but with water-birds this is generally wanting. Their nests are rudely constructed, consisting sometimes of only a little hollow scraped in the sand; nevertheless the surroundings, whether by accident or design, are often very beautiful. What can exceed the beauty of a swan's nest embowered in tall reeds and lined with the lovely down from her own breast? But she does not appear to require or desire any foreign adornment, and certainly does not attempt to line her bower with leaves and berries; nor, as far as we recollect, does any sea-bird adorn its habitation with its glittering prey, like the butcher-bird. Their life is probably too hard, and their surroundings too wild, to allow of care for mere ornament; but they need not, therefore, be deficient in æstheticism, although it is less apparent than in the more familiar birds of forest and woodland.

WHEN ROSES BLOW.

WHEN Roses blow, you will return to me,
True heart! across the glad blue summer sea;
And we through quiet paths again shall stray,
Or loiter in the old, fond, foolish way,
To read the names you cut upon a tree,

What time you said: 'Love, I am bound to thee
In such sweet thrall that nought can set me free,
And our two lives shall be made one for aye
When roses blow.'

Now, while pink blossoms flush the grassy lea,
And wood-birds sing, and winds for very glee
Shake over all the land the sweet white May,
I watch the stately ships come in, and say:
'Please God, how bright and fair my world will be
When roses blow.'

THE WORLD-OLD YEW.

THERE are two kinds of trees peculiarly interesting, by reason of the rich historical and poetical associations which surround them. One, the Oak, we personify as 'King of the Woods'; the other, the Yew, we tenderly plant where our lost loved ones rest. Much that is ennobling in our thoughts is associated with them. The oak is ever to us an emblem of strength, majesty, and courage; the yew, of sorrow, immortality, and gloom. Our poets have often used them to embellish their word-pictures and point their precepts; and our historians have told us with pride of the parts played by their branches, shaped to 'good yew bows' and 'oaken walls' in our country's hours of need. No other trees are so closely connected with our national life and history as the oak and the yew, and the story of their lives is full of interest and instruction. To the latter we wish here more particularly to refer.

The yew (*Taxus baccata*) is indigenous to nearly every country in Europe, being found as far north as the Gulf of Finland, and south to the shores of the Mediterranean. Botanically it belongs to the natural order Coniferae, or Pines, in which family many of the most useful and ornamental trees are classed. The flowers are dioecious—that is, with the staminate and pistillate organs on different trees. It is the oldest of British trees, specimens being still alive which, according to De Candolle, are not less than two thousand years old. In many places throughout the country, especially in the west of England and in Wales, we may still stand beneath the flourishing branches of yews which were nearly full grown at the time of the Conquest. At Aldsworth, in Berkshire, there is still living a yew which measures at the present time twenty-seven feet in circumference, and must be at least one thousand years old. This fine tree is referred to in More's *Berkshire Queries*, under the date 1760, where it is recorded that it was 'nine yards in girth.' So that for at least one hundred and

thirty years it has not increased in size. At Bucklebury, in the same county, stands another time-scarred patriarch, which also measures twenty-seven feet in girth where the branches spring from the trunk.

An interesting group of fine yews exists at Watcombe, on the road from Hungerford to Oxford. The trees are planted in the shape of a cloister court with a pond in the centre, on the site of a pre-Reformation religious edifice connected with the Benedictine Monastery of Huxley, to which house it was given by Geoffrey de Mandeville about 1086 A.D., and referred to in the 'Pipe Rolls' under the date 1166 A.D. The enclosure is still called, by the people of the district, 'Paradise,' the origin of which name can now only be conjectured. It is probably a relic of some ancient monastic symbol. The same name is given to other groups, such as those at Gresford, near Chester; at Chichester, and at Winchester.

A fine pair of trees standing together a little to the rear of the group at Watcombe are known as 'Adam and Eve,' and represent, according to the local legend, our first parents driven out of Paradise. They are of the male and female species, while the foliage of 'Adam' is of a darker shade than that of his companion 'Eve.' Standing still farther from the group is a solitary specimen twenty feet in circumference, which, in the emblematic language of the legend, is the 'Serpent.' This tree shows the effects of time more than any of the others, the trunk being now nearly reduced to a shell, though the top growth is still flourishing. A lateral opening in the trunk is large enough to afford standing-room for six or eight persons.

At Iffley, near Oxford, may be seen an ancient tree, whose furrowed half-prostrate trunk seems 'weary worn with care;' and as we stand beside its bending form, a feeling of sympathy, akin to that which we extend to a fellow-being stooping low with a load of years, rises within us. This yew is considered by competent judges to be the oldest living tree in Britain, and must have been

full-grown long before the first Oxford spire was raised in the vale below.

The largest and finest yew in Scotland is at Craighends, Renfrewshire. It is of a conical shape, and being a comparatively young tree, is in a most vigorous condition. It covers an area of about two hundred and fifty feet in circumference, and rises to a height of forty feet. The bole is eight feet in diameter. This is a grand specimen, and worthy of a visit by any one who appreciates the sublime beauty of trees, and finds in their presence that 'soothing companionship' which Oliver Wendell-Holmes so eloquently praises. There is also a fine group of yews, forming a noble avenue, near the church at Roseneath, on the Gareloch. It stands not far distant from the grand silver firs which are the largest of their kind in the kingdom.

From a geological point of view also, the yew is an interesting tree. We find its trunks in a surprising state of preservation, imbedded in the remains of British forests which flourished long anterior to historic times. On the Norfolk coast near Cromer, and in the remains of the vast forest which existed where the waters of the Bristol Channel now roll, gnarled yew-trunks have been discovered in recent times side by side with the bones of animals which must have been similar in size and form to the elephant and rhinoceros of the present day. It has also been turned up in the bogs of Ireland and Scotland, in the fens of the eastern counties of England, and among the 'moor-logs' submerged at the mouth of the Thames.

At a very early date, the yew was associated with the ideas of sorrow and immortality. We know that the Egyptians used it as a symbol of mourning, and its use in this way seems to have passed from them to the Greek and Roman nations. The early Britons probably learned to attach a funereal signification to it from their Roman conquerors, and the idea has descended from them to us. The reason of its employment in this typical sense is now difficult to trace. Very likely it arose from the characteristic aspect of the tree. To an age ever ready to express its thoughts by symbols, the sombre foliage would suggest the idea of gloom, and its almost unchanging aspect, alike in summer's sunshine and winter's storm, would produce that of immortality.

From an economic point of view the yew is now of little value. When every English army had its contingent of archers its branches supplied wood for bows. By an Act of Edward IV., every Englishman was compelled to procure a bow of his own length, made of yew, wych-hazel, or ash. At one time the wood, which is susceptible of an extremely fine polish, was much used in cabinet-making. It is now, however, very little employed in this way, other kinds of timber having been found more serviceable.

Besides being largely planted in cemeteries, the yew is extensively used as an ornamental tree, on lawns and in shrubberies, its distinctive, erect form, and dark glossy evergreen foliage, making a pleasing contrast to trees of a more spreading habit and with foliage of a lighter shade. In the days when arboriculture was very much a science of clipping, and trees and shrubs were tortured into such fantastic shapes as the figures

of various birds and animals, teapots, pyramids, cones, tables, chairs, and even of human beings, the yew, on account of its dense twiggy habit of growth, and patience under such unnatural treatment, was much used. Some wonderful examples of this kind of tree-culture may still be seen; but happily the fashion is now almost extinct, and the yew, like its fellow-victims the box and juniper, is allowed to assume its natural form.

Our poets make many beautiful and apt allusions to the yew, which seems to have been an interesting object to them. In *Twelfth Night*, Shakespeare refers to its use at funerals: 'My shroud of white, stuck all with yew;' and in *Macbeth*, 'the slips of yew silver'd in the moon's eclipse,' point to the well-known poisonous nature of the leaves, as well as to the awe with which the tree was regarded. Tennyson, in *In Memoriam*, refers to the yew's gloom and unchanging aspect in the well-known verses:

Old Yew, which graspest at the stones
That name the under-lying dead;
Thy fibres net the dreamless head,
Thy roots are wrapped about the bones.
O! not for thee the glow, the bloom,
Who changest not in any gale;
Nor branding summer suns avail
To touch thy thousand years of gloom.

In *The Holy Grail*, also, the Laureate makes a beautiful reference to the yew, in his usual accurate manner:

As they sat
Beneath a world-old yew-tree darkening half
The Cloisters, on a gustful April morn
That puffed the swaying branches into smoke
Above them, ere the summer when he died,
The monk Ambrosius questioned Percivale:
'O! brother, I have seen this yew-tree smoke,
Spring after spring for half a hundred years.'

The gusty April morn puffing the branches into smoke is a fine poetic touch, and is strictly true to Nature, although it is an incident not often noted, even by keen observers of Nature's signs and moods. The 'smoke' is the fine dusty pollen produced by the flowers of the male species shaken from the anther-cells by the wind.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXVII.—THE LESSON OF THE STREET.

'CHILD,' said the Master, 'it is time that you should take another lesson.'

'I am ready. Let us begin.' She crossed her hands in her lap and looked up obedient.

'Not a lesson this time from books. A practical lesson from men and women, boys and girls, children and infants in arms. Let us go forth and hear the teaching of the wrecks and the slaves. I will show you creatures who are men and women mutilated in body and mind—mutilated by the social order. Come. I will show you, not by words, but by sight, why Property must be destroyed.'

It was seven o'clock, when Mr Dering ought to have been thinking of his dinner, that Mr

* Copyright 1892 in the United States of America by Harper & Brothers.

Edmund Gray proposed this expedition. Now, since that other discourse on the sacredness of Property, a strange thing had fallen upon Elsie. Whenever her Master spoke and taught, she seemed to hear, following him, the other Voice speaking and teaching exactly the opposite. Sometimes—this is absurd, but many true things are absurd—she seemed to hear both voices speaking together: yet she heard them distinctly and apart. Looking at Mr Dering, she knew what he was saying: looking at Mr Edmund Gray, she heard what he was saying. So that no sooner had these words been spoken, than, like a response in Church, there arose the voice of Mr Dering. And it said: 'Come. You shall see the wretched lives and the sufferings of those who are punished because their fathers or themselves have refused to work and save. Not to be able to get Property is the real curse of labour. It is no evil to work provided one chooses the work and creates for one's self Property. The curse is to have to work for starvation wages at what can never create Property, if the worker should live for a thousand years.'

Of the two voices she preferred the one which promised the abolition of poverty and crime. She was young: she was generous: any hope of a return of the Saturnian reign made her heart glow. Of the two old men—the mad man and the sane man—she loved the madman. Who would not love such a man? Why, he knew how to make the whole world happy! Ever since the time of Adam we have been looking and calling out and praying for such a man. Every year the world runs after such a man. He promises, but he does not perform. The world tries his patent medicine, and is no better. Then, the year after, the world runs after another man.

Elsie rose and followed the Master. It was always with a certain anxiety that she sat or talked with him. Always she dreaded lest, by some unlucky accident, he should awaken and be restored to himself suddenly and without warning—say in his Lecture Hall. How would he look? What should she say? 'See—in this place for many years past you have in course of madness preached the very doctrines which in hours of sanity you have most reprobated. These people around you are your disciples. You have taught them by reason and by illustration with vehemence and earnestness to regard the destruction of Property as the one thing needful for the salvation of the world. What will you say now? Will you begin to teach the contrary? They will chase you out of the Hall for a madman. Will you go on with your present teaching? You will despise yourself for a madman.' Truly a difficult position. Habit, however, was too strong. There was little chance that Edmund Gray among his own people, and at work upon his own hobby, would become Edward Dering.

They went out together. He led her—whither? It mattered not. North and South and East and West you may find everywhere the streets and houses of the very poor hidden away behind the streets of the working-people and the well to do.

The Master stopped at the entrance of one of those streets—it seemed to Elsie as if she was standing between two men both alike with different eyes. At the corner was a public-house with swinging doors. It was filled with men

talking, but not loudly. Now and then a woman went in or came out, but they were mostly men. It was a street long and narrow, squalid to the last degree, with small two-storeyed houses on either side. The bricks were grimy; the mortar was constantly falling out between them: the woodwork of doors and windows was insufferably grimy: many of the panes were broken in the windows. It was full of children: they swarmed: they ran about in the road, they danced on the pavement, they ran and jumped and laughed as if their lot was the happiest in the world and their future the brightest. Moreover, most of them, though their parents were steeped in poverty, looked well fed and even rosy. 'All these children,' said Mr Edmund Gray, 'will grow up without a trade: they will enter life with nothing but their hands and their legs and their time. That is the whole of their inheritance. They go to school, and they like school: but as for the things they learn, they will forget them, or they will have no use for them. Hewers of wood and drawers of water shall they be: they are condemned already. That is the system: we take thousands of children every year, and we condemn them to servitude—whatever genius may be lying among them. It is like throwing treasures into the sea, or burying the fruits of the earth. Waste! Waste! Yet, if the system is to be bolstered up, what help?'

Said the other Voice: 'The world must have servants. These are our servants. If they are good at their work, they will rise and become upper servants. If they are good upper servants, they may rise higher. Their children can rise higher still, and their grandchildren may join us. Service is best for them. Good service, hard service, will keep them in health and out of temptation. To lament because they are servants is foolish and sentimental.'

Standing in the doorways, sitting on the doorsteps, talking together, were women—about four times as many women as there were houses. This was because there were as many families as rooms, and there were four rooms for every house. As they stood at the end of the street and looked down, Elsie observed that nearly every woman had a baby in her arms, and that there were a great many types or kinds of women. That which does not surprise one in a drawing-room, where every woman is expected to have her individual points, is noticed in a crowd, where, one thinks, the people should be like sheep—all alike.

'A splendid place, this street, for such a student as you should be, my Scholar.' The Master looked up and down—he sniffed the air, which was stuffy, with peculiar satisfaction: he smiled upon the grubby houses. 'You should come often: you should make the acquaintance of the people: you will find them so human, so desperately human, that you will presently understand that these women are your sisters. Change dresses with one of them: let your hair fall wild: take off your bonnet'—

'Shall I then be quite like them?' asked Elsie. 'Like them, Master? Oh! not quite like them.'

'Not quite like them,' he said. 'No; you could never talk like them.'

He walked about among the people, who evi-

dently knew him, because they made way for him, nodded to him, and pretended, such was their politeness, to pay no attention to the young lady who accompanied him.

'Every one of them is a study,' he continued. 'I could preach to you on every one as a text. Here is my young friend Alice Parden, for instance'—he stopped before a pale girl of seventeen or so, tall and slender, but of drooping figure, who carried a baby in her arms. 'Look at her. Consider. Alice is foolish, like all the Alices of this street. Alice must needs marry her chap a year ago, when she was sixteen and he was eighteen. Alice should be still at her club in the evening and her work in the daytime. But she must marry, and she is a child-mother.—Is he out of work still?' Alice nodded, and hugged her baby closer. Mr Edmund Gray shook his head in admonition, but gave her a coin, and went on. 'Now, look at this good woman'—he stopped before a door where an Amazon was leaning—a woman five feet eight in height with brawny arms and broad shoulders and a fiery furnace for a face—a most terrible and fearful woman.—'How are you this evening, Mrs Moss? And how is your husband?'

Long is the arm of coincidence. Mrs Moss was just beginning to repose after a row royal; she was slowly simmering and slowly calming. There had been a row royal, a dispute, an argument, a quarrel, and a fight with her husband. All four were only just concluded. All four had been conducted on the pavement, for the sake of coolness and air and space. The residents stood around: the controversy was sharp and animated: the lady bore signs of its vehemence in a bruise, rapidly blackening, over one eye, and abrasions on her knuckles. The husband had been conducted by his friends from the spot to the public-house at the corner, where he was at present pulling himself together, and forgetting the weight of his consort's fists, and solacing his spirit with strong drink.

'How is my husband?' the lady repeated. 'Oh! I'll tell you. I'll tell you, Mr Gray, how my husband is. Oh! how is he? Go look for him in the public-house. You shall see how he is and what he looks like.' She descended two steps, still retaining the advantage of the lowest. Then, describing a semicircle with her right arm, she began an impassioned harangue. The residents fled, right and left, not knowing whether in her wrath she might not mistake the whole of them, collectively, for her husband. The men in the public-house hearing her voice, trembled, and looked apprehensively at the door. But Mr Gray stood before her without fear. He knew her better than to run away. The lady respected his courage, and rejoiced in a sympathetic listener. Presently she ran down: she paused: she gasped: she caught at her heart: she choked: she wept. She sat down on the doorstep, this great strong woman, with the brawny arms and the fiery face, and she wept. The residents crept timidly back again and gathered round her, murmuring sympathy: the men in the public-house trembled again. Mr Gray grasped her by the hand and murmured a few words of consolation; for indeed there were great wrongs, such as few wives even in this street expect, and undeniable provocations. Then he led his Scholar away.

At the next house he entered, taking Elsie with him to a room at the back where a woman sat making garments. She was a middle-aged woman, and though very poorly dressed, not in rags: the room was neat except for the garments lying about. She looked up cheerfully—her eyes were bright, her face was fine—and smiled. 'You here, Mr Gray?' she said. 'Well, I was only thinking yesterday how long it is since you came to see me last. I mustn't stop working, but you can talk.'

'This is a very special friend of mine,' said the Master. 'I have known her for ten years, ever since I began to visit the street. She is always cheerful: though she has to live on sweating work and sweating pay. She never complains. She lives like the sparrows, and eats about as much as a sparrow: she is always respectable. She goes to Church on Sundays: she is always neat in her dress. Yet she must be always hungry.'

'Ah!' said the woman, 'you'd wonder, Miss, if you knew how little a woman can live upon.'

'Oh! but,' said Elsie, 'to have always to live on that little!'

'She is the daughter of a man once thought well to do.'—'He was most respectable,' said the woman.—'He died, and left nothing but debts. The family were soon scattered, and—you see—this street contains some of those who have fallen low down as well as those who are born low down. It is Misfortune Lane as well as Poverty Lane. To the third and fourth generation, misfortune, when it begins—the reason of its beginning is the wickedness of one man—still persecutes and follows the family.'

'Thank you, Miss,' said the woman. 'And if you will come again sometimes— Oh! you needn't be afraid. No one would hurt a friend of Mr Gray.' So they went out.

On the next doorstep and the next and the next, there sat women old and young, but all of these had the same look and almost the same features—they were heavy-faced, dull-eyed, thick-lipped, unwashed, and unbrushed. 'These,' said the Master, 'are the women who know of nothing better than the life they lead here. They have no hope of rising: they would be unhappy out of this street. They bear children: they bring them up, and they die. It is womanhood at its lowest. They want warmth, food, and drink, and that is nearly all. They are the children and grandchildren of women like themselves, and they are the mothers of women like themselves. Savage lands have no such savagery as this, for the worst savages have some knowledge, and these women have none. They are mutilated by our system. We have deprived them of their souls. They are the products of our system. In a better order these people could not exist: they would not be allowed parents or birth. The boy would still be learning his trade, and the girl would be working at hers. That little woman who meets her troubles with so brave a heart has been sweated all her life—ever since her misfortunes began: she takes it as part of the thing they call life: she believes that it will be made up to her somehow in another world. I hope it will.'

'All these people,' said the other Voice, 'are what they are because of the follies and the

vices of themselves and their fathers. The boy-husband has no trade. Whose fault is that? The rickety boy and the rickety girl bring into the world a rickety baby. Whose fault is that? Let them grow worse instead of better until they learn by sharper suffering that vice and folly bring their punishment.'

'You see the children,' continued the Master, 'and the mothers. You do not see any old men because this sort mostly die before they reach the age of sixty. Those who are past work and yet continue to live go into the House. The girls you do not see because those who are not forced to work all the evening as well as all the day are out walking with their sweethearts. Nor the men because they are mostly in the public-house. They are all hand-to-mouth working men: they live by the job when they can get any. When they are out of work, they live upon each other. We hide this kind of thing away in back streets like this, and we think it isn't dangerous. But it is. Formerly, the wreckage huddled together bred plagues and pestilences, which carried off rich and poor with equal hand, and so revenged itself. In other ways, the wreckage revenges itself still.'

'This kind of people,' said the other Voice, 'may be dangerous. We have a Police on purpose to meet the danger. They would be quite as dangerous if you were to give them free dinners and house them without rent. The class represents the untamable element. They are always a danger. To cry over them is silly and useless.'

They walked down the street. Everybody knew Mr Edmund Gray. He had a word for all. It was evident that he had been a visitor in the street for a long time: he had the air of a proprietor: he entered the houses and opened doors and sat down and talked, his disciple standing beside him and looking on. He asked questions and gave advice—not of a subversive Socialistic kind, but sound advice, recognising the order that is, not the order that should be.

All the rooms in this street were tenanted, mostly a family to each. In many of them work was going on still, though it was already eight o'clock. Sometimes it would be a woman sitting alone in her room like a prisoner in a cell, stitching for dear life: sometimes three or four women or girls sitting all together, stitching for dear life: sometimes a whole family, little children and all, making matches, making canvas bags, making paper bags, making card-boxes, all making—making—making for dear life. And the fingers did not stop and the eyes were not lifted, though the visitors opened the door and came in and asked questions, to which one replied in the name of all the rest.

It is an old, old story—everybody knows the slum: people go to gaze upon it; it is one of the chief sights of Victorian London, just as a hundred and fifty years ago it was one of the sights to see the women flogged at Bridewell. Not such a very great advance in civilisation, perhaps, after all.

'It is a hive—the place is swarming with life,' said the girl, who had never before seen such a street.

'Life means Humanity. All these people are so like you, my Scholar, that you would be surprised. You would not be like them if you

were dressed in these things, but they are like you. They want the same things as you—they have the same desires—they suffer the same pains. What makes your happiness? Food—warmth, sufficiency, not too much work. These are the elements for you as well as for them. In my system they will have all these—and then perhaps they will build up, as you have done, an edifice of Knowledge, Art, and Sweet Thoughts. But they are all like you. And most in one thing. For all women of all classes, there is one thing needful. These girls, like you, want love. They all want love. Oh, child! they are so like you, so very like you—these poor women of the lowest class. So very like their proud sisters.' He paused for a moment. Elsie made no reply. 'You see,' he continued, 'they are so hard at work that they cannot even lift their eyes to look at you—not even at you, though they so seldom see a girl among them so lovely and so well dressed. One would have thought—but there is the Whip that drives—that dreadful Whip—it hangs over them and drives them all day long without rest or pause. Their work pays their rent and keeps them alive. It just keeps them alive, and that is all. No more. It must be hard to work all day long for another person—if you come to think of it. Happily, they do not think. And all this grinding poverty—this terrible work, that one family may be able to live in a great house and to do nothing.'

'They are working,' said the other Voice, 'because one man has had the wit to create a market for their work. His thrift, his enterprise, his clearness of sight, have made it possible for these girls to find the work that keeps them. If they would have the sense not to marry recklessly, there would be fewer working girls, and wages would go up. If their employer raised their wages only a penny a day, he would benefit them but little and would ruin himself. They must learn—if they can—the lesson of forethought by their own sufferings. No one can help them.'

As Mr Edmund Gray walked into the houses and out again Elsie went with him, or she waited outside while he went in. Sometimes she heard the chink of coin: sometimes she heard words of thanks. The Socialist, whatever he taught, practised the elementary form of charity possible only for those who have money. Elsie remarked this little point, but said nothing.

'What you see here,' said the Master, 'is the lowest class of all—if one ever gets to the lowest level. For my own part, I have seen men and women so wretched that you would have called them *miserrimi*—of all created beings the most wretched. Yet have I afterwards found others more wretched still. In this street are those who make the lowest things: those who can make nothing, and have no trade, and live on odd jobs: and those who can neither make nor work, but thief and lie about.'

'I see all that; but, dear Master, what will your new order do for such people? Will it make those who will not work industrious?'

'It will give every producer the fruits of his own labour: it will teach a trade to every man, and find men work. And those who cannot work, it will lock up until they die. They shall have no children. Perhaps it will kill them all. It might be better. We will have no human failures

in our midst. That street is full of lessons, all calling aloud for the destruction of Property.'

Then the other Voice spoke: 'The presence of the human failure is a lesson always before us—a warning and a lesson to rich and poor alike. As he is, so all may be. None are so rich but they may be brought to poverty: none so poor but they may be poorer. So far from hiding away the wreckage, it is always in our sight. It prowls about the streets: we can never escape it. And it fills all hearts with terror: it spurs all men to industry and invention and perseverance. The human failure inspires a never-ending hymn in praise of Property.'

TRIAL OF THE PYX.

It is one of the many privileges, so abundant in our favoured land, that we are entitled to a genuine coinage. In the first of the witty and ingenious *Drapier Letters*, written by Swift in 1724 against the copper coinage, which the English government was then introducing into Ireland, he refers to an observation by Lord Coke upon a certain act of parliament as far back as the reign of Edward I. 'By this act,' says that learned authority, 'it appears that no subject can be forced to take in buying or selling or other payment, any money made but of lawful metal, that is, of silver or gold.' From this Swift reasoned, somewhat extravagantly, that Irishmen were fully justified in refusing to take 'Mr Wood's halfpence' under any circumstances whatever. Without, however, discussing the position of the Dean of St Patrick's with regard to the ironmaster's 'filthy trash,' as he called it, the privilege of British subjects which he quotes is undoubtedly of the highest importance. The advantage of possessing a reliable medium of exchange is felt in all commercial transactions of whatever degree; and the disadvantage of its absence is experienced in a slight measure when, in spite of Lord Coke, one is hoodwinked by a 'smasher' into the acceptance of a counterfeit coin. This is happily of rare occurrence, so that the bitter feelings usually aroused on such occasions should eventually end in profound thankfulness to our ever-glorious Constitution which secures the life of the honest tradesman from a frequency of such vexations.

In this connection, it may be of interest to know that systematic precaution is taken to ensure that the coin circulating in this realm is 'made but of lawful metal,' not only for individual satisfaction but for national credit, so that English money may be, as we believe it is, 'firmamentum belli et ornamentum pacis.' The character of the coins issued from Her Majesty's Mint is examined year by year at the 'Trial of the Pyx,' as it is called. On this occasion, a jury of not less than six 'competent freemen' of the Goldsmiths' Company are empanelled at the Goldsmiths' Hall to verify the weight and fineness of the gold and silver coinages of the past twelve months. They are sworn before the Queen's Remembrancer, who points out the importance of their task. They are then handed the pyx coins, which it is their duty to weigh and assay and report upon. These coins consist of pieces that have been taken out during the year,

impartially, one from each journey weight or bag of finished work before it is delivered by the Mint to the Bank. When the coins are selected, they are placed in a packet which is sealed with the Mint seal and carefully locked in the pyx or chest (whence the phrase, 'Trial of the Pyx') until the time appointed for the trial, which generally takes place early in July.

The duties of the jurymen are very clearly defined by an Order in Council dated the 29th June 1871. They have to ascertain that the number of coins in each packet corresponds with the number represented to be there by the officers of the Mint, who are to be in attendance at the Hall. Each coin must be weighed to show whether it is within the prescribed 'remedy' or legal allowance as to weight. They are to take some of the coins and melt them into an ingot, which they must assay and compare with the standard trial plate in the custody of the Board of Trade. Some of the remaining pieces they must assay separately, in order to discover whether each coin is of the millesimal fineness specified by the Coinage Act, 1870, or its partial amendment, 1891. They are then to formulate their verdict in writing, and deliver the same to the Queen's Remembrancer, from which copies are made for the Lords Commissioners of the Treasury, the Board of Trade, and the Mint, and also for publication in the *London Gazette*.

Though the verdicts since 1871, when the trial was first held annually, have been satisfactory, the imperative necessity of some such appeal to a legal standard will be recognised when it is considered that a slight deficiency on each piece becomes a serious amount in a large coinage. For instance, if the gold coined in 1890 (nearly eight millions) had been issued only one per mil. below the standard assay, that is, containing 913.6 parts of gold instead of 914.6 per 1000, the lowest legal proportion, it would mean a loss of upwards of £8500. And if every sovereign had weighed a grain too little, that is, 122.074 instead of 123.074 grains, the lowest legal weight, the total deficiency would have been nearly £65,000.

Evidently this offers a ready if not a righteous mode of replenishing the royal treasury chests. And it is a notorious historical fact that very few, if any, of our impecunious monarchs have been immaculate in respect to this temptation. Silver coins are said to have been first debased in the time of Edward I., and from his reign downwards they have varied in approximation to the normal weight and standard according to the necessities of the throne. The spendthrift Henry VIII. reduced the silver pound (in tale) from eleven oz. two dwt. of silver and eighteen dwt. of alloy, which has been the standard composition from Saxon times to the present, to four oz. of silver and eight of alloy. And this proportion was actually decreased by Edward VI. to three oz. of silver and nine of alloy in the Troy pound. After such flagrant debasements, 'Good Queen Bess's' little scheme of coining sixty-two shillings instead of sixty to the pound is scarcely worth mentioning. In the reign of Queen Anne, the guinea, which was originally issued as a twenty-shilling piece, was raised in nominal value to thirty shillings. And at the same period, W. Lowndes, in his 'Report for the Amendment of Silver Coins, London, 1695,' makes

a general complaint of 'lackage' in the weight of the currency. As an instance, he refers to 572 bags of silver money weighed at the receipt of the Exchequer. It appears from his statement that the 'medium' (mean) weight of each £100 by tale was 198 oz. 18 dwt. $\frac{1}{2}$ gr., showing a 'medium' deficiency of 188 oz. 3 dwt. $21\frac{1}{2}$ gr. from the Mint standard, or nearly one-half the correct weight. *Tempora mutantur!* What would a modern pyx jury say to this?

And this disgraceful condition of the coinage cannot be excused through want of balances to weigh closer than half a piece. For it is on record that, before this, in the reign of Charles I., the Attorney-general, Noy, on seeing the accuracy of the beam employed, exclaimed with a burst of candour, unusual in an astute lawyer, 'I should be loth that all my actions should be weighed in these scales.' If we may not conclude from this that their balances indicated the thousandth part of a grain as at present, it is only fair to the machines to suppose that they were not used to weigh the coins that got into Mr Lowndes' hands. And a very probable hypothesis of the defalcation is that wickedness existed somewhere in the high places.

Though, however, the examination of the pyx is, *ipso facto*, a means of security to the nation, it must not be supposed that it originated with the people as a check upon the king. On the contrary, it originated with the king as a check upon those who held the contract for coining his money. For until 1850 the coinages were actually executed by the Moneyers, a private firm who claimed 'the prescriptive right to coin all Her Majesty's moneys.' The Mint Master was the officer held responsible to the sovereign by written indentures, which gave him explicit directions and particulars as to the coinage. And the trial of the pyx, held at the will and pleasure of the Crown, was a formal inquiry into his integrity in fulfilling those indentures. If the pyx coins proved good in weight and fineness, the master of the Mint was released from his responsibility; but any violation of the contract was severely dealt with. Cases are on record in which moneyers convicted of counterfeiting the coins were condemned to be hanged, drawn, and quartered; and, for less flagrant offences, they had to lose the right hand.

It is not improbable, from documentary evidence, that this inquiry was first instituted in the reign of Henry II. (1154-1189). At anyrate, in the ninth or tenth year of Edward I., the king commanded the barons of the Exchequer by writ to take with them the warden of the Mint and open the boxes of the assay at London and Canterbury, and make the assay in such a manner as the 'king's council is wont to do.' But in 1345 we have an undoubted reference to the trial of the pyx; for the terms of the indenture between Edward III. and Percival de Perche are still in existence; and the mode of the 'tryall' is given in detail. As soon as the moneys were 'coyned and compleate,' one piece was to be taken from every five-pound weight of gold, and kept in a chest with two keys and sealed with two seals, the one to remain with the king's deputy, and the other with the master. The box was to be opened every three months before the council of the king, the warden and the master being present,

and the moneys to 'bee assaid before them, and being found good and convenable, the said master to have letters pattents for his discharge, and being found otherwise the master to pay the kinge or his deputy that which shall apperteyne.' This is precise enough; and in the Cotton manuscripts there is an account of an assay of gold nobles, five years later, 1352, when they were compared with some florins of Florence kept in the Treasury as standards. The Egerton papers of the time of Elizabeth contain an 'order of ratinge of thassaies of the Mynte in the realme of Englande by the Queene's Majesties most Honourable Counsell in the Star-chamber of oulde tyme.' And it is recorded by the old chroniclers that on May 9, 1611, James I. was present as usual at the trial of the pyx in the Tower of London, and that the 'English Solomon' diligently 'viewed and examined the state of his Money and Mint.'

The intervals between these trials has been of considerable variation. Edward III., as has been quoted, caused them to be made every three months; but in general they were held just when the state pleased, sometimes at the appointment of a new master, that the old one might receive his quietus, and sometimes when the coinage reached a certain amount. The trial of the pyx in 1799 was held after a period of four years, and when about seven millions had been coined. But when the actual manufacture of money was brought under direct government control in 1870, the Coinage Act of that year enacted that 'For the purpose of ascertaining that coins issued from the Mint have been coined in accordance with this act, a trial of the pyx shall be held at least once in every year in which coins have been issued from the Mint.' The superior advantage of this more frequent check upon the officers of the Mint is obvious, and should be sufficient to inspire the most widespread confidence.

THE BELLS OF LINLAVEN.

CHAPTER III.—COMING SHADOWS.

BRATHRIG BECK falls into Brathrig Mere; and there, under the shelter of the broad brown Fell lies the little village of Linlaven, with the church-tower standing forth above the trees, and the blue lake stretching out beyond, filling every creek and bend of the shore with its brimming waters.

The place is lovely in its solitude, with the great hills girdling it round and shutting it in. It might be the Happy Valley of Rasselas: for the clamour and tumult of life reach it not. It is warmed by the sunshine, and beaten upon by storms; but the sound of the great world beyond comes not anigh. Yet, alas! though these guardian hills may beat back and keep afar off the roaring tide of life as it surges through the streets of great cities and around the high places of mankind, they cannot wholly shut it out. Its ebb and flow make themselves felt here, even in this the shallowest backwater of the ocean of humanity. Its pulsations come and go amid these solitudes with as rhythmic a beat as in the lanes of London City. And how? Because the human heart is here. Which is as much as to say, that love is here, and hate; that

joy is here, and grief; that here are pain and passion and despair, sin and death and the grave.

And that old man, weary and worn and fever-stricken: what would he here amid these solitudes in the wild October storm of yestereven? Thought he that Nemesis, awful daughter of Night, knew not her way hither? Saw he not the church-tower of Linlaven rising there amid the trees?—At its feet is the green churchyard, full of the graves of men.

The storm of yesternight had died away upon the hills, but it had left mournful traces of its fury behind. High up on the broad Fell, many a tall pine has been shattered and riven, lying now with upturned roots in the wan morning light. The old elm that yestermorn shook its withered boughs, rustling dim dead leaves in the rising sun, has fallen across the village street, and the children stare with round eyes of wonder at its hollow bole, knowing not that corruption and decay had been eating into its heart for years. The great willow that hung over the deep still pool where Brathrig Beck falls into Brathrig Mere, is also stricken down; nor shall it ever again fan the air with gray leaves, and whisper dark secrets to the summer moon, of fair pale faces and floating hair, and midnight shrieks along the mere.

A very little thing moves the half-stagnant waters of life in a village community. Had the storm of last night been the only troubler of the waters, it would doubtless this morning have been the talk and wonder of every one; the old folks counting how far back it was since they had had such another storm, and how much worse that was than this one; and the young folks wondering how it was that people could remember things so far back: *they* could hardly remember yesterday's lessons.

But now, the finding of the stranger upon the moor far outdid all other subjects of human interest. Rafe the pedlar, who had discovered him with that inquisitive lantern of his—which was always glaring about with its one eye to see if it couldn't pick up a bargain—Rafe was quite a hero to-day. He had to tell the story a dozen times in the course of the forenoon; but he managed to make rather a profitable business out of it. The old women found he was not very communicative upon the subject until they had sampled and paid for a few of his wares, and then it was amazing what he could tell. The wild wind, the swaying and moaning of the trees by the Dead Water, the awful terror he experienced in passing the tree where the smugglers hanged the exciseman, and then, to crown all, the groans and strange sounds he heard when at last he reached the brow of the Fell, and saw the corpse-like thing lying before him! But further than that he would not go. He might say more than his head was worth. Who knows who the old man might be? No, no; Lawrence Dale and he had talked the matter over, and least said soonest mended. 'But maybe, kimmers, when I come round next, the sough may hae blawn past, and wha kens what I may tell ye, ance I can do it wi' safety, and just out o' pure friendship. Sae, good-day, i' noo.'

Upon the whole, the result was rather disappointing to the gossips; but Rafe knew he had

planted a little seed of curiosity and expectancy in their minds that would keep them from forgetting him till he came back again.

In the course of the forenoon the Doctor arrived at the vicarage. The patient had in the meantime, by the Vicar's orders, been removed to a room in a cottage near the mill, where Lawrence Dale and his wife had promised to see to his wants; and thither the Vicar and the Doctor bent their steps. Clara, in whose mind a strange curiosity had been stirred as to the old man, accompanied them, and looked anxiously at the Doctor's proceedings. The patient was in much the same condition as she had last seen him; and the Doctor pronounced him to be suffering from what appeared to be brain-fever, due, in view of the circumstances under which he had been found, to fatigue and exposure, and possibly privation.

Before she left the room, Clara whispered to the Vicar: 'Grandpapa, go forward and look at the poor man; do you think you could ever have seen him before?'

The Vicar did so, looking long and anxiously at the man's face. 'No,' he said, as he returned to her side. 'I am certain I never saw him before, nor am I able to see anything in his features that resembles any one I have ever known.'

Clara did not reply; but her mind was not quite at rest. She did not, however, say anything about what she had seen and heard in the early morning; and they left the house together.

No perceptible change occurred in the patient's condition during that or the following day; but in the early hours of the third morning, while Lawrence and Mrs Dale were sitting with him, some symptoms of a change made themselves manifest. The strugglings of the crazed brain within the man were subsiding; his voice had sunk almost into silence, though there was still a death-like pallor on his face. By-and-by he sank into what appeared to the sympathetic watchers to be a calm and peaceful slumber. Was it, thought they, the blessed sleep that precedes a healthful awakening, or was it the comatose languor that should end in death?

It was Sabbath morning, and Clara visited the cottage on her way to church. The village was as calm and silent as the great brown hills that looked down upon it on every side. No tinkle of hammer on anvil came from the village smithy; the six days' rumble and whirl of shaft and pinion in the old mill was at an end, and the big water-wheel stood up gaunt and idle, lazily dripping in the morning sun. Brown leaves lay thick along the margin of the lake, on the smooth steely surface of which the church and church-tower were impictured as in a mirror. The little flower-plot in front of the cottage wore a lifeless and dejected look, as if sadly conscious that its summer glory was over and gone; and from the trailing roses and creepers that still clung to the cottage wall, the yellow leaves every now and again fell with a faint shiver to the ground.

Clara entered, and was struck by the strange stillness that filled the room, and the slumberous quiet of the apparently dying man. The sunlight came slantingly in at door and window—not rich and mellow as in the golden glow of summer, but with a cold and silvery splendour,

that gave lustre but little warmth to the chill October air. The chirp and twitter of birds upon the housetops, or the slow heavy footsteps of a passing villager, was all that broke the silence; and there, beneath the eyes of the silent watchers, the sick man calmly slumbered on.

All at once the sound of the church bells broke upon the quiet air, entering with the sunlight the open door, and startling the sleeper where he lay. He moved at first uneasily, as in pain; then lay like one who sleeps, yet seems to listen in his sleep. The bells rang on, their clangour softened by distance; the rich melody filling the air and flooding the room as with the rush and rustle of angels' wings.

No one spoke. The sleeper moved once more, and looked up. The wild light had died out of his eyes, and the harsh lines of his face were softened and subdued as if an angel's hand had touched them into peace. It was life—not death. The battle had been fought, the tribulation had been endured, and the hand of the Destroyer had been stayed—for a time.

'Them beautiful bells!'

It was the sick man who spoke, his face for the moment lit up with a kind of sweet radiance. At length his eyes fell on Lawrence. 'Where be I?' he asked; 'and what beautiful bells be those?'

'Thou be among friends,' Lawrence replied; 'and the bells are the bells of Linlaven.'

'Ah,' said the man, as if the words conveyed no information to his mind. Then he lay quite still for a few minutes, apparently absorbed in his own thoughts; perhaps considering within himself the possibilities that might have occurred. And again he spoke.

'Happen that some one ha' took me up. I knowed I was out in the dark night, in the storm, well nigh a-dyin' of hunger and weariness and pain—and then I feels myself falling and falling—and knowed that this were the end o' me at last. Then all of a sudden I was far away in the old church at home, kneeling by mother's side, and the great bells in the tower were ringing out slowly and sweetly, and all the church was filled with sunshine and pleasant music, as I ha' seen it many and many's the time long ago. Mother took my hand in hers as I knelt beside her, and I could see the old look of love deep down in her eyes. "Giles, my lad, say *Our Father*." And I said it with her till we came to *Forgive us our sins*—when it all changed, quick and sudden-like, into darkness. I could not lift my eyes, and a great pain was at my heart, and all around was nothing but darkness—darkness! Then my eyes were opened, and I saw thee beside me here—and them beautiful bells, they still rang on. What may it all mean?'

'It means,' said Lawrence, 'that thou ha' been very ill, and ha' had a sore wrastle for thy life. But ask no more at present; thou will hear all when thou be stronger.'

Clara all this while had stood a little apart, strangely moved by what she saw and heard, comparing her former impressions with her present. Then she moved quietly out of the house, and took her way to the church.

'Lawrence,' said Mrs Dale to her husband apart; 'I ha' been thinkin' o' that thou told

me as to what the poor old man said up on the Fell, and I can't believe it. It were main bad of us to think ill o' him. That ain't the face of a bad man, whatever is.'

The autumn had passed into winter, and winter into spring, and the old man whom Rafe the pedlar had found on Brathrig Fell on that stormy night last October was still in Linlaven. He did not die. His recovery was slow, but, thanks greatly to the patient nursing of Mrs Dale, he did recover.

'Uncle Giles.' That was the name he was known by. He had never offered to give his full name to any one, and no one among those about him quite cared to ask him for it. He was excessively fond of children, and they of him; and one day a little girl, with that innocent temerity which sits so well on childhood, asked him what his name was. The man looked taken aback for a minute; then he replied, that the little children he had known in other places always called him Uncle Giles. And so he came to be called in Linlaven, not by the children only, but by every one.

All the same, it was a little strange, this reticence and this desire for obscurity. As you may be sure, it did not escape the attention of the villagers. It was indeed much talked of—in his absence. There must be some reason for it. Was he 'wanted?' What would it be? Theft? No, he did not look like a man who would steal. Murder? Never; he was too gentle and mild even to have given deadly injury to any one. Smuggling? Ah, that might be it. For it was observed that he was not what is called poor. After his recovery, he had himself paid the doctor's bill, and ever since he had been indebted to no one for the simple necessities of his life. That must be it: smuggling. And once the villagers arrived at this conclusion, it was rather an element in his favour than otherwise.

But this suspicion was not all; for Mrs Dale thought she saw more. She had satisfied herself that, immediately after his recovery, he desired nothing more than to get away from Linlaven as quickly as possible. He was restless, and anxious, and evidently bent upon taking his departure. And in all probability he would have been gone long ere now, but for the fact that the winter had been a singularly severe one. It was quite a month after his being carried into Linlaven before he was able to leave his bed, and yet another month before he was in a fit state to travel; by which time the winter had set in, fierce and keen. Great falls of snow had taken place, and the hills lay stretched motionless under their white shrouds like so many dead giants. The roads for weeks were blocked, and it was not possible to cross the wild Fells in any direction. Winter had in fact besieged Linlaven, shutting it up as closely as was ever beleaguered city in time of war.

This old man, therefore, who called himself Giles, was to Lawrence Dale and his wife, as also to the Vicar and Clara, not only the object of much kindly attention but also of some degree of interest. At first they had simply pitied and cherished him as a poor child of misfortune and distress, driven by the vicissitudes of fate within

the scope of their sympathies; but as they knew him better, they began at once to like and to respect him. He was a man of few words, manifesting his sense of gratitude in his looks and manner rather than by any set form of speech.

But there was one that got nearer to the old man's heart than all the rest. This was Lucy Norham, Clara's child. A merry prattling thing, with all the winning ways of a little sylph of five years, she came to know and to understand him as if by intuition, and to love him also as the very young are often seen to love the very old. She it was who had had the hardihood to look up into the old man's face and to ask him his name. She would transport into his cottage the little play-things that were dearest to her for the time, and spend hours at the old man's feet, until her nurse appeared to fetch her home. Sometimes, as she sat on his knee, her fair hair falling over her shoulders, he would stroke with gentle hand the shining locks, and gaze into the deep blue of her young eyes, as though he were about to recall in her face some vanished image of the past. And when, in the course of that fierce mid-winter—when fog and frost and snow lay everywhere, and icicles hung from windows and doorways—disease laid its hand on the little maid, not one of all the villagers waited for news of her recovery with a deeper anxiety than did this ancient castaway who loved her.

Moreover, as the spring returned, and the soft west winds were once more rippling the lake, life seemed to have grown brighter for the old man. It was found that he possessed no slight mechanical skill in various ways; and in order to encourage him to settle in the village, Lawrence Dale had the top-storey of the Old Grange fitted up with a carpenter's bench and other requisites, and Uncle Giles soon found his hands filled with such work as the united wants of the little community provided for him. Here, therefore, the old man bestowed himself in his working hours, and here, when the spring sun shone soft on the vicarage garden, scarce a day would pass in which he was not aware of a pair of little feet climbing the tall stairs, and a little voice shouting out for 'Uncle Giles.' Then would he leave his tools, and go half-way down the stairs to lift the little Lucy in his arms, and carry her up beside him, to watch him at his work, and to cheer him by her happy innocence and childish prattle.

With this improvement in the old man's physical surroundings had come also a corresponding improvement in his health and appearance. As strength returned to his tall and naturally athletic frame, and his step became firmer, and his face less pale and emaciated, the neighbours were fain to admit that he did not look quite so old as they at first had thought him. It was true his hair was gray—even white; but we know that time is not alone the producer of gray hairs. There are other snows than those of age: other frosts that whiten men's heads—ay, and blench men's hearts too—than those that fall from the chill breath of passing years.

The spring had grown into summer, and now June was almost treading on the skirts of May. The leaf had returned to the tree, and the meadows were green with the springing grass. Down the lanes the hawthorn was white with

flowers, and the scent of blossoming orchards was sweet on the air. Amid all this, the old man, with his recovered health and strength might have been as happy and contented as most of his neighbours deemed him; but he was not. This discontent, or rather restlessness, was not apparent to outsiders; but there was one whose keen yet kindly eye did not fail to discern it, and that one was Lawrence Dale's wife, Milly. With a woman's fine instinct, she saw that he was urged by the old mysterious impulse to arise and depart from among them.

When these fits were on him, he would wander for hours about the distant margin of the lake, and through sequestered lanes, shunning, and evidently desirous of shunning, the presence of his neighbours. He had come back one evening from one of those solitary wanderings, and was seated on the bench outside his cottage door, looking across the shining mere to where the great sun was glowing in the western sky. A thrush, on the topmost twig of the leafy elm that overhung the cottage roof, was making all the air musical with its rich mellow notes, only keeping silence at intervals for the reply which came back to it from that other in the clump of leafy beeches below. But the old man heeded not their music. His face wore a look of deep sadness, as he sat there, gazing at the lake with its wavy flow of golden-crested ripples. Was he thinking of the future?—or of the past? Thinking, it may be—who knows?—of both: of the time, perhaps, when, under the black sails of some withering sorrow or deed of sin, he had scoured the seas in search of that dragon which he was never to slay, and in the hope of returning under the white sails of that victory which had never been his.

At that moment a little hand was laid on his, causing him to start suddenly, like a man in fear. It was only the little maid Lucy.

'I have come to bid you good-night, Uncle Giles; and Dolly have come too. You must kiss Dolly first, 'cause she's the pincirpal baby.' And she held a very much battered little image of a doll up to him. 'Oh, Uncle Giles,' she went on, 'Dolly and I have been looking for you for hours—and hours—and hours!' And she gazed up into his face with wistful eyes.

The old man only said, 'Ah, my little Lucy!' and gathered her up into his long arms, and set her on his knee. As he kissed her, a hot drop fell upon her cheek. Just then, he looked up and saw Milly watching him from her cottage door; so, kissing the child once more, he set her down, and went hurriedly into his own house.

His confused and agitated demeanour had not escaped Milly's eye; hence, as soon as she had taken Lucy up to the vicarage, and returned, she walked straight towards his house, and entered. It was as she had half expected. The worn brown valise stood packed on the table, as if its owner were meditating an early departure.

'Surely, Uncle Giles,' Milly said, pointing to the valise, 'thou be not going to leave us?'

'Happen I may, missus,' he answered, as he lifted the tell-tale bundle and put it away. He went on: 'I shouldn't oughtn't to ha' been here so long. Only one thing ha' kept me, or I ain't nowise sure if I had been wi' thee till now.'

'What is that, Giles?'

'Well, missus, it be that bairn o' Mrs Norham's—little Lucy. There's a summat that binds that lass to me as I can't explain nohow, not even to mysen.'

'Then why should thou go? Ain't thou well here, and well liked?'

'Happen as that be so,' he replied. 'I weren't complainin' o' no one. But mine ha' been a wanderin' life; and though I be well pleased to stay within sound o' Linlaven bells, yet happen sometime I may stay a day too long. I ain't a-wishin' to go; but maybe, lass, there's a summat as shall make me.'

HEREDITARY CLERGYMEN.

It has not yet been proved, though Mr Galton has attempted to do so, that genius and ability are qualities capable of being transmitted from father to son. But it is frequently seen that for several generations families have followed one particular profession, and as they have often done so with considerable success, it is to be presumed that they inherited abilities that peculiarly adapted them for the hereditary calling. There are families that can, and do, boast of their four or five successive generations engaged in the law or medicine or trade. The clerical profession has been particularly favoured in this direction, almost every religious denomination having had families who for generations have devoted themselves to the ministerial or sacerdotal functions. A very prominent family among the Jews, the Adlers, have long held high rank in their church. In the last century flourished the Rabbi Beer Adler. He was father of Mordecai Adler, Chief Rabbi of Hanover, whose son, the Rev. Dr Nathan Adler, was for a great number of years Chief Rabbi of England. Dr Nathan Adler's son, Dr H. Adler, having been for some years Delegate Chief Rabbi of England, has now succeeded his father. Thus four generations of the Adler family have held the Rabbinate; and a passage in the will of Dr Nathan Adler points to there being still another generation in the person of the son of the present Chief Rabbi, carrying out the priestly traditions of the family.

In the Church of Rome, the celibacy of the clergy prevents the direct transmission of the priestly office; but there are numerous families—for instance, the Vaughans, to which the Archbishop of Westminster belongs—in which one or more members of several generations have become clergymen. An exception to the general rule of celibacy in the Romish Church is the case of the semi-secular Deans of Whalley, whose marriages would appear to have been considered quite legal, and who were hereditary clergymen in every sense, the Deanery going to the eldest son, just as a civil title does at the present time. This family was for eight generations connected with the Deanery of Whalley, the line ceasing in the thirteenth century.

The Church of England has had many examples of clerical families. In some cases these families, having inherited the presentation of a living, have, very naturally, brought up one of their members in holy orders to keep the benefice in the family. In others, doubtless, a strong theological bias has almost forced its members

to enter the Church; and it has even been suggested that these clerical families have inherited from their ancestors sermons, and thus having a good stock of these essentials, have chosen the preaching career merely to utilise their heirlooms.

One of the oldest of the clerical families is the Collins family of Cornwall. This was founded at the Reformation by one of the earliest of the married priests, a certain Edward Collins, who was instituted Rector of Illogan in 1533. He and his descendants were Rectors of the same place for the next one hundred and fifty-one years, a break of twelve years excepted. For five generations the clerical descent of this family runs from father to son; then for two generations from uncle to nephew; then a father and son; diverging from the main line it goes for two generations from uncle to a nephew, who is now living—thus making a total of eleven generations each represented by one or more clergymen. For a period of over three hundred and fifty years some member of the Collins family has been in holy orders. The Collins family has been connected with the Church for half a century longer than the Newcome family, to which, however, it must yield the palm as regards the distinction attained by its members.

The Newcome family was established by Stephen Newcome, who in the reign of Queen Elizabeth was Curate of Gorton. He had an only son, Stephen, who became, in 1617, Rector of Caldecot. This Stephen left several children, three of whom became clergymen. From the eldest of these sons descended Daniel Newcome, Dean of Gloucester; William Newcome, Archbishop of Armagh; and a number of rectors and vicars. From the second of the three brothers also descended clergymen of the Established Church; while from the third, Henry Newcome of Manchester, the celebrated Presbyterian minister, and ejected Vicar of Gawsorth, descended a line of clergy that even now, after a lapse of a couple of hundred years, is in a flourishing condition. Henry Newcome, though himself a staunch Nonconformist, does not appear to have had any objection to his children conforming. Of his three sons, two were clergymen, Henry, the eldest son, being Rector of Middleton, Lancashire; while the youngest, Peter, became Rector of Hackney. Peter had two clerical sons, Peter, Rector of Shenley; and Richard, Bishop of St Asaph. The Rector of Shenley was father of Henry Newcome, Vicar of Gresford, who was the father of Richard, Archdeacon of Merioneth, and of Thomas, Rector of Shenley. The Rev. Thomas Newcome was father of the present Rev. H. J. Newcome, Rector of Shenley, and of the Rev. Edward W. Newcome. The present representatives of this family are thus the eighth generation of priests of the Church of England, all, it is said, holding benefices, and all, with the exception of Henry Newcome of Gawsorth and Manchester, episcopally ordained.

The Newcomes are surpassed in interest, though not in years, by the eminent family of Wesley, the first clerical member of which was Bartholomew Wesley, Rector of Catherston and Charmouth, Dorsetshire, from both of which livings he was ejected by the Act of Uniformity in 1662. Bartholomew Wesley married a grand-

daughter of Archbishop Loftus of Dublin, and had a son, John Wesley, M.A., who was also amongst the ejected ministers in 1662. His wife was of a clerical family, being daughter of the Rev. John White, and a relation of Bishops Townson and Davenant, besides being niece of Fuller, the author of the *Worthies*. The son of John Wesley was the Rev. Samuel Wesley, who, though brought up by his widowed mother with the intention of entering the Nonconformist ministry, was ordained a clergyman of the Established Church, and held the Rectory of Epworth. Samuel Wesley married the daughter of Dr Samuel Annesley, an eminent dissenting minister. Three of the sons of this marriage were clergymen—Samuel; John, the founder of Methodism; and Charles. The next generation, instead of being clergymen, were musicians; but the family profession was resumed by a grandson of Charles Wesley—namely, Dr Wesley, Chaplain to the Queen. Dr Wesley's death in 1859 terminated the clerical career of his family, he and his ancestors having been ordained priests during a period of two hundred and fifty years, the continuity of the descent being only broken by his father, Wesley the musician.

The Dodsons of Hurstpierpoint are another example. Jeremiah Dodson was for about thirty years a London rector, holding his living during the troubled times of Charles II. and James II. His son of the same name became Rector of Hurstpierpoint, in which living he was succeeded by his son, Christopher Dodson; and he in his turn by his son, John Dodson, D.D. In the next generation, Sir John Dodson deserting the family calling, held several important judicial offices, and became a Privy-councillor. Sir John's son was a few years ago created Lord Monk Bretton.

The present Bishop of Lincoln is the representative of an important family which now records its five generations of clerical descent. The first clergyman of the family was Dr James King, Dean of Raphoe in 1775; he was father of Dr Thomas King, Prebendary of Canterbury, and of Dr Walker King, Bishop of Rochester. Two of Bishop King's sons were clergymen, the elder being Archdeacon King, who was father of Canon Walker King, and of Dr Edward King, Bishop of Lincoln. Canon King's son is also in holy orders.

The King family is by no means the only family that can boast of more than one bishop. The family of Law, of which the patriarch was a country curate, can claim three bishops. The curate's son became Bishop of Carlisle in 1768. Two of the bishop's sons also attained the episcopal bench, the one as Bishop of Clonfert, the other as Bishop of Bath and Wells. The Bishop of Bath was father of Canon Law of Chester, and grandfather of several clergymen.

The Law family, with its three bishops, is scarcely to be compared, in respect to the number of its episcopal members, with the Synges of Ireland, who were perhaps the most fortunate of all the families systematically following the Church as a profession. Two brothers, George and Edward Synge, were respectively Bishops of Cloyne and Cork during the seventeenth century. In the next generation two of the sons of Bishop Edward became, the one Dean of Kildare, the other Archbishop of Tuam. The Archbishop's

two sons became Bishop of Elphin and Bishop of Killaloe. The Bishop of Killaloe died in 1771, when the episcopal honours of the family ceased, though several later members were clergymen.

In modern times there have been in England three families who have devoted themselves to the Church, and have deservedly attained high rank in it. These families are the Wilberforces, Wordsworths, and Bickersteths. The first is quite of recent clerical origin, but already includes two bishops. The second includes a Dean of Christ Church, a Bishop of Lincoln, a Bishop of St Andrews, and a Bishop of Salisbury. To the third belong the late Bishop of Ripon, the Bishop of Exeter, the Bishop of Japan; Edward Bickersteth, an evangelical preacher of considerable eminence, and the Dean of Lichfield.

The list of clerical families is by no means exhausted. Five generations of the Bisses were clergymen, the earliest being Archdeacon of Taunton in 1580; and the latest, Bishop of Hereford in 1721; while the Bests and Carsons were for five, the Woodroffes for six, and the Haringtons and Harrisons for five generations, clergymen of the Established Church.

THE CAPTAIN'S EXPLOIT.

It was a wet dreary night in that cheerless part of the great metropolis known as Wapping. The rain which had been falling heavily for hours still fell steadily on to the sloppy pavements and roads, and joining forces in the gutter, rushed impetuously to the nearest sewer. The two or three streets which had wedged themselves in between the docks and the river, and which, as a matter of fact, really comprise the beginning and end of Wapping, were deserted, except for a belated van crashing over the granite roads, or the chance form of a dock-labourer plodding doggedly along, with head bent in distaste for the rain, and hands sunk in trouser-pockets.

'Beastly night,' said Captain Bing, as he rolled out of the private bar of the *Sailor's Friend*, and ignoring the presence of the step, took a little hurried run across the pavement. 'Not fit for a dog to be out in.'

He kicked, as he spoke, at a shivering cur which was looking in at the crack of the bar-door, with a hazy view of calling its attention to the matter, and then pulling up the collar of his rough pea-jacket, stepped boldly out into the rain. Three or four minutes' walk, or rather roll, brought him to a dark narrow passage, which ran between two houses to the water-side. By a slight tack to starboard at a critical moment, he struck the channel safely, and followed it until it ended in a flight of old stone steps, half of which were under water.

'Where for?' inquired a man, starting up from a small penthouse formed of rough pieces of board.

'Schooner in the tier, *Smiling Jane*,' said the captain gruffly, as he stumbled clumsily into a boat, and sat down in the stern. 'Why don't you have better seats in this 'ere boat?'

'They're there, if you'll look for them,' said the waterman; 'and you'll find 'em easier sitting than that bucket.'

'Why don't you put 'em where a man can see 'em?' inquired the captain, raising his voice a little.

The other opened his mouth to reply, but realising that it would only lead to a long and utterly futile argument, contented himself with asking his fare to trim the boat better, and pushing off from the steps, pulled strongly through the dark lumpy water. The tide was strong, so that they made but slow progress.

'When I was a young man,' said the fare with severity, 'I'd ha' pulled this boat across and back afore now.'

'When you was a young man,' said the man at the oars, who had a local reputation as a wit, 'there wasn't no boats; they was all Noah's arks then.'

'Stow your gab,' said the captain, after a pause of deep thought.

The other, whose besetting sin was certainly not loquacity, ejected a thin stream of tobacco-juice over the side, spat on his hands, and continued his laborious work, until a crowd of dark shapes surmounted by a network of rigging loomed up before them.

'Now, which is your little barge?' he inquired, lunging strongly to maintain his position against the fast-flowing tide.

'Smiling Jane,' said his fare.

'Ah,' said the waterman, '*Smiling Jane*, is it? You sit there, cap'en, an' I'll row round all their sterns while you strike matches and look at the names. We'll have quite a nice little evening.'

'There she is,' cried the captain, who was too muddled to notice the sarcasm; 'there's the little beauty. Steady, my lad.'

He reached out his hand as he spoke, and as the boat jarred violently against a small schooner, seized a rope which hung over the side, and swaying to and fro, fumbled in his pocket for the fare.

'Steady, old boy,' said the waterman affectionately. He had just received twopence-halfpenny and a shilling by mistake for threepence. 'Easy up the side. You ain't such a pretty figger as you was when your old woman made such a bad bargain.'

The captain paused in his climb, and poising himself on one foot, gingerly felt for his tormentor's head with the other. Not finding it, he flung his leg over the bulwark and gained the deck of the vessel as the boat swung round with the tide and disappeared in the darkness.

'All turned in,' said the captain, gazing owlshly at the deserted deck. 'Well, there's a good hour an' a half afore we start; I'll turn in too.'

He walked slowly aft, and sliding back the companion-hatch, descended into a small evil-smelling cabin, and stood feeling in the darkness for the matches. They were not to be found, and growling profanely, he felt his way to the state-room, and turned in all standing.

It was still dark when he awoke and hanging over the edge of the bunk cautiously felt for the floor with his feet, and having found it, stood thoughtfully scratching his head, which seemed to have swollen to abnormal proportions.

'Time they were getting under weigh,' he said at length, and groping his way to the foot of the steps, he opened the door of what looked

like a small pantry, but which was really the mate's boudoir.

'Jem,' said the captain gruffly.

There was no reply, and jumping to the conclusion that he was above, the captain tumbled up the steps and gained the deck, which as far as he could see was in the same deserted condition as when he left it. Anxious to get some idea of the time, he staggered to the side and looked over. The tide was almost at the turn, and the steady clank, clank of neighbouring windlasses showed that other craft were just getting under weigh. A barge, its red light turning the water to blood, with a huge wall of dark sail, passed noiselessly by, the indistinct figure of a man leaning skilfully upon the tiller.

As these various signs of life and activity obtruded themselves upon the skipper of the *Smiling Jane*, his wrath rose higher and higher as he looked around the wet deserted deck of his own little craft. Then he walked forward and thrust his head down the fore-castle hatch-way.

As he expected, there was a complete sleeping chorus below; the deep satisfied snoring of half-a-dozen seamen, who, regardless of the tide and their captain's feelings, were slumbering sweetly, in blissful ignorance of all that the *Lancet* might say upon the twin subjects of overcrowding and ventilation.

'Below there, you lazy thieves,' roared the captain; 'tumble up, tumble up.'

The snores stopped. 'Ay, ay,' said a sleepy voice. 'What's the matter, master?'

'Matter!' repeated the other, choking violently.

'Ain't you going to sail to-night?'

'To-night!' said another voice in surprise. 'Why, I thought we wasn't going to sail till Wen'sday.'

Not trusting himself to reply, so careful was he of the morals of his men, the skipper went and leaned over the side and communed with the silent water. In an incredibly short space of time five or six dusky figures pattered up on to the deck, and a minute or two later the harsh clank of the windlass echoed far and wide.

The captain took the wheel. A fat and very sleepy seaman put up the side-lights, and the little schooner, detaching itself by the aid of boat-hooks and fenders from the neighbouring craft, moved slowly down with the tide. The men, in response to the captain's fervent orders, climbed aloft, and sail after sail was spread to the gentle breeze.

'Hi! you there,' cried the captain to one of the men who stood near him coiling up some loose line.

'Sir?' said the man.

'Where is the mate?' inquired the captain.

'Man with red whiskers and pimply nose?' said the man interrogatively.

'That's him to a hair,' answered the other.

'Ain't seen him since he took me on at eleven,' said the man.

'How many new hands are there?'

'I b'leeve we're all fresh,' was the reply. 'I don't believe some of 'em have ever smelt salt water.'

'The mate's been at it again,' said the captain warmly, 'that's what he has. He's done

it afore and got left behind. Them what can't stand drink, my man, shouldn't take it, remember that.'

'He said we wasn't going to sail till Wen'sday,' remarked the man, who found the captain's attitude rather trying.

'He'll get sacked, that's what he'll get,' said the captain warmly. 'I shall report as soon as I get ashore.'

The subject exhausted, the seaman returned to his work, and the captain continued steering in moody silence.

Slowly, slowly darkness gave way to light. The different portions of the craft, instead of all being blurred into one, took upon themselves shape, and stood out wet and distinct in the cold gray of the breaking day. But the lighter it became, the harder the skipper stared and rubbed his eyes, and looked from the deck to the flat marshy shore, and from the shore back to the deck again.

'Here, come here,' he cried beckoning to one of the crew.

'Yessir,' said the man advancing.

'There's something in one of my eyes,' faltered the skipper. 'I can't see straight; everything seems mixed up.—Now, speaking deliberate and without any hurry, which side o' the ship do you say the cook's galley's on?'

'Starboard,' said the man promptly, eying him with astonishment.

'Starboard,' repeated the other softly. 'He says starboard, and that's what it seems to me.—My lad, yesterday morning it was on the port side.'

The seaman received this astounding communication with calmness, but as a slight concession to appearances, said 'Lor!'

'And the water-cask,' said the skipper; 'what colour is it?'

'Green,' said the man.

'Not white?' inquired the skipper, leaning heavily upon the wheel.

'Whitish-green,' said the man, who always believed in keeping in with his superior officers.

The captain swore at him.

By this time two or three of the crew who had overheard part of the conversation had collected aft, and now stood in a small wondering knot before their strange captain.

'My lads,' said the latter, moistening his dry lips with his tongue, 'I name no names—I don't know 'em yet—and I cast no suspicions, but somebody has been painting up and altering this 'ere craft, and twisting things about until a man 'ud hardly know her. Now, what's the little game?'

There was no answer, and the captain, who was seeing things clearer and clearer in the growing light, got paler and paler.

'I must be going crazy,' he muttered. 'Is this the *Smiling Jane*, or am I dreaming?'

'It ain't the *Smiling Jane*,' said one of the seamen; 'leastways,' he added cautiously, 'it wasn't when I came aboard.'

'Not the *Smiling Jane*!' roared the skipper; 'what is it, then?'

'Why, the *Mary Ann*,' chorused the astonished crew.

'My lads,' faltered the agonised captain after

a long pause. 'My lads.' He stopped and swallowed something in his throat. 'I've been and brought away the wrong ship,' he continued with an effort; 'that's what I've done. I must have been bewitched.'

'Well, who's having the little game now?' inquired a voice.

'Somebody else 'll be sacked as well as the mate,' said another.

'We must take her back,' said the captain, raising his voice to drown these mutterings. 'All hands stand by to shorten sail.'

The bewildered crew went to their posts, the captain gave his orders in a voice which had never been so subdued and mellow since it broke at the age of fourteen, and the *Mary Ann* took in sail, and, dropping her anchor, waited patiently for the turning of the tide.

The church bells in Wapping and Rotherhithe were just striking the hour of mid-day, though they were heard by few above the noisy din of workers on wharves and ships, as a short stout captain and a mate with red whiskers and a pimply nose stood up in a waterman's boat in the centre of the river and gazed at each other in blank astonishment.

'She's gone, clean gone,' murmured the bewildered captain.

'Clean as a whistle,' said the mate. 'The new hands must ha' run away with her.'

Then the bereaved captain raised his voice and pronounced a pathetic and beautiful eulogy upon the departed vessel, somewhat marred by an appendix in which he consigned the new hands, their heirs, and descendants, to every conceivable misery.

'Ahoy,' said the waterman, who was getting tired of the business, addressing a grimy-looking seaman hanging meditatively over the side of a schooner. 'Where's the *Mary Ann*?'

'Went away at half-past one this morning,' was the reply.

'Cos here's the cap'en an' the mate,' said the waterman, indicating the forlorn couple with a bob of his head.

'My eyes!' said the man, 'I s'pose the cook's in charge then. We were to have gone too, but our old man hasn't turned up.'

Quickly the news spread amongst the craft in the tier, and many and various were the suggestions shouted to the bewildered couple from the different decks. At last, just as the captain had ordered the waterman to return to the shore, he was startled by a loud cry from the mate.

'Look there!' he shouted.

The captain looked. Fifty or sixty yards away, a small shamefaced-looking schooner, so it appeared to his excited imagination, was slowly approaching them. A minute later a shout went up from the other craft as she took in sail and bore slowly down upon them. Then a small boat put off to the buoy, and the *Mary Ann* was slowly warped into the place she had left ten hours before.

But while all this was going on, she was boarded by her captain and mate. They were met by Captain Bing, supported by his mate, who had hastily pushed off from the *Smiling Jane* to the assistance of his chief. In the two leading features before mentioned he was not unlike the

mate of the *Mary Ann*, and much stress was laid upon this fact by the unfortunate Bing in his explanation. So much so in fact, that both the mates got restless; the skipper, who was a plain man, and given to calling a spade a spade, using the word 'pimply' with what seemed to them unnecessary iteration.

It is possible that the interview might have lasted for hours had not Bing suddenly changed his tactics and begun to throw out dark hints about standing a dinner ashore, and settling it over a friendly glass. The face of the *Mary Ann's* captain began to clear, and as Bing proceeded from generalities to details, a soft smile played over his expressive features. It was reflected in the faces of the mates, who by these means showed clearly that they understood the table was to be laid for four.

At this happy turn of affairs Bing himself smiled, and a little while later a ship's boat containing four boon companions put off from the *Mary Ann* and made for the shore. Of what afterwards ensued there is no distinct record, beyond what may be gleaned from the fact that the quartette turned up at midnight arm-in-arm, and affectionately refused to be separated—even to enter the ship's boat, which was waiting for them. The sailors were at first rather nonplussed, but by dint of much coaxing and argument broke up the party, and rowing them to their respective vessels, put them carefully to bed.

SINGULAR FREAKS OF LIGHTNING.

THE Etruscans of old believed in three kinds of lightning—one incapable of doing any injury; another more mischievous in its character, and consequently only to be issued with the consent of a quorum of twelve gods; and a third carrying mischief in its train, and for which a regular decree was required from the highest divinities in the Etruscan skies. Curiously enough, modern scientists, following the lead taken by Arago, have also decreed that the varieties of lightning are threefold. The first comprehends that in which the discharge appears like a long luminous line, bent into angles and zigzags, and varying in complexion from white to blue, purple, or red. This kind is known as forked lightning, because it sometimes divides into two or more branches before reaching the earth.

The second differs from the first in the range of surface over which the flash is diffused. From this circumstance the discharge is designated sheet-lightning; and if any real parallel can be instituted between the Etruscan and modern varieties, this may be said to correspond with the innocuous lightning which any single god of Etruria could launch at his pleasure.

The third class are not only remarkable for their eccentricities, but they have been made the subject of considerable contention. They differ so widely from the more ordinary manifestations that many meteorologists have denied their right to be treated as legitimate lightnings. They neither assume the form of long lines on the one hand, nor of sheets of flame on the other, but exhibit themselves as balls or globular lumps of fire. They are not momentary apparitions, but

meteors which take their own time, and travel at such a slow rate that one flippan't gentleman characterises them as 'the Government class of lightnings.' They last several seconds, show themselves to be more than a foot in diameter, and usually burst with a bright flash and a loud explosion, occasionally discharging flashes of lightning. More than one was seen during the heavy thunder-storms of last year; and one school-master in Liverpool, whose school was struck, declared that he saw a ball of fire strike the steeple and cause the panic which ensued.

A very singular story is told concerning the vagaries of one mass of globe lightning. A tailor in the Rue St Jacques, in the neighbourhood of the Val de Grace, was getting his dinner one day during a thunder-storm, when he heard a loud clap, and soon the chimney-board fell down, and a globe of fire as big as a child's head came out quietly and moved slowly about the room at a small height above the floor. The spectator in conversation afterwards with M. Babbinet of the Académie des Sciences, said it looked like a good-sized kitten rolled up into a ball and moving without showing its paws. It was bright and shining, yet he felt no sensation of heat. The globe came near his feet; but by moving them gently aside he avoided the contact. After trying several excursions in different directions, it rose vertically to the height of his head—which he threw back, to prevent it touching him—steered towards a hole in the chimney above the mantel-piece, and made its way into the flue. Shortly afterwards—'when he supposed it had had time to reach the top,' the tailor said—there was a dreadful explosion, which destroyed the upper part of the chimney, and threw the fragments on to the roofs of some adjoining buildings which they broke through.

This explosive power is one of the foremost qualities exhibited by the electrical discharge. When the fluid happens to meet with some obstruction in its course, it frequently evinces its dissatisfaction by shattering the non-conducting object, exercising a radiating force like a bomb-shell and bursting substances asunder as if they had been charged with gunpowder. Many years ago the south-west pinnacle of the church of Breog, in Cornwall, was demolished by a stroke of lightning, and one stone weighing three hundred-weight was hurled southwards over the roof to the distance of sixty yards; while a second was sent to the north for the space of four hundred yards; and a third was projected in a south-westerly direction.

In the forest of Nemours, a tree was once struck: two pieces were rent from its trunk; the smaller was tossed to a distance of fifty feet, and the larger, which eighteen men could not move, to a distance of twenty feet or so in an opposite tack.

In 1838 the topgallant mast of H.M.S. *Rodney* was hit by a flash, and literally cut up into chips, the sea being strewn with the fragments as if the carpenters had been sweeping their shavings overboard. Shortly before, the topmasts of H.M.S. *Hyacinth* had suffered in a similar manner; and when the *Thetis* underwent a like visitation in Rio harbour, Captain Fitzroy described the foretopmast as 'a mere collection of long splinters almost like reeds.'

These are a few examples of the mechanical effects of lightning. It works chemically as well. It has the power of developing a peculiar odour, which has been variously compared to that of phosphorus, nitrous gas, and most frequently burning sulphur. Wafer mentions a storm on the Isthmus of Darien which diffused such a sulphureous stench through the atmosphere that he and his marauding companions could scarcely draw their breath, particularly when they plunged into the wood. The British ship *Montague* was once struck by globular lightning, which left such a Satanic savour behind it that the vessel seemed nothing but sulphur, and every man was suffocating. About a year ago, the newspapers recorded a similar experience of the crew of another English ship while crossing the North Pacific from China to the States. In this case the crew had to take to the rigging to prevent being choked by the sulphur fumes.

The magnetic effects produced are often very curious. A chest containing a large assortment of knives, forks, and other cutlery, was, not many years ago, struck in the house of a Wakefield tradesman, and magnetism imparted to the whole of the articles. Arago in his *Meteorological Essays* speaks of a shoemaker in Swabia whose tools were thus treated, to his indescribable annoyance. 'He had to be constantly freeing his hammer, pincers, and knife from his nails, needles, and awls, which were constantly getting caught by them as they lay together on the bench.' The same authority knew of a Genoese ship which was wrecked near Algiers in consequence of some pranks played by lightning amongst the compasses, the captain innocently supposing that he was sailing towards the north, when as a matter of fact he was steering due south.

Many other effects have been attributed to electrical commotions; but for some of these it would be hazardous to vouch. There are wells and springs which are thrown into a state of apparent ebullition on the approach of a storm. Fountains are said to pour out copious streams even in times of drought, when Jupiter 'media nimborum in nocte, corusca fulmina malitur dextra.' Subterranean thunders have occasionally been heard preparatory to an aerial eruption. The sea has cast up volumes of water, as if volcanoes were exploding below. The ground has burst open, and floods of water have gushed forth from the sides of hills or from fissures in the rocks. Taking another class of effects, cures have been performed by lightning: gouty men have been enabled to walk freely; epileptic persons have been healed; amaurosis has been removed, and rheumatism dispelled by a flash. But one dare not look too closely into the subject of medical electricity, nor venture to recommend any one to tempt lightning in the hope of experiencing its curative powers; for its action is arbitrary and oftener than not hurtful. Three hundred persons were once struck in Charleston prison and clean robbed of their muscular strength.

There is another class of phenomena produced by lightning which is well worthy of attention, but of which little is yet known; we refer to lightning-prints. We are all acquainted with

the peculiar action of light upon papers imbued with salts of silver or other chemical preparations sensitive to its influence, by which the images of surrounding objects are permanently and elegantly fixed upon paper. Well, a lightning flash now and again produces a similar result upon the thing or person it touches. M. Poey, who has treated the subject of lightning-prints very fully in the pages of the French scientific journals, mentions twenty-four cases of impressions on the bodies of men and animals. Of these, eight were impressions of trees or parts of trees; one of a bird, and one of a cow; four of crosses; three of circles or of impressions of coins carried about the person; two of horse-shoes; one of a nail; one of a metal comb; one of a number or numeral; one of the words of a sentence; and one of the back of an arm-chair. Crosses in this connection are very old, for Gregory Nazianzen declares that in the year 360 A.D. they were imprinted upon the bodies and clothing of the workmen occupied in rebuilding the Temple of Jerusalem. At the end of the sixteenth century a similar thing occurred at Wells Cathedral. Casaubon, who derived his information from Dr Still, the Bishop, says that during divine service in the cathedral two or three claps of thunder were heard, which frightened the worshippers so much that they all threw themselves on the ground. Lightning flashed without hurting any one present; but it was afterwards found that crosses had been imprinted upon the bodies of all who were in the church.

A horseshoe was found indelibly marked on the neck of a young man of Candelaria (Cuba), who was struck dead by lightning near a house upon one of the windows of which was nailed a horseshoe.

In 1853, a little girl was standing at a window near which stood a young maple-tree; a flash of lightning struck either the girl or the tree or both, and an image of the tree was found printed on her body. In another instance, a boy climbed a tree to steal a bird's nest; a lightning flash struck the tree; the boy fell to the ground, and on his breast the image of a tree, with the bird and nest on one of the branches, appeared most conspicuously.

DISCIPLINE.

CAN it be true that you have read in vain
Life's strange, sweet parable of good and ill,
And missed the meaning? Have you felt the chill,
Hard force of winter, and the tender rain
Of sunny springtide—seen the dawn and wane
Of star on star that God had sent to fill
The darkness of your sky with light, until
The sun came forth to do his work again?
The very fields, when storm and sun have done
Their will upon them, yield one harvest vast
Of praise unto their Maker! Are there none
But wasted joys and sorrows in your past?
Shall it be said of *you*: 'Lo! this is one
Whom life hath failed to educate at last!'

IN VINTAGE-TIME.

A SOUTH AUSTRALIAN SKETCH.

SOME English folks have a strong prejudice against everything Australian, from tinned mutton to millionaires, and especially against Australian wine. Not without reason at first, perhaps, so far as the wine was concerned, for in starting a new industry there are bound to be mistakes, and the Australian growers had everything to learn; for rules founded on long experience in the Old World do not always hold good at the antipodes, where so many things go by the rule of contrary. Then, too, the outlay being heavy and the return slow of coming, there was a great temptation to sell the wine before it was fully matured; hence some of it was 'fortified,' and sweetened with cane-sugar, and doctored in one way or another with no very good result. This penny-wise, pound-foolish plan gave it a bad name, and spoilt the market for those who produced a better quality. The prejudice thus formed was strengthened by the fact that some wine-merchants, knowing the popular taste, sold the better Australian wines as French, and inferior French as Australian. For a while the wine-industry in South Australia flagged and many growers gave it up; but of late years it has revived: with experience and better appliances, our wine-growers now produce a more even quality, and their wine is rising in the public favour. The export of wine is yearly increasing, new vineyards are being planted, new cellars built, and wine bids fair to take its place with wheat and wool as one of our staples.

One of the features a stranger first notices on arriving in Adelaide as adding materially to the charms of that pretty little town, is the range of hills that rises behind it. You see those hills when first you land a gray semicircle, highest in the middle; you see them from Adelaide more clearly, each rock and tree showing distinctly in the clear air; and when you have left the town and its suburbs behind you, you see the vines

upon their lower slopes, for on the foothills of the Mount Lofty range are some of our oldest and best known vineyards. In spring they show as light green patches; but you can see them more clearly in autumn, when the surrounding herbage is burnt and brown. Now April is the autumn month with us, not that it makes much difference to the native trees, which pay little heed to times and seasons; the bees are busy in the blossoming gums and amongst the withered sun-baked grass; some small green blades are peeping; this, and the fact that the sunlight is a soft golden radiance instead of a blinding white glare, is all we have to remind us that summer is over at last. But in garden and orchard the English trees are flaming with yellow and red; late apples and quinces are ready for picking; the last grapes are hanging dead ripe on the vines, and the vintage begun in March is in full swing.

The vintage—what a hackneyed theme it is in song and story, and what stereotyped ideas its name calls up. Vague mental pictures of 'purple grapes' and 'laughing girls,' of 'foaming must'—whatever that may be—and a 'merry set'—it always is a merry set, somehow—who sing and dance as indefatigably as the Quaker in the song; and a general impression that the vintage is a time of merry-making, its hardest work dancing on the above-mentioned 'foaming must,' which might be rather sticky work, but sounds all right when described by Macaulay. Well, that is not the way they make wine in Australia; and if any one with such illusions should visit a South Australian wine-cellar in March or April, he would be sadly disappointed. Still, though unpoetic, our vintage may be of interest—at least we find it so, even though it has not to us the charm of novelty; for one of us cherishes golden recollections of happy holidays spent amongst the long rows of vines in a dear old vineyard—of unrestricted feasting amid acres of luscious fruit—of many a rousing romp in the old wine-cellar, daring trapeze acts on the ropes used for raising casks from the lower cellar; and awe-struck peeps

into its black depths when the trap-doors were opened—memories that rise up fresh and clear as we walk briskly towards those gold-green foothills, where the yellowing vines show up against the sombre tints of the rocky gum-clad range behind them. We are soon in a shady road, with vineyards on either hand; while before us there flaunts a red ensign, giving notice to all whom it may or may not concern that the vintage is in progress here. This looks so picturesque and gay, that, as we pass the cellar which boasts this unusual decoration, we feel inclined to hum—

On the verdant banks of Loire,
It was the vintage-time, &c.

But we soon realise that with the matter-of-fact Anglo-Saxon even a vintage is a serious not to say a solemn thing.

First we come to a gang of pickers, not laughing girls with baskets on their heads, but men in unpoetic moleskins, decidedly grubby about the knees with kneeling on the red clay; and women in shabby dresses and flapping straw hats, carrying kerosene tins with handles like buckets. Yet, in spite of prosaic surroundings, there is a look of rich profusion about the fruit waiting to be carted away—tins of grapes, boxes of grapes, piles of grapes, great mounds of fragrant muscats all golden and brown with ripeness. Following one of the grape-carts, we go through a gateway and up a road, past more vines, on which small black clusters are hiding amongst leaves touched with a purplish crimson. At last we come to a clump of buildings half-way up the rise; carts are passing across the yard with their loads of grapes; while at one side a big van is being loaded with wine for export, so that we see the first and last of the process at one and the same time. Still following the grapes that we have watched so far upon their way, we find ourselves under a veranda at the end of one of the buildings. There are two shoots to receive the grapes and conduct them to the crushers—one is for black and the other for white grapes. At this our cart takes up its stand; a strong-looking young fellow, with a much-dinted wide-awake and a merry face, steps forward, and proceeds to pitchfork our luscious muscats into the shoot with as little ceremony as if they were so many coals. A grinding, squelching sound follows; and we go on to see what becomes of them, just peeping in passing at the genius of the place, a bright, well-cared-for steam-engine, by which the work of grape-crushing is done more quickly and more effectually than by older and more poetic methods. Coming to a brick archway, we find a notice posted on it which bids folks leave behind them, neither hope nor their umbrellas, but—'books, newspapers, pamphlets, and political and religious discussions.' Perhaps it is feared that the acrimony of argument might sour the wine. Having nothing contraband about us save a sketch-book, and being assured that these rules only apply to employees, we go down one or two steps, and find ourselves in the cellar. It is not a cellar in the strict sense of the word, the floor being only a few feet below the level of the ground, and the roof high and airy, while open windows on every side let in a flood of light and warmth. Experience has proved that wine does not mature so well in a

cold cellar; so they are now discarded, many of the new wine-cellars being two-storey buildings. Passing between rows of tall dark vats, we are soon beside the crushers and in the very thick of the work. Here, wedging ourselves between two large vats, in order to be out of the way, we watch events awhile. The grinding, squelching sound continues, and the crushed grapes fall from a wooden spout into a tub before us, while the stems fly out of a shoot to the left. Men with their sleeves turned up and their canvas aprons stained a dull purple—for they have been crushing black grapes till now—dodge about with buckets; there is a great deal of lading and pumping, and a general look of stickiness—in short, it puts one in mind of jam-making and washing-day rolled into one. And this is a vintage!

Not to be too minute, the process we watch is as follows: The grapes are passed through rollers, mangled, in fact, the stalks being separated from the berries. The tub into which the crushed berries—now termed 'marc'—fall is so constructed that the juice or 'must' may drain into an outer tub in which the first is set. As the tub fills, it is run off and pumped up into a little tub on wheels, which trundles away with it on a tramway over our heads and tips it into its destined vat. The marc meanwhile is ladled into a vat, where its own weight expresses more of the juice; and lastly it is taken away to the press for a final squeeze. The presses are being opened as we pass out, and disclose what look like blocks of purplish plum-pudding—all that is left of the purple grapes crushed this morning.

So much for this part of the business. As we take a hasty backward look at the cellar we are leaving, it gives us an impression of an elaborate study of perspective done in casks. We cross the yard and enter another cellar, where we see more casks, most of them new, and being tested; for the Customs' authorities will not allow a leaky cask to be shipped away, and sometimes the soundest-looking staves prove porous. These casks are of oak, as are many of the vats; but our guide informs us that native red gum is perhaps better for vats, the wood being harder and the grain closer. Leaving this cellar, which is nearly full of this year's wine, we pass into the next, where we are shown a new vat. It is certainly a notable member of the tub family, this great oak structure that towers above us—its capacity, as we may see by a chalk-mark on its side, is ten thousand seven hundred and twenty-five gallons. Our guide looks at it with affectionate pride, and calls it 'she'—says they are going to put up two more like it shortly. 'Is it full?' we ask. 'Yes; full to the brim,' is the answer. So also, it seems, are dozens of other vats, five thousand gallons and under, the smallest of which looks big enough to drown half-a-dozen Dukes of Clarence comfortably. This is not a pleasant thought—suppose one of them were to burst! Of course they won't; still, it is dark here in the shadow of these tall vats, and the air is heavy; so that we are not sorry when we pass out of this cellar into the next, where the bottling is done. Here we watch the processes of corking, sealing, and affixing capsules, facilitated in each case by some handy labour-saving machine. The corking-machine proceeds

with a lofty disregard of the relative sizes of corks and bottle necks, and will, if required, thrust two or even three full-sized corks into the neck of a small pint bottle. It is made to do so for our benefit, and makes one think of fate remorselessly jamming unhappy mortals into unpleasant positions. With this machine, four men can, we are told, bottle fifty dozen an hour.

Our investigations must end here. We have seen all that is going on at present, though not by any means the whole process of wine-making. The colourless, sweetish fluid we saw in the first cellar has to go through a great deal more before it becomes matured wine worthy of these neat seals and labels. It has to be racked, poor thing, as soon as it has done fermenting, 'racking' being the technical term for pumping it out of one cask or vat into another, in order to get rid of the lees or mud at the bottom. New wine is racked repeatedly during its first year, in order to clear it. Next, for some years it has an uneventful life in those big vats we saw; yet even in its dark prison it does not forget the parent vine, with which it seems to have some strange sympathy, for in spring-time, when the sap rises in the vines, the mud begins to rise in the wine, till by the time the buds are bursting it is quite cloudy, however clear it may have been. The mud soon sinks again, leaving it as clear as before. What with racking, cask-cleaning, and bottling, there is plenty to do in the cellars, even when it is not vintage-time, cleaning the vats being especially disagreeable work, for the carbonic acid generated by fermentation kills instantaneously any one unlucky enough to breathe it. A lighted candle should be lowered into each vat before it is entered. If it burns, well and good; if not, it is not safe to follow. But men are careless, and will neglect even this simple precaution to their own hurt, and deaths have occurred, though not in this neighbourhood, we are glad to learn.

But it is time to be turning homewards; the sun is dipping towards the silver strip of sea that shines beyond the plain at our feet as we take leave of our guide at the cellar door, and the last grape-cart we meet, as we hurry down the vine-fringed road, is gilded into picturesqueness by the sunset light.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXVIII.—THE LESSON OF THE STREET (continued).

ELSIE's guide stopped to greet a woman whom he knew. She had the usual baby on her arm. She was a sad-faced woman, with some refinement in her looks: she was wretchedly dressed, thin, pale, and dejected.

'The same story?'

'Yes, sir. It's always the same,' she sighed hopelessly. 'But he would work if he could get anything to do. Nobody will employ a man who's had a misfortune. It's hard—because such a thing may happen to anybody. It's like

measles, my husband says. He can't get drunk because there's no money. That's my only comfort.'

He gave her some money, and she passed on her way.

'Her husband was a clerk,' Mr Gray explained, 'who took to drink and robbed his employer. His father was a barrister, who died young. His grandfather was a well-known—almost a great lawyer. I know the whole family history. I learned it'— He stopped for a moment, as if his memory suddenly failed him—'somehow—a long time ago. It is a story which shows how our sins and follies fall upon our own children. This family sprang from the gutter. First, the working man: then his son, the shopkeeper: then his grandson, who became a great lawyer: then his great-grandson, not so great a lawyer. He, you see, is the first of the family who begins life as a gentleman and is brought up among gentlemen: he inherited money: he had a practice: he married in the class called gentle, and had children. But he lost all his money and in despair he killed himself. Cousinly affection is a cold thing at best. It helped the widow to a pittance, and sent her boys to a cheap school. At fifteen they had to take whatever employment they could get. Observe that this branch of the family was now going down-hill very fast. The future of a boy who has been taught no trade and has entered no profession is black indeed. One of the boys went out to New Zealand, which has little to give a friendless boy: another enlisted, served three years, and has never got any work since. I believe he carries boards about the street. Another became a tenth-rate actor, and now starves on fifteen shillings a week, paid irregularly. Another—the youngest—was put into a merchant's office. He rose to a hundred and twenty pounds a year: he married a girl of the clerical class—that woman you saw: he took to drink: he embezzled his master's money: he went to prison: he is now hopelessly ruined. He cannot get any lower in the social scale. What will his children do? They have no friends. They will grow up like the children around them: they will join the hopeless casuals: they will be hewers of wood. Property, my child, Property—has done this. He stole. In our society nobody will be tempted to steal. He drank—with us he would be kept judiciously under control until he could be trusted again. That would be the care of the State. He is another victim of Property. When his grandfather was framing Acts of Parliament for the protection of Property, he did not dream that he was making another engine for the oppression of his grandchildren.'

Said the other Voice: 'We rise by our virtues. We sink by our vices. Let these people suffer. Their sufferings should make the rest of us wiser. Teach the children to rise again as their great-grandfather rose. Do not contend against the great Law which metes out suffering in return for vice.'

'Those,' continued the Socialist Professor, 'who do most to make a few men rich are the real enemies of what they suppose themselves to be defending. Given a thousand women sweated for one man, and there presently arises indignation either among the women or among the

* Copyright 1892 in the United States of America by Harper & Brothers.

bystanders. From indignation we get revolution, because the employer never gives way. He cannot. He would lose, if he did, his wealth, which is his Heaven. If you divide the thousand women into companies of ten, each company under its own sweater, and all the sweaters under other sweaters, you make a hierarchy of sweaters, culminating in one at the top. That was the old state of things. The man at the top was a Chief, a Patriarch: he knew his people: he sweated them, but kindly: he tossed them crumbs: he looked after the sick and the old. Now all this is changing. The old family tie—such as it was—is dissolved. The man at the top has disappeared: a Board of Directors has taken his place: there is nothing left but the Board and its employees. The men who work are no longer interested in the business of the firm, except so far as their pay is concerned. Their pay will go up, and the dividends will go down. And with every increase of wages so much Property is destroyed. Let everything—everything—be turned into Companies to help the destruction of Property.'

Said the other Voice: 'Property is strengthened by being diffused. Companies organise labour: they give capital its proper power: they are not easily intimidated: they interest all who can save anything. Let us turn into companies every industrial and distributive business in the country.'

'All times of change,' the Master went on 'are times of interest. We are living at a time when great changes are impending—the greatest changes possible. Before great changes there is always a period of unconscious preparation. The minds of people are being trained. Without any perception of the fact, old ideas are dying out and new ones are coming into existence. When the Revolution actually arrives, everybody is ready for it and nobody is surprised. It was so with the Reformation. For a hundred years and more the idea of the Great Revolt had been slowly growing in men's minds. When it came at last, there was no surprise and there were few regrets. For a hundred years and more the ideas of the French Revolution had been talked about by philosophers: these ideas sank down among the people. Nobody was surprised, not even the nobles themselves, when the end came. So with our Revolution. It is coming—it is coming—its ideas are no longer timidly advanced—here and there—by a fanatic here or a philosopher there: they are lying in the hearts of the people ready to spur them into action: they are helping on the cause by successive steps, every one of which means nothing less than the abolition of Property. These things are new to you, child. You were only born yesterday or the day before. I was born a hundred years ago or thereabouts. Consider again'—he leaned against a lamp-post for greater ease, and discoursed as one addressing an audience—'Consider, I say, this great question of companies and their results. Formerly, one man made things which he took to market—sold or exchanged, and went home again. He, by himself, did everything. Then one man made, and another man sold. The next improvement was for twenty men to work, for one to receive and to collect their work, and for another to sell it. In this way the twenty remained poor, and

the two became rich. So they went on, and trade flourished, and the twenty producers more and more fell into the power of the two, who were now very rich and strong. Now the merchants are forming themselves into companies, and the companies are amalgamating with each other, and the small people may contemplate ruin. For these—now merchants, shopkeepers, manufacturers, workmen—there will be nothing but service in the companies; no possibility of acquiring Property, nothing but service all their lives. Now do you see how that helps the cause? They will become accustomed to work, but not for themselves: they will grow accustomed to work for a bare living and no more: they won't like either: but they will ask why the second should go with the first: the two great obstacles to Socialism will be removed. Then, either the step I spoke of just now—the abolition of the dividends—or which is just as likely, a revolution, when the servants of the companies shall make the State take over all and work them for the good of all. Some there are who think that the workman will have hope and power for union crushed out of him. I think not; but if so—woe to the rich! The Jacquerie and the French Revolution will be spoken of as mild ebullitions of popular feeling compared with what will happen then. But I think not. I do not believe that the working man will sink again. He has got up so far. But he needs must climb higher.'

'You think it would be impossible'—by this time a small crowd had got round them, but the speaker still addressed his disciple as if no one else at all was listening—for the State to take over the great producing and distributing companies. But it has been done already. The State has the Post and the Telegraph Services. They will deal with railways, steamers, coaches, cabs, omnibuses, trams, canals, water, gas, electric light, breweries, bakeries, factories, shops, just as they have dealt with these two. The State can take it all. The State will take the management of all. But, you say, the shares of the company will become Funds. They will, and the Funds will pay interest—but the interest will become rapidly lower and lower, so that what was once five per cent. is now but two and a half, and before long shall be two—one and a half—one—and nothing at all. There will be no cry of spoliation, because the holders of stock will be forced gradually into looking more and more to their own efforts, and because widows and sick people and old people, to whom the stocks were once so useful, will be all provided for by the State as a matter of right, and without any of the old humiliation of pauperdom. Pauper? Oh, heavenly word! Child, in the world of the future—the world which you will help to mould, we shall all be paupers—every one.'

He spoke with fine enthusiasm, his face lit up, his eyes bright. The girl was almost carried away, until the other Voice began coldly and judicially:

'Nothing is so good for man as to be ruled and kept in discipline, service, and subjection. It is a foolish and a mischievous dream which supposes all men eager for advance. The mass of mankind asks for no advancement. It loves nothing and desires nothing but the gratification

of the animal. Give it plenty of animalism and it is satisfied. That condition of society which keeps the mass down and provides for the rise of the ambitious few is the only condition which is reasonable and stable. Base your social order on the inertness of the mass. Make the workman do a good day's work: pay him enough, so that he shall have some of the comforts he desires: educate the clever boy and make him foreman, head-man, manager, or artist, journalist, dramatist, novelist. Give him the taste for wealth. Let him have some. Then he, too, will be ready to fight if necessary in the army of order.'

While the other Voice was speaking, there came slouching around the corner into the street where he held the fifth—perhaps the tenth part of a room, a really excellent specimen of the common or London thief, the habitual criminal. He was a young man—the habitual criminal is generally young, because in middle and elderly life he is doing long sentences—he had a furtive look, such as that with which the jackal sallies forth on nocturnal adventures: he had a short slight figure, a stooping and slouching gait, and narrow shoulders. His eyes were bright, but too close together: his mouth was too large and his jaw too heavy: his face was pale, his hair was still short, though growing rapidly: his hands were pendulous: his round hat was too big for his little head: he wore a long loose overcoat. His face, his figure, his look proclaimed aloud what he was.

He stopped at the corner and looked at the little crowd. Everybody, for different reasons, is attracted by a crowd. Professionals sometimes find in crowds golden opportunities. This crowd, however, was already dispersing. The speaker had stopped. Perhaps they had heard other and more fervid orators on the Socialist side. Perhaps they were not in the least interested in the subject. You see, it is very difficult to get the hand-to-mouth class interested in anything except those two organs.

'This street,' said the Master, observing him with professional interest, 'is full—really full—of wealth for the observer. Here is a case now—an instructive though a common case.' The fellow was turning away disappointed, perhaps, at the melting of the crowd and any little hope he might have based upon their pockets. 'My friend?'—he heard himself called, and looked round suspiciously—'you would like, perhaps, to earn a shilling honestly, for once.'

He turned slowly: at the sight of the coin held up before him, his sharp eyes darted right and left to see what chance there might be of a grab and a bolt. Apparently, he decided against this method of earning the shilling. 'What for?' he asked.

'By answering a few questions. Where were you born?'

'I dunno.'

'Where were you brought up? Here?—In this street? Very well. You went to school with the other children: you were taught certain subjects up to a certain standard. What trade were you taught?'

'I wasn't taught no trade.'

'Your father was, I believe, a thief?'—The lad nodded.—'And your mother too?'—He nodded again, and grinned.—'And you yourself and your

brothers and sisters are all in the same line, I suppose?'—He nodded and grinned again.—'Here is your shilling.' The fellow took it, and shuffled away.

'Father—mother—the whole family, live by stealing. Where there is no Property there can be no theft. In our world, such a creature would be impossible. He could not be born: such parents as his could not exist with us: he could not be developed: there would be no surroundings that would make such a development possible. He would be what, I believe, men of science call a Sport: he would be a deformity. We should put him in a hospital and keep him there until he died.'

'In that world,' said the other Voice, 'there would be deformities of even a worse kind than this—the deformities of hypocrisy and shams. By a thousand shifts and lies and dishonesties the work of the world would be shifted on the shoulders of the weak. The strong man has always used his strength to make the weak man work for him, and he always will. The destruction of Property would be followed by the birth of Property on the very self-same day. There is the power of creation—of invention—which is also a kind of Property. Laws cannot destroy that power. Laws cannot make men industrious. Laws cannot make the strong man work for the weak. Laws cannot prevent the clever man from taking advantage of the stupid man. When all the failures—all the deformities—have been killed off, the able man will still prey upon the dull-witted. Better let the poor wretch live out his miserable life, driven from prison to prison, an example for all the world to see.'

It was at this point that Elsie discovered the loss of her purse. Her pocket had been picked by one of the intelligent listeners in the crowd. She cried out on finding what had happened, in the unphilosophic surprise and indignation with which this quite common accident is always received.

'Child,' said the Master, 'when there is no longer any Property, money will vanish: there will be no purses: even the pocket will disappear, because there will no longer be any use for a pocket.—Did the purse contain much? Suppose you had nothing to lose and nothing to gain. Think of the lightness of heart, the sunshine on all faces, which would follow. I fear you are rich, child. I have observed little signs about you which denote riches. Your gloves are neat and good: your dress seems costly. Better far if you had nothing.'

'Master, if I were like that girl on the other side, would you like me better? Could I be more useful to the cause if I dressed like her?'

The girl was of the common type—they really do seem, at first, all alike—who had on an ulster and a hat with a feather and broken boots.

'If I were like her,' Elsie went on, 'I should be ignorant—and obliged to give the whole day to work, so that I should be useless to you—and my manners would be rough and my language coarse. It is because I am not poor that I am what I am. The day for poverty is not come yet, dear Master.'

'In the future, dear child, there shall be no poverty and no riches. To have nothing will be the common lot. To have all will be the common

inheritance. Oh! there will be differences: men shall be as unlike then as now: we shall not all desire the same things. You and such as you will desire Art of every kind. You shall have what you desire. In our world, as in this, like will to like. You shall have the use for yourselves of pictures, of musical instruments, of everything that you want. The rest of the world will not want these things. If they do, more can be made. You shall have dainty food—the rest of the world will always like coarse and common fare. Think not that we shall level up or level down. All will be left to rise or to sink. Only they shall not starve, they shall not thieve, they shall not be sweated. Oh! I know they paint our society as attempts to make all equal. And they think that we expect men no longer to desire the good things in the world. They will desire them—they will hunger after them—but there will be enough for all. The man who is contented with a dinner of herbs may go to a Carthusian convent, which is his place, for we shall have no place for him in a world which recognises all good gifts and assigns to every man his share.

Then spoke the other Voice, but sadly: 'Dreams! Dreams! There are not enough of the good things to go round—good things would become less instead of more. Without the spur there is no work. Without the desire of creating Property, all that is worth anything in life will perish—all but the things that are lowest and the meanest and the commonest. Men will not work unless they must. By necessity alone can the finest work be ordered and executed. As men have been, so will men always be. The thing that hath been, that shall be again.'

'You have learned some of the lessons of Poverty Lane, Scholar,' said the Master.—'Let us now go home.'

HOW WE SAW THE BAHAMA CABLE.

BRIGHT and warm as usual, although the middle of January, was the day in those sun-loved isles, the Bahamas. Blue, as usual, was the sky above; blue, also, the waters around. A slight breeze was blowing, which, on sea, raised here and there little curling breakers; and on land stirred gently the drooping, graceful heads of the palms and cocoa-nut trees. Heedless and unconcerned were the elements as to why that strange large steamer was lying off the bar of Nassau harbour. Not so, however, were the inhabitants of the little colonial town which has the honour of being the capital of the Bahamas. Great and deep interest did they take in that boat. For did she not bear their long-looked-for and long-hoped-for Cable, that mysterious and wonderful link of connection which was at last to join them to the outside world? The *pros* and *cons* of obtaining one had been discussed and weighed for several years; but now all difficulties had been overcome—the cable was to be established. Its advent had been eagerly looked for; great hopes had been formed of the blessings it would bring to the colony: how it would improve trade and open up business connections; what a number of fresh American visitors it would probably allure for the winter months, visitors, who, though keenly enjoying the delightful, health-giving

climate during those months, do not care to be cut off from all possible outside communication except by the fortnightly mail; and, in fact, how in every way it would increase the prosperity of the place. From the moment the smoke of the steamer had appeared above the horizon, and the signal flag on the fort had proclaimed what she was, many had hurried to their seaward-looking verandas and watched her plough her way surely and steadily to Nassau. She was to stay three or four days, get her shore-end laid here, and then depart for Jupiter—not the planet, for she had neither wings nor aerial apparatus, and the islanders did not yet aspire to hold telegraphic communication with unknown beings in the stars, but were contented at present merely to be more closely connected with this prosaic earth and ordinary fellow-creatures. The Jupiter our cable boat—by name the *Westmeath*—was bound for was a little town on the coast of Florida where a permit had been granted to lay the cable.

We must go across the harbour, beyond the bar, and board the ship to see the wonderful cable. A party is arranged; the boat to take us is lying at the wharf; the different individuals stroll up by twos and threes till the number is complete, the early ones rather fuming and impatient, thereby making themselves all the hotter, for, though but the middle of January, it is indeed scorchingly hot upon the low-lying unsheltered wharf. The sun beats down on our devoted heads, and no breath of breeze comes to fan us from the calm waters of the harbour, shut in as it is and naturally formed by a long-stretching island, named, for no apparent reason, 'Hog Island.' At last we are all on board our little sailing-boat, longing to get out on the open sea. The boat we have to-day, though off duty for the present, is ordinarily a sponger; and very dangerous her decks must be to the poor spongers if sea or weather is at all rough. She has no bulwarks; the roof and walls of the cabin rising about three feet from the deck fill the centre of the boat; and round this run her narrow and utterly unprotected decks. However, it is calm enough this morning; so we seat ourselves comfortably on the aforesaid roof in the generous shade of her mainsail. There are about ten of us, one American, all the rest English. Clerics predominate. Ah! it is nice to be comfortably lolling in the shade like this, after the hurry down to the wharf. But alas! the boom against which so many are confidently reclining begins ominously to move, and threatens to clean sweep all off the cabin roof into the water, which lies so still and transparently clear below. Not desiring a ducking just now, inviting though the water appears, we get up hurriedly. Orders are given for all to go below till the sails are fixed up and the boat fairly started. Into that stuffy cabin this hot day! I linger behind, politely allowing others to pass down first; and find, when all but one or two equally lothful ones are in, that there is no room for me, so stay on deck and watch operations.

Soon the boat begins to move, carried by the tide, I suppose, for there seems scarcely a breath of wind; but 'we shall be getting a nice breeze when we are off a bit,' says the dusky sailor, and I trust him. We certainly do somehow get clear of that melting wharf and slowly

begin to cross the harbour. Oh the exquisite blueness of that sea—what a glorious colour it is! I look down through the lucid depths, clearly seeing the bottom, and watch the innumerable and many-coloured little fish dart among the flowing sea-weeds and coral-formed rocks. How clear and cool it looks down there; how nice to be a nymph or some other amphibious creature on a hot day! Suddenly, 'A shark!' calls out the sailor. In an instant I am by his side; and there, not ten yards from us, see for the first time that dreaded terror of fish and man lazily and unconcernedly paddling past our boat. 'He is near upon eighteen feet long,' says the sailor. I shudder, and feel glad, after all, I am not a nymph, &c.; for I have no desire to become part of a shark. It is more comfortable to be safe above his reach, even though seated on a blistering deck, where you can feel a superior contempt for him, which perhaps would not come so readily at closer quarters.

But now the promised breeze is filling our sails, and all are again on deck. The discomforts of heat are forgotten as we feel the delicious breath of the dear old Atlantic on our faces, as it meets us straight from the ocean beyond the bar. We soon clear the half-mile of harbour, safely cross the bar, not without a good deal of lurching on the part of our ship; for on the calmest days a swell is there; and after a few more detours reach the *Westmeath*, our goal. How massive and inaccessible her ironclad sides appear, towering so far above our humble little decks. Nothing but a break-neck-looking spiral staircase can be seen whereby to enter. But the Westmeathians soon hail us, and orders are apparently given to lower a gangway, for a safe and inviting stairway is swung down before our eyes, making an easy and comfortable ascent for ladies as well as gentlemen. How delightful it is to be on board a really big steamer once more. Although looked down on by ocean liners as 'only a tramp,' the officers inform us she is by no means small; and to us, who have been forced to brave the sea in little sailing-boats or a small interinsular steamer, she seems deliciously spacious and so strong and powerful. At first we run about her, exploring with almost childish glee, thinking for a time, I imagine, more about the boat itself than her precious freight we had come to see. Her decks seem so broad and long, and how high up we feel above the water! We lean over the bulwarks of her seaward side, looking down at the water, which seems so far below, and imagine that we have all just come on board bound for England and home. For does not the dear old country lie away out there, across that blue expanse, and is it not natural that 'our lingering hearts will turn, beloved home, to thee,' and that memories of happy moments gone again crowd freshly on us! I, who have been out but a few months, feel this; while some of these have not seen their native land for years. Our eyes wander dreamily over the restless waters and little curling white breakers to the far-distant horizon. When shall we really cross it again? What are those we love, on far-distant shores, doing now? What changes is Time working?

But we have come on board to see the cable and not to dream. The officers and electricians are most genial and kind. They have welcomed

us from the first moment with true British frankness, evidently as really glad to see us as we are to exchange greetings with fellow-countrymen from over the water; for it is delightful to meet and talk to fresh Englishmen again. They have come direct from London, have not even stopped at New York, as ordinary travellers to these indirect islands have to. They can give us the very latest news, that of a fortnight old being new to us, having at that time no telegraphic communication. They were in London on Christmas eve, the boat compelled to remain in the docks all Christmas day, a most fearful and pitiless fog harassing all movement. 'With the greatest difficulty we found our boat,' some of them murmur; 'the fog hung over the city like a death-pall.'

We shudder, and congratulate ourselves on our sunny skies and genial warmth. The whole week before they had had glorious skating. Pangs of deep envy dart through us as we think of our never-ending summer. We stand thus, high up on the bridge, some time talking, the delicious fresh breeze fanning and invigorating us, and the blue sea, blue sky, and bright sun beautifying everything. But in spite of the fascinating interest which this sort of conversation has, we leave it for a while, and descend on deck now at last, really to view the cable. We are guided through a rather dirty passage, on one side of which are penned some fine broad-shouldered sheep, which look happy and comfortable and as if sea-life agreed with them. These animals must have been a source of wonder to any native Bahamians who have not seen an English sheep, the native sheep being miserable objects of skin and bone, almost woolless, and when converted into mutton giving herculean labours to the teeth and jaws.

Soon we come to the open decks again, and there yawn the immense tanks which hold the two hundred and fifty miles of cable. We peep down. At first, in those dark depths which reach to the hold, we dimly see water surging up and down. It startles you at first, making you have the uncomfortable feeling that the ship has sprung a gigantic leak. But soon the eyes get accustomed to the light, and easily distinguish the mighty cable lying coiled up, still and lifeless, with foamy, dirty-looking water surging to and fro over it with the swing of the boat; for the cable must be kept in water. Lifeless indeed it lies, and yet we look down upon the wondrous work with almost feelings of awe; for is it not to be filled with that mysterious electrical life which will enable it in a moment of time to carry a message thousands of miles! What we are utterly unable to do, this now lifeless coil is to accomplish for us. I almost feel that it may rise from its watery couch and sweep us puny mortals from the deck.

But I want to see and examine it closer: one has not a chance of viewing a submarine cable every day, and I had not seen one before. So one of the electricians takes me down to the electrical room. Very bright, burnished, and mysterious-looking are the brass fittings, stops, and the rest of the electrical paraphernalia. Rows and rows of jars filled with chemicals line the walls, giving the place the appearance of a storeroom for jams. Pieces of cable in different stages of completion are lying about. Here is

the medium which carries the electrical fluid, a twisted rope of seven copper wires encased in a coating of gutta-percha. Here it is in its second stage, the gutta-percha core again encased in flax surrounded by steel wire. And here it is completed with a protective covering of tarred hemp. How carefully thus is the copper wire protected and insulated!

There is more to be seen yet of the wonderful inventions of man. So we go up again, examine the paying-out machinery at her bows, which has now been brought to such necessary perfection; for cables have often been injured by imperfect appliances for paying-out. Close by is the latest invention for taking soundings. I do not of course understand exactly the hieroglyphics on its dial or the lightning movements of the needle; but the engineers say it is a wonderful and beautiful piece of machinery, saving infinite trouble. It certainly looks ingenious; and if it saves trouble, must of course be all right.

Having seen all there is to be seen of the cable, we still linger a little while. The Englishmen have secured treasures and trophies of these western shores to take back with them, and are anxious to know if we think they have made good bargains. We see two large turtles which would have delighted the heart of a City alderman, lying in one corner of the deck, aimlessly wagging their heads and feebly moving their flabby fins. The happy owner is going to try to take them back to England alive. He will very probably succeed; for they keep alive for weeks if a little sea-water is dashed on their heads now and again. The proud possessor of a pink pearl shows us his treasure, yielded, he tells us, after beating down an enormous price, 'for an old coat.' The Bahamas have sometimes been called 'the land of the pink pearl.' They are obtained from the conch-shells found on these shores, and are frequently of great value and exceeding beauty. This one is very small, but quite worth the price given, I should think. Another sunburnt young Englishman has invested in sponges, which are plentiful enough in these parts. You can often buy enough for a few shillings to last a lifetime. He shows an immense one which would almost fill an ordinary bath, and when saturated with water, would require a Goliath to wield. From the stern of the boat is dangling an immense chain, baited with an enormous piece of meat, to tempt sharks. But they have up till now proved shy of the boat, probably because as soon as one was caught sight of anywhere near, he was instantly popped at with pistols; and not appreciating such a welcome to his meal, usually decamped swiftly. They did, however, manage to land one great fellow before the boat finally departed.

But now we really have to go; and much indeed have we enjoyed the visit, for the Westmeathians have been very good and hospitable to us. We, perhaps reluctantly, descend the gangway; our imaginary journey is over, and yet we are back in the same place! We again place ourselves about our insignificant little boat. Again we look up the towering sides of the big ship, seeing the pleasant sunburnt faces of the Englishmen looking down on us from her bulwarks; the breeze begins to rustle our sails; we are soon a little way from the boat; the separate

figures grow a little indistinct. But they are shouting out something to us. What is it? 'Oh, a camera on board. They want to photograph us.' Almost unconsciously, hair is smoothed, hats set straight. The cap is off; we are taken. We learnt afterwards that in the hurry and excitement they had forgotten to put a plate in, so the galaxy of beauty will not be handed down to posterity. We are receding farther and farther from the *Westmeath*. We hear the reports caused by futile attempts to 'pot' sharks getting fainter and fainter. Soon we are again tossing over the bar. Our visit to the cable is ended.

We shall never see it again. For when the *Westmeath* returns from Jupiter, for a few days, to join up and connect our shore-end, the cable we have just viewed will be paid out and uncoiled, stretching its immense length right across from the coast of Florida; resting quietly hundreds of fathoms down in the wonderful world of the deep blue sea, quietly and unobserved doing its duty. What thousands of messages will soon flash through its serious body! What secrets now will be entrusted to it! But secrets are safe with the silent cable. It will not betray them, not even to the fishes which will play about it, at first, perhaps, with a curious wonder; not even to the shellfish and other parasites which will cling and cleave to it. No difference will it make to the mighty cable whether it is to convey a message to our own most gracious Sovereign or the humblest peasant in the land; to the richest Croesus or the poorest beggar. It will carry all equally well—the greatest State secret, the simple message of love; tragic messages, flippant messages; messages of danger, death, or awful catastrophe; messages of joyful home-comings; prosaic business messages from one merchant to another; messages for evil, messages for good. It will carry them all unquestioningly, uncomplainingly, doing its duty. Will it improve, ennoble, enrich our little colony? Will it fulfil the hopes that have been formed? Time will show.

THE BELLS OF LINLAVEN.

CHAPTER IV.—ALARUM.

A FEW days before this, the Vicar's son, Captain Norham, arrived at Linlaven. He had been on sick-leave for some months. The wound which he had received at Tel-el-Kebir was quite healed, but his general health had been injuriously affected by the severities of the campaign. Clara had joined him when in February he landed at Southampton; and as he was too ill to proceed northwards at once, they had together passed the early spring months in the Isle of Wight. Nor would he have been at Linlaven now, but for the circumstance that he had been hurriedly summoned home. This was in consequence of a letter from Mr Brookes, who has been already spoken of as the family lawyer to the late Squire Norham of Brathrig Hall, and who still acted in that capacity for the Squire's widow. Mr Brookes' letter had intimated to Captain Norham and his wife that the old lady at the Hall, having heard of the gallantry which had distinguished the Captain's conduct in the Eastern campaign, had evidently relented

somewhat of her former severity and bitterness against the daughter of her lost son Arthur, and was apparently disposed to alter the will by which she had conveyed her wealth away from her natural heir and given it to an alien. But before doing anything, she wished to have an interview with her grandchild Clara and her husband; hence Mr Brookes desired that they should come north at once.

Alas for the hazards of a repentance that awakens not the conscience till the eleventh hour! The day before the arrival of the Captain and his wife, the old lady had a stroke of paralysis, from which her physicians had pronounced it impossible that she should recover. And so passed all hope of her being able to rectify the injustice she had already done.

The aged Vicar's joy at once more receiving his gallant boy under his roof was consequently not unmingled with sadness. Nor was George himself much more cheerful. It is true that the sight once more of the little girl and boy who called him father, filled his heart with pleasure and gratitude; but in the background sat black Care distilling pain. Shattered in health, and poor in estate, he could not help reflecting with ominous feelings upon what the future might have in store for his wife and children.

The conversation which we have above recorded between Uncle Giles and Mrs Dale as to the evident premeditated departure of the former took place on a Friday evening. On the following day Captain Norham, in the course of an afternoon stroll, and wearied somewhat and fatigued with the heat and glare of the summer sun, walked across the graveyard and entered the church, the doors of which stood open. It was to him a more than usually sacred place, for here was the pew in which he had sat from infancy to manhood, side by side with the mother who had long since passed into the higher sanctuary behind the veil, and side by side also with her who had been the true love of his youth and was now the mother of his children.

Inside the church, all was calm and peaceful. The sun shone bright and hot on the old stained-glass windows, but soft and cool were the purple shadows within the ancient aisles. He sat down in the vicarage pew, and gave himself up to pleasant reveries of the past. He heard the hum of bees about the windows, and saw the green branches swaying beyond the open door. Whether, lulled into restfulness by the calm and stillness of the holy place, he fell asleep, or not, he could not tell, but once more he heard the bells toll out in the church-tower, and he experienced once again all he had seen and heard in that far-away dream of his sick couch at Cairo. He saw the same shadowy figure walk down the aisle, saw the man halt before the tomb of the Norhams, heard again the accents of grief and dejection with which he uttered the words: '*He—gone; and I—unforgiven.*' Thereupon followed a sudden noise, which woke him to consciousness.

The noise was caused by the slamming of one of the church doors, as if thrown-to by a draught; but this time it was not all a dream. There was some one in the church. The tall figure of an aged man, white-haired and slightly stooping, was approaching softly down the aisle. The Captain

withdrew himself noiselessly within the shelter of a curtain at the end of the pew, whence he could see without being seen. The man walked slowly forward, looking from side to side like one who had simply come thither from a feeling of curiosity, and with no special purpose. By-and-by he reached the tomb of the Norhams, with its white marble effigies and golden emblazements. Something here seemed to attract the man's attention. It was the arms of the family cut upon a shield surmounting the tombstone. He looked at it for a few seconds in a kind of wonder, as if it recalled something to his memory. Then, putting his hand into his breast, he drew out a small leather case, from which he extracted a paper, and seemed for a moment to be comparing something on the paper with what he saw cut upon the shield.

The effect upon the man was strange—almost startling. He grew suddenly pale, as if some unexpected revelation had burst upon him; and with the cry of 'My God! what be this?' turned, and fled from the church.

Captain Norham sat for a few minutes in amazement. What did this mean? What could this repetition of his dream, followed by the appearance and attitude of this stranger, portend?

Quitting the church, he was in a few seconds at the vicarage.

'Clara,' he said to his wife, 'I thought I knew everybody in the village. But to-day I have seen a tall old man, with white hair, whom I feel sure I never saw before.'

'Why, George,' replied Clara, 'that is our little Lucy's friend, whom you have heard her speak so much about. That must have been Uncle Giles. Where did you see him?'

'In the church.'

'In the church?' she said, with a questioning and half-amused air. 'Why, your father has vainly besought him to go to church, but could never succeed with him. The man is evidently decent, and is well behaved; but he has some mysterious scruple as to going to church. He is altogether a good bit of a mystery to everybody.' And she went on to tell her husband the story of his coming among them.

George listened attentively, and then proceeded to tell of the repetition that day of the Cairo dream, and what he had afterwards seen and heard in the church.

Clara, who had at first treated the matter somewhat lightly, was now in turn much impressed by what she heard.

'Why, do you know,' she said, 'the first time I saw the man—it was when he was in a state of delirium—he took me by the hand and called me Esther. I never mentioned it before to any one.'

'Well, and what of that?' queried her husband.

'What of that?' repeated Clara. 'Esther was my mother's name.'

'Oh!' exclaimed George, in a tone between wonder and curiosity. Then, after a pause, he added: 'And does no one know who the man is?'

'Nobody, more than I have told you.'

'Then, Clara, you and I must find out. Put on your bonnet; we must seek him at once.'

They walked down the garden-path together in the direction of Lawrence Dale's house. The cottage which Giles inhabited was adjoining the garden wall, and was approached by a greenhouse, through the door of which you could see the entrance. This being Saturday afternoon, and work suspended, Lawrence Dale and a few other villagers were seated on the bench outside the door. Among these was Giles, who, on his way from the church, had been intercepted by two or three lads with a request that he would arrange some fishing-tackle for them. He was now busied with this, and at the same time listening to what Lawrence was reading aloud from a newspaper. Both the miller and his wife came originally from Yorkshire, and the paper was apparently one sent to them by old friends.

Clara drew her husband back a little. Mrs Dale was evidently one of the listeners too, for they could hear her voice inside the cottage door, as from time to time some news of particular importance would call for an exchange of opinion between her and her husband.

'Ah, Milly,' cried Lawrence, 'hark thee to this. Sarah Dobson ha' married Jem Metcalfe after all. It's here in black and white. Did thou ever hear the like?'

'Oh, indeed,' replied Milly; 'that *be* news. Why, how she did flout that young man o' hers, to be sure! "Happen," she would say, "lads shall be so scarce thou will ha' to seek them wiv a candle, ere I marry Jem Metcalfe." Yet she ha' took him at the last. Well, well!'

Lawrence scarcely heeded Milly's concluding comments, for something of apparently more engrossing interest had attracted his attention in the paper, and he read a few lines to himself as if by way of tasting its flavour before offering it to the others. 'It's put in big type, anyway,' he said at length; 'it must be something worth reading.' And without further exordium he proceeded.

'STRANGE DISCOVERY.—At the *White Horse Inn*, about three miles from this town, a somewhat singular discovery was made a few days ago. Some changes were being effected in the interior arrangements of that long-established and popular hostel, when, in the course of the operations, the workmen had occasion to lift the flooring of the Blue Room. While doing so, one of them found under the floor, close to the wall on the west side, a gold watch, which appeared, from the dust that had gathered round it, to have lain there for a long time. A piece of thin silver chain was attached to it; and on the outer case of the watch was an engraved monogram. Inside the case was a paper bearing that the watch had been cleaned and repaired by the firm of Lessing & Jobson, of this town, more than a quarter of a century ago. Upon inquiry being made of this firm, they found from their books that the watch had belonged to a gentleman of the name of Arthur Naseby, which agreed with the monogram "A. N." on the back of the watch. This discovery has excited much interest in the town, as our older readers will remember the somewhat extraordinary disappearance from our midst of the gentleman above named. A great deal of mystery surrounded the whole affair;

but it was believed by many, after his disappearance, that the name by which the owner of the watch was known here was not his real name. We refrain at present from entering into details that might be painful to some of his friends who may still be alive among us; but we may mention that there was some reason, from what transpired after his disappearance, for thinking that his real name was Norham, and that he was connected with an ancient and aristocratic family in the north of England. What gave additional mystery to the disappearance of this young gentleman, was, that he had only been about a year married, and was much respected and beloved within the circle of his acquaintance.'

When Clara and her husband had first come within sight of the group, and heard Lawrence, in his loud, slow, drawling Yorkshire voice, ponderously retailing the news of the day, it was more from a feeling of amusement than any other motive that Clara waited and listened. But as he continued to read, a deeper interest was awakened in her. From where she stood, she could see Uncle Giles seated on the bench, and was astonished at the extraordinary expression which his countenance assumed at the mention of the finding of the watch. The blood entirely deserted his face, and he let the tackle on which he was working fall from his hands as if he had been struck with paralysis. Captain Norham saw this also, and watched his wife's demeanour with something of alarm. As Lawrence read on, her eyes gradually developed a look of strained attention, as though every word he uttered went deep down into her very soul. A strange pallor overspread her face; she reached out her hands and clasped with a feverish grip at the back of a garden chair that stood near by, as if her limbs were no longer able to support her; then, as the reader concluded, she uttered a stifled shriek, and fainted away.

Her husband caught her in his arms as she was about to fall. Her cry brought Lawrence Dale and the others to her help, and she was carried back to the vicarage.

In the confusion that followed upon Clara's cry of distress, the movements of the old man Giles were unobserved. When the reading of the newspaper was ended by that sudden cry, the little group before the cottage was suddenly scattered; whereupon he immediately rose and entered his house. He was ghastly pale, and trembled like a man in an ague fever. A sharp fire burned in his eyes, and he clutched at the wall for support as he went.

'It ha' coomed at last,' he muttered. 'Be thou ever so fleet o' foot, the vengeance o' God is fleet.'

He did not sit down, or tarry for a moment; but going to where he had thrown his packed valise the evening before, he lifted it up, and taking a staff from the wall, quitted the house.

He walked off, at first slowly, but, as he regained composure, at an increasing pace, going directly towards the Old Grange. He was about to enter the familiar door, when he hesitated, and looked as if he would turn away without entering. There were voices within, and this startled him in a strange way. Yet what was there to fear? The men inside were only workmen, every one of

whom he knew, busily engaged in completing some repairs upon the old place. He might easily pass up the tall stairs to his own quarters without being seen. Yet still he hesitated. At length he said: 'It must be done, whether they see me or not. I cannot make my way with never a penny in my purse.'

He ascended the long stairs with slow and cautious foot. When he had reached the top floor, he unlocked a drawer near his bench, and took therefrom a little box which contained a few silver coins. Putting them in his pocket, he was about to leave the room, when he observed, just where the evening sun streamed warmly in through the dusky pane, the little maid Lucy lying asleep beside her playthings.

'Ah, thou here!' he said in a low voice, that had a perceptible quiver in it. He approached, and bent down over the sleeping child. 'I see it all, my little Lucy. Thou ha' been seeking Uncle Giles, and a-waiting for him till thou ha' fallen asleep.' And as he touched her fair tresses, his first impulse was to raise her up and carry her home—as at other times he would have done. But he dared not do this now. It might frustrate in some way his departure, and he *must* go. She was safe enough; her nurse was sure to seek and find her here.

Lifting a pair of scissors from the miscellaneous gathering of tools upon the bench, he raised one of the shining locks of the sleeping child, and cut off part of it; then taking from his breast that same little leather case we have before seen, he placed the tress inside, and turned to go. But once more he came back and looked at the child, with something pensive and touching in his eyes. 'God bless thee,' he said, 'and keep thee! May thou sometimes think on old Uncle Giles when he be far away.' Then he began to descend the stairs—slowly, with groping hands, and a great mist in his eyes.

He had soon left the valley behind, and was ascending the hill-road by which, only a few months before, he had first entered Linlaven. At the outset he walked quickly, as if dreading observation or interruption; but as he entered the solitude of the broad Fell, he went upward with slow and yet slower steps, turning from time to time to gaze on the village below. The place never looked to him more beautiful than now, under the splendid effulgence of the summer sunset, with the level light gleaming along the mere, and wrapping the high church-tower in a golden glory. All the hills around were bathed in the yellow light; and far beyond he could see the mountains of Westmoreland rising up dark against the kindling west, their broken and serrated ridges gleaming like massive jewels through the soft purple haze.

It could be seen that various and strong emotions had taken possession of the man's soul. 'For nigh thirty years I ha' fled from my fate, yet it dogs my footsteps as I ha' seen a bloodhound nose the track of a slave.' Yet still he passed upwards, heedless more and more of his surroundings. The wild thyme and the bright-eyed tormentil were at his feet, and around him was the sweet scent of the pines; but they had no charm, because they had no existence, for him. Once over the brow of the Fell, with village and lake and church-tower all hidden from his sight,

he sat down on the heath, and gave vent to his misery in tears. Here, among these scenes, he had for a time been tranquil—almost happy; and now, driven forth by the exigencies of his own blighted existence, he must leave them, and for ever. For thirty years, as he numbered it, had he fled before the slow foot of retribution; and yet, here, among those wilds, was not Nemesis coming up with him at last?

Sitting there—the moor-birds circling with wild screams round his head, and then darting away with a warning cry—he took no note of time. Suddenly he was aroused out of his reverie by a quick sound that struck upon his ears. It was the bells of Linlaven!

Why should these bells be ringing now? Was it the curfew? No; for they were ringing out in tones harsh and angry. Never, surely, during the three centuries since our Lady of Langleydale brought over these bells from Holland, and hung them in the gray church-tower of Linlaven—never had they given forth such clamorous and discordant music. The man started to his feet, and stood for a brief moment listening to that wild alarum, re-echoing and reverberating among the hills.

'It must be fire,' he said, as he turned and ran towards the ridge he had just crossed, and from which Linlaven could be seen. The bells sounded out with a still more angry and dissonant clangour as he came within sight of the valley. The sun had already left it; but the twilight was yet clear along the lake, and he could see a dark cloud of smoke floating ominously in the calm air.

'It *is* fire!' he exclaimed. 'And,' in a horrified whisper, as he looked again, 'it is the Old Grange! And Lucy—my little Lucy—what if they ha' not found her? Oh God,' he cried, in a voice of agony—'must yet another sin be laid to my charge?' And as he uttered these words he rushed madly down the hill towards the village, dashing onwards with all the recklessness and energy of despair.

ON MAN-EATING REPTILES.

By DR ARTHUR STRADLING, C.M.Z.S., &c.

THE popular concept of a reptile embodies the very presentment and incarnation of that which is hurtful, repulsive, and, above all, aggressive. Serpents are endowed with venom to enable them to wreak destruction on the human and every other race with which they are brought into contact, or—under the most charitable ascription—are provided with the same 'as a means of self-defence.' Crocodiles and alligators are always on the chase for man, if they do not prey exclusively upon him; and the minor members of the scaly tribe are regarded with a vague sense of disfavour, grounded, no doubt, on that involuntary antipathy which lies outside the province of reason or the will, but capable, nevertheless, of entertaining any evidence as to their misdeeds with a preconceived readiness to believe it.

Still, the vast majority of reptiles may safely be pronounced to be innocuous to human beings, poisonous snakes of course constituting one, and

much the greatest, exception. It would be foreign to the purpose of this paper to recapitulate the terrible records of death from the bite of these creatures in India; and in our consideration of reptiles likely to regard us from a dietetic point of view, we may dismiss in their entirety two of the four great orders of reptiles, the lizards and the chelonians. Of the former, there are no bigger existing representatives than the monitors of Africa, India, Malaysia, and Australia, attaining a length of seven feet, fierce in their resentment of interference, and capable of inflicting a nasty wound with their iron teeth, but credited with no more sensational feat than that of occasionally devouring young crocodiles on the Nile; while most certainly the beak of no tortoise or turtle now living on this earth could do more than exhaust its powers for evil in an awkward pinch.

In connection with the question of man-eating, habitual or casual, we have therefore left to us among reptiles of the present day only the crocodilians and pythonoid snakes; and with regard to the former, unhappily their capability admits of no dispute. From every part of the world where these creatures are found, we gather accounts, only too well authenticated, of human beings carried off and devoured by them. It is said that crocodiles kill more people annually in Africa than all the rest of the wild animals of that continent together; but then, the destruction of life by beasts of prey is not very great in Africa compared with what obtains in many other countries. Indeed, it is just possible that the homicidal propensities of alligators and crocodiles, while by no means a fiction, may have been slightly over-rated. At anyrate, I have spent a considerable part of my life in various reptile-ridden countries where the rivers, tanks, and lagoons teemed with these brutes, so potent for good and ill, and have made it my business to hunt up and inquire into cases of the sort; but I have everywhere found those in which definite evidence was forthcoming very few and far between, though in many instances persons had disappeared in such a manner as to suggest a fair inference that they had come by their death in this way. On the other hand, I have seen numerous severe injuries, obviously inflicted by huge crocodilians, limbs crushed and mangled so as even to require amputation, as well as many slighter lacerations, where yet the sufferer, in spite of being so terribly mauled, has been allowed to escape by his assailant. Such cases used to be not at all uncommon amongst the coolies on the cane-pieces in Guiana, where the whole country is intersected by 'canals,' trenches of muddy water which effectually concealed the ragged jaws lurking beneath the surface; and this is the more curious, seeing that animals once seized rarely if ever escape, even powerful cattle.

Much more difficult to answer is the query, Do snakes eat men? It is hardly necessary to say that the greater *Boidæ*, the anaconda of tropical America, the reticulated python and rock-snake of the East Indies, and the African

pythons, some half-dozen species in all, can alone be taken into account in discussing this matter, as no others are of sufficient size to admit of their swallowing a human being. No serpent masticates or in any way subdivides its prey; whatever it takes in the shape of food it must bolt whole and entire; and this peculiarity excludes from our present consideration all the venomous snakes—none of which grow to more formidable dimensions than a length of twelve or fourteen feet at most, with the girth of a man's wrist—as well as the rank and file of the colubrine snakes and smaller constrictors. The boas, which seem to be regarded popularly as synonymous with all that is biggest in the serpent world, are comparatively small reptiles, of exceedingly beautiful coloration, confined to South and Central America, where a specimen of ten feet would be considered worthy of remark.

I believe we have no evidence whatever to justify us in assuming that these snakes are man-eaters, and that there is not a single authenticated instance of the sort on record. One cannot, of course, deny that the constrictors which I have specified as the giants of their race may, and frequently do, attain such a size as would render them quite capable of the deglutition of an adult human being. The anaconda falls not far short of forty feet in the hot swamps of Brazil and the Isthmus; the West African python has been measured dead at thirty-three; while there is a reticulated python in the London Zoological Gardens the length of which is estimated at twenty-six feet. No live snake can be measured with accuracy, because, big or small, it is never seen in a straight line; curiously enough, and probably for the same reason, it always appears very much shorter than it really proves to be when the tape is applied to its dead body, or to its shed slough if cast unbroken. That such monsters as these *could* swallow men admits of no doubt whatever, any more than that they do occasionally in their wild state feed on deer and other large game. Within a few inches of my pen as I write is a royal python, the smallest species, about five feet long. Two hours ago it ate a dead chicken, half-grown, yet its neck is scarcely thicker than the penultimate joint of my thumb, and has to accommodate spine, muscles, nerves, blood-vessels, windpipe, and many other structures besides the gullet. But I am persuaded that the most gigantic of serpents does not, in its native haunts, habitually take the large prey with which it is credited, and I know that in captivity they thrive infinitely better and live longer if fed on relatively small objects. The anaconda or rock-snake, whose size would permit the constriction and deglutition of an antelope, would probably be found to feed by choice on animals corresponding to rabbits and ducks, though he might affect heavier morsels if hard pressed; small fur and feather, however, would always be the more plentiful and more readily obtained.

There are two stock anecdotes, and only two, which are invariably quoted by writers who contend for the anthropophagous habit, and one of those anecdotes is nearly a hundred years old. One is that related by M. Girondière, in his *Twenty Years in the Philippines*, concerning a murderer,

who had been apprehended by the authorities, but who had succeeded in eluding their vigilance, and, escaping, had hidden himself in a cavern, where his father supplied him with the necessities of life. On going to the cave one day with rice, he discovered a huge boa (python?) asleep, while the fugitive from justice was nowhere to be seen. He killed the serpent, and found the body of his son within it. The other is an account given in the *Bombay Courier* of August 31, 1799, to the effect that a Malay proa, making for the port of Amboyna, missed her daylight off Celebes, and anchored there for the night. One of her sailors went on shore to collect betel-nuts in the forest, and, as was afterwards surmised, lay down to sleep on the sea-shore. Cries for help were heard by the crew during the night and they at once put off to the island, where they found the Malay crushed to death by an immense snake, which was preparing to swallow him. But the shouting for assistance is a fatal bar to our accepting the story; no more inconceivably sudden death can befall man or beast than would result from the onslaught of a giant constrictor.

I was present at the post-mortem examination of the body of the unfortunate man Karoli, who was squeezed to death by a python eighteen or twenty feet long in Madrid some years ago. He was performing with the creature wound about him when he chanced to vex it in some way; the brute tightened on him, and with a gasp he fell on the stage. The audience applauded, thinking it was part of the play, but the *dompieur* was dead. And we found no fewer than eighty-seven fractures of the bones; while lungs, liver, and intestines were split across, all in that one swift, silent, terrible embrace. Squeezed, did I say? *Smashed* would more fitly convey an idea of what these great reptiles can effect by their sinews of supple steel; there could be no crying out for aid, nor could aid be of any avail in such a case. Two of my own ribs were broken by a Natal python, the 'bight' of whose body gripped my side to an extent scarcely more than I can span with my hand. It is remarkable, however, that although many of these snakes are very savage in captivity, and will inflict even serious lacerations by biting, they seem never to put forth their constrictive force as a means of defence or for any other purpose than that of feeding, unless they are held or restrained in some way. A fierce serpent will dash at a fancied aggressor open-mouthed over and over again—I have had my clothes ripped off me by an anaconda which had got loose in a small room—yet they never seem to remember the power of their lateral muscles until they feel themselves grasped.

A most circumstantial narrative of a man-eating serpent in Trinidad appeared in the *Port-of-Spain Gazette* on March 30, 1889, and was extensively copied by newspapers throughout the world, an account so free from the gross exaggeration which characterises most of these stories as to render it apparently worthy of credence. It set forth that on the previous Sunday morning the inhabitants of Arima—a district in the interior of the island—were thrown into a state of consternation by the news that three children had disappeared from the Ward of Guanapo during the past week. The names and residence of these children were given, as well as those of

every one concerned in the matter, down to the minutest corroborative details. Later in the day came the intelligence from Aripo that two more children had been lost, the one on Saturday and the other that same morning; further, that the mother had actually been the terror-stricken eyewitness of the capture of the second by a colossal snake, which had glided off with its victim into the depths of the forest.

A number of inhabitants quickly banded themselves together with the avowed object of destroying the fiend. Dogs were employed, and an attempt was made to track the serpent by scent, without success. The wildest rumours as to its dimensions and crimes began to prevail; but misrepresentation was modestly deprecated, and the length assessed at fifty feet. On the following Tuesday, frenzy was wrought to its highest pitch by a report, subsequently confirmed, that the anaconda had appeared on the heights, and that two more children had been carried off by him. A hunter had fired two charges of shot into him, the only result of which was to hasten his retreat in the direction of the Morne Bleu Mountains. The warden now thought the news so serious as to induce him to request assistance from the capital, and the Colonial Secretary accordingly despatched a sergeant and six policemen, armed with Martini-Henry rifles, by the afternoon train to Arima, as the guns which the majority of the pursuers carried did not seem to possess sufficient penetrating power to effect the slaughter of an animal endowed with more than feline plurality of lives. At six the next morning a motley cavalcade issued forth towards the Guacharo Caves in the Morne Bleu, where the monster had been 'marked down' on the previous evening; and here he was found and slain with a dramatic environment of the most picturesque horrors.

The search-party proceeded into one of the caverns as far as the light of day penetrated, walking with noiseless footsteps through a gloom and silence broken only by the sound of a distant waterfall and the mournful cry of the mountain birds. Suddenly their progress was arrested by a deep black pool of water, hardly to be discerned in the dim twilight. The dogs began to howl, and in a few moments they beheld, with vision now accustomed to the obscurity, the huge head of the snake rise above the inky surface, its eyes lighted with a diabolical gleam as it glared at the intruders. The next moment a hiss seethed forth from its jaws, as though a red-hot beam had been plunged in the water. A deafening volley rang out from the levelled guns, displacing large masses of stone overhead, which actually wounded some of the party. This, however, did not give the Minotaur his quietus, for, rearing himself twenty feet on high, and rapidly uncoiling his length from the depths of the pool, he launched himself forward, with his body bent in a great curve, on his assailants. A second discharge, however, produced the desired effect; the snake leaped out of the pool, and lashing the floor and the surface of the water, died in terrific convulsions. He was found to measure forty-seven feet, with a diameter of two and a half, the described colour accurately indicating an anaconda. Opened on the spot by the knives of some cocoa-pruners, it was found that

all traces of the children had disappeared; but the half-digested body of a deer, probably swallowed on the previous day, was disintombed, along with a number of official papers, conjecturally the relics of some unhappy overseer. The carcase of the serpent was then skinned, and the bones extracted for exhibition in the Council Hall of Port-of-Spain.

No contradiction of this extraordinary story seems to have reached any of the European or American papers which had quoted it; but my friend Dr Knox, of San Fernando, sent me the sequel. A couple of days after the publication of the narrative, crowds of people from far and near came flocking in to the Council Hall to view the hide and skeleton of this Brobdingnagian reptile, that being the date fixed for its arrival—only to find that the whole affair was a hoax, and to be reminded that the day was the first of April!

Quite recently a well-known venomous snake, the hamadryad (*Ophiophagus elaps*), has been amplified into a man-eater in certain forests of Ganjam, where, it is declared by the Khonds and Uriyas, who hold it in such dread that nothing will induce them to enter some of the woods, to attain a length of thirty feet, and to add not only human beings—which it is said to pursue with relentless activity—but jackals, wolves, leopards, and sambur to its normal diet of snakes.

In conclusion, let me give two possible instances as they were given to me of serpents devouring very young children. A friend of mine, whose *bona fides* I could not for one moment doubt, a man well known in the world of science, though not a zoologist, assured me that he had seen the tiny dead body of a newborn baby seized by a snake as it lay exposed on the steps of a church in a remote village of Southern Italy. He had passed the spot but a few minutes before, when the screams of a boy caused him to retrace his steps, and then he perceived a large striped serpent, which had plunged its widely distended jaws over the naked shoulder of the child. Sticks and stones caused it to loosen its hold, and it flashed away into the bushes. The biggest of the European snakes, the beautiful four-rayed *Elaphis*, is certainly found in that locality, but it grows to no more than six feet, and is of slender habit. My friend did not profess to have noted the appearance of the reptile sufficiently to enable him to describe it.

The other story comes from Manila. When I was there, many years ago, there was a poor crazy *mestiza*, or half-breed, who was quite a noted character in the island. She lived in one of the Tagal huts outside the city on the muddy Pasig River, but was not unfrequently to be met in the canopied side-walks of the streets, or wandering along the *calzada* in the evening, when that beautiful drive and promenade is thronged with carriages and pedestrians, enjoying the strains of the military band and the sea-breeze. This woman was a withered, shrivelled creature, who might have been sixty, seventy, or a hundred years old; but it was currently reported—and I can well believe it—that she was little more than thirty. Her wants were sufficiently provided for, and a certain amount of supervision was exercised over her movements; but every

now and then she escaped from a not very stringent control, and roamed through the length and breadth of Luzon, usually returning of her own accord after an absence of weeks, or even months, though occasionally rescued and brought back by those who encountered her and knew her.

Her one passion in life and the object of her wanderings was to catch snakes. These she would seize upon unhesitatingly wherever she met with them—and probably few knew their haunts better than she—and would keep them twisted about her, tied with plaited grass to her wrists or around her neck, or folded in the hem of her scanty *saya*, where she would talk to them, scold them, beat them, caress them, according to her mood, all day long, until they succeeded in regaining their freedom. On more than one occasion she had returned thus decorated to the Indian quarter, causing no little consternation; and it was even said that she had been responsible for a general stampede from the great Chinese store in the Calle Escolto, the Regent Street of Manila, by appearing at one of the doorways chattering to a huge poisonous snake. I was conducted to her hut by a Dominican friar who had described to me a serpent which he had recently seen in her hands, and which seemed to me to be a specimen of the rare and deadly *Ophiophagus*. Our tedious journey up the bewildering maze of fetid creeks which extend away to the base of the mountains was, however, fruitless, for neither *mestiza* nor snake was to be found in the nipa-thatched tenement. I learned from the friar that one of her arms, one leg, and her jaw had been broken by falls in the course of her snake-hunting rambles, and had remained permanently deformed from the want of surgical treatment; but that she was not known to have been bitten by any of the ill-omened protégés she handled so unceremoniously.

Concerning this woman I was told a tale of horror. True or false, no one in Manila appeared to question its accuracy. At the age of fifteen, when she was an exceedingly beautiful girl, she married a Spaniard high in office in the port, a member of one of the old 'Peninsular' families, who found it hard to forgive such a *mésalliance*. (This, I may remark, would possibly account for her position at the time of my visit, watched and cared for to a certain extent by an ample provision of money, but a pariah none the less.) A few weeks after the birth of her first child, she was taken, for the sake of her health, to a *quinta* or villa in the mountains, to escape the excessive heat and noisome smells of the city and low-lying foreshore, her husband's official duties compelling him to remain at their residence in the town. One afternoon she was sitting in a low rocking-chair, placed in a shady corner of the veranda which ran round two sides of the *quinta*, commanding an extensive view of the glorious bay far below; her Indian maid lay asleep on the floor, and she, with the baby, now a month old, in her lap, presently succumbed to the heat of the day, and slept too—slept long and heavily. She heard no sound; she was disturbed by no movement; but she woke suddenly, to find her baby gone, and an enormous python lying *gorged* at her feet. As she sprang from the chair, the snake struck her on the breast, inflicting a jagged

wound, the scar of which I saw, then sped off down the hill-side. With a wild cry, the poor creature fell to the ground, mercifully bereft of reason from that moment.

HOW THE ACREAGE RETURNS ARE OBTAINED.

IN September 1889 a Board of Agriculture was established in England for the first time. It took over the powers formerly exercised by the Agricultural Department of the Privy-council, and those of the Land Commission relating to tithes, commons, and the enclosure of lands. Its duties include the following matters: Contagious cattle diseases, injurious insects, the collection and preparation of statistics on agriculture and forestry, and the promotion of lectures and instruction on such subjects. The Board consists of the President, or Minister of Agriculture; the Lord President of the Council; the Secretaries of State for the Foreign, War, Home, and Colonial Departments; the First Lord of the Treasury; the Chancellor of the Exchequer; the Chancellor of the Duchy of Lancaster; the Secretary for Scotland, and such other persons as the Queen may from time to time appoint. One of the principal, if not the principal, duties of the Board is the preparation of the yearly 'blue-book'—it is, however, sometimes slate-coloured—containing the Agricultural Returns of Great Britain. These Returns have now been furnished for twenty-six years, and £15,300 was annually voted for their cost. The collection of the statistics has always been entrusted to the officers of the Excise branch of the Inland Revenue Department, who have until this year been paid for the extra work thus devolving on them, about ten thousand pounds being divided among the various officials concerned. The remuneration has now been withdrawn.

The particulars of the acreage of the land under cultivation for crops; the quantity of meadow, fallow, and moorland; the number of cattle, sheep, pigs, and horses of various kinds, poultry, and silos, are ascertained in the following manner. About the end of May each year, a form containing headed columns for all the items of information desired is sent by post by the local revenue officer to all persons whose names appear in the parish ratebooks as occupiers of land above a quarter of an acre in extent. These schedules are stamped, and addressed for return. After a few days, the officers proceed to write to or call upon such occupiers as have failed to make the required Returns, and endeavour to persuade them to fill up their papers or give verbally the necessary details. In the event of non-compliance, the particulars are obtained roughly from some friendly resident in the parish; or, in the absence of such assistance, the officer himself makes an estimate of the crops and live-stock on the farm or holding.

The difficulties of the collection have always been great, and have not much diminished as the

years have progressed; indeed, the inaccuracies are as great and as many as ever. In the Returns for 1889 the number estimated was stated to be 18,832 out of a total of 574,840 Returns; but there is no doubt that a much larger number—probably sixty per cent.—have to be amended, and partially, if not wholly, estimated, owing to various causes. The forms issued are of a very complicated nature, and well calculated to puzzle the agricultural mind, which, as John Bright once observed, is not very enlightened. Parish overseers sometimes put obstacles in the way of the collecting officials, to delay and prevent them revising their list of land occupants by the rate-books. It is entirely optional whether farmers and others fill up their Returns—there is no compulsion—only solicitation at present, though there is some talk of making the next Returns compulsory. In cases where the Returns are made, the forms are frequently so carelessly filled up that it is necessary for the officers to make additions or deductions in order to make the total average agree with that of the previous year. This operation is known as 'cooking' the Returns.

Another serious fact which retards the officials is that they have no right to go upon the land of a farmer to determine his crops and stock, and irate agriculturists have been known to threaten to set their dogs on too persistent officers. The thousands of prosecutions that take place all over the country for keeping dogs and carriages, killing game, carrying or using guns, &c., without licenses, and other violations of the revenue laws, render the officers unpopular with the very persons whose Returns they are requesting. An occupier of land after he has been fined will refuse to fill up an optional Return. The Returns were at first regarded, and still are by some, as preliminary to some dark scheme for future taxation, and by many as a partial check upon their income-tax declarations.

It is a matter of difficulty to the occupant of a large farm to give, even approximately, the number of acres under each crop, if he honestly desired to do so; it is therefore evident that it is impossible for officers with no special knowledge of agricultural matters, and frequently fresh from cities, to arrive at a reliable conclusion as to the crops and stock on a farm upon which they are not permitted to go, and of the boundaries of which they are ignorant. These Returns are required at a busy portion of the year, and are in addition to and unconnected with the other multifarious duties of revenue officials. Even if they were authorised to make personal inspection of the holdings of non-returning occupiers, it is doubtful whether many officers would have time to do so. The large number of Returns that require 'correction,' and holdings that have to be guessed at or estimates manufactured, are included in the totals with the Returns that profess to be correct, making the whole inaccurate, and thus of less value as a basis for the arguments, conclusions, and calculations regarding them which appear every year in the leading journals. The Board of Inland Revenue and the Board of Agriculture are aware of these defects in the Returns, and number among their advisers officials who have been through every grade of their service, to whom the difficulties

referred to are matters of actual knowledge. Moreover, year after year, in the columns of the Civil Service papers, have appeared letters from the collecting officers showing how impossible it is under the present conditions to obtain trustworthy Returns. It is apparent, too, under the circumstances mentioned, how hard it is for those concerned in their collection to obtain entirely correct Returns; and in order to get the work completed in the few weeks allowed much 'revision' of the schedules is inevitable.

In their anxiety, under the official pressure put upon them, to show as few 'estimates' as possible, the officers sometimes overstep the mark, and resort to expedients which bring down upon them punishment in the shape of dismissal, reduction in rank, and censures. This has, unfortunately for them, been especially the case over the last Returns, the punishments being exceptionally numerous and severe. The schedules sent out are often treated with scant respect by the recipients, being regarded as an objectionable inquisition, for which the Prime Minister who may be in power is responsible. Some contemptuously tear up the forms sent them, the fragments being found scattered about adjoining lanes, blown by every wandering wind. In other cases, instead of the information requested, ridiculous answers and satirical queries are freely scrawled on the forms. Instead of the extent of the land planted, '10,000 cabbages' will be returned. 'How is the G.O.M.?' one will humorously inquire. Another will ask, 'What is the price of jam?'—'If you want to know the number of my chucks, come and count them,' was endorsed on one form. A farmer's wife offered an officer chalk to mark the hens and chicks, as she could not tell their number 'to a hundred one way or the other.' The little pig that ran about so that he could not be counted has numerous parallels. Occasionally, some hitherto 'mute inglorious Milton' will 'drop,' like Silas Wegg, 'into poetry.' Here is a specimen of a rhyming Return, actually sent to one of the officers by a rural intellect of more than ordinary brightness and waggyry:

Ten acres of wheat; no barley or bere;
Eight acres of oats; rye (corn)? none here.
Of beans, peas, and 'taters,' I grow just a score,
And of turnips and mangolds about six or more,
Though of swedes I must tell you I have not a pole,
As the wireworms have paid their 'devours' to the whole.

Of carrots? let's see—I think there is one.
Cabbage? Not planted. Kohl-rabi not sown.
Rape? Well, not guilty. Beetroot enter nil.
Chicory—vetches or tares—no true bill.
To lucerne I'm a stranger; I sing not its praise;
But green crops such as rhubarb just one rood I raise.

Of flax not a yard; of hops not a pole;
Of fallow ploughed acres, I've four on the whole.
Of hay-crop—I've just got a score in the park,
Though of other grass land I could not sod a lark.
Working horses there's four, of cattle eleven,
Sheep I have none, but of gruntings I've seven.
Of silos? What nonsense to come to that pass,
The man who stacks ensilage I think him an ass.
The last-mentioned quadruped, sometimes call'd a moke,

I'm not to return, so forgive me the joke;
I know of a pair, sir, the compliment's double,
You for your patience, I for my trouble.

To the non-agricultural reader it may be explained that 'bere' is a light sort of Scotch

barley; 'kohl-rabi' and 'rape' are a species of green crop, and 'lucerne' an artificial grass for cattle.

Their employment in the collection of agricultural Returns is termed by the officers being 'on the acreage;' and in the days when there was a duty on malt instead of beer, it was a pleasurable duty roaming among villages and farmhouses on horseback or cycle, in dogcarts, or on that 'fiery and untamed steed' known as 'shanks' pony.' In the bright and pleasant summer-time the malthouses were always 'silent'—that is, closed, and the revenue officials had little to do in the rare June days. Now, however, all is changed, and the collection is regarded as an undesirable addition to their already heavy work. Various propositions for an alteration in the method of collection have been made. All agree that the Returns should be compulsory, with a fine for non-compliance or incorrect Returns. A simpler form of schedule, more suited to the understanding of Hodge, is also deemed necessary. It has been proposed, too, that the work of collection should be undertaken by the parish overseers, the police, or the postmen. A reform of the system prevailing is manifestly urgently required, and cannot come too soon, in the interests alike of agriculturists, revenue officials, and the public.

BALLADE OF ROSES AND THORNS.

THE month that brings the Summer heat
Unfolds the buds that filled in May;
The red flow of the morn is sweet,
And sweeter is the ebb of day.
So fair the pleasant land's array,
So deep the joy on every side,
That men forget this ancient lay,
'The roses pass, the thorns abide.'

Though hidden in a sure retreat,
The roses' blushes soon betray
Their secret, and the thorns that meet
Around them cannot once affray
The plunderer who seeks such prey,
For he will pluck them, and in pride
Upon his breast will wear the spray
Where roses pass, but thorns abide.

Alas! the hours have flying feet,
And Pleasure will not deign to stay
For anything that maids entreat,
For anything that men can say.
To sigh and prayer she answers 'Nay.'
All for her going must provide,
Or they will find to their dismay
That roses pass, but thorns abide.

ENVOY.

Princes, pluck roses on your way,
Though under thorns the roses hide;
Yet think ye on my rhyme, I pray—
'The roses pass, the thorns abide.'

THOMAS THE RHYMER.

WHAT Merlin the Prophet is to the Welsh, that Thomas the Rhymer is to the Scots. He is the *sacer vates* of Scotch tradition and history. His name, and the predictions associated with his name, are known and repeated in every district of Scotland. Though to Berwickshire is assigned the place of his birth, he is equally well known throughout all the Borders, from east to west. He is known in Strathclyde and Galloway, in the Highlands and Western Islands, along the north-eastern seaboard of Banff and Aberdeen, and among the peasantry of the Mearns, of Fife, and of the Lothians. There are few families of any antiquity or eminence, few castles or houses of distinction, but have attached to them some jingling rhyme or other, bearing upon their destiny, and attributed to the Rhymer. Some of these rhymes have the ring of antiquity about them, and are undoubtedly ancient; others smack of the modern method, and may be referred to the cunning or waggery of some local poetaster. But each and all of them serve to keep in memory a name that was long a name to conjure with in Scotland, and scarcely any great battle took place, or any striking crisis in the country's history occurred, but there was produceable some vague oracular prediction of the Rhymer's, pointing to what had happened or was about to happen. That these predictions were in many instances manufactured to serve the purpose of the hour, goes without saying.

While Thomas the Rhymer, or 'True Thomas,' has his parallel in Merlin the Prophet, yet an important distinction must be drawn between them. The one comes down to us on the wave of tradition only; the other is distinctly an historical personage. We have no fact of history to which we can point as evidence that Merlin ever actually lived; he may have simply been rendered the living channel and embodiment of Cymric legends and traditions—the creation of the Cymric imagination. But of the existence of Thomas the Rhymer we have reasonable historical

proof; his place of residence is moreover linked with a definite locality, and this not by tradition, but by an existing title-deed to the property dating as far back as the close of the thirteenth century, and containing his own name and the name of his son and heir.

The name of the Rhymer's residence was Ercildoune, now Earlston, on the banks of the Leader, in Berwickshire. The vale of Leader is of singular beauty, and embraces within it many places whose names have been made memorable in Scottish song and story. The Leader takes its rise in the Lanmermoor Hills, and flows southward in devious and wilful wanderings till it merges itself in the Tweed. Here we have the St Leonard's Banks and Leader Haughs of the seventeenth-century minstrel Burn, who gave to Wordsworth the measure and rhythm of his three Yarrow ballads. This stanza might not have done discredit to Wordsworth himself, in the grace and fervour of its lyrical melody:

Sing Ercildoune and Cowdenknowes,
Where Humes had ance commanding,
And Drygrange, with its milk-white ewes,
'Twixt Tweed and Leader standing;
The bird that flees through Redpath trees
And Gladswood's banks each morrow,
May sing and sigh sweet Leader Haughs,
And bonny holms of Yarrow.

It is to a district so hallowed about with song and tradition that Thomas the Rhymer belongs. He 'flourished'—to adopt a time-honoured locution—in the later half of the thirteenth century, or, more specifically, from perhaps 1220 to about 1290. The first fact as to his existence which has been ascertained is in connection with the witnessing of a charter which was granted to the Abbot and Convent of Melrose by Thomas's near neighbour, Petrus de Haga of Bemersyde, an ancestor of the ancient family regarding whom the Rhymer is said to have predicted that

Tyde what may betide,
Haig shall be Haig of Bemersyde.

And the prediction still holds good after the lapse

of six hundred years. The deed referred to, and which we have seen and handled, is now the property of the Duke of Buccleuch. It is a little bit of yellow parchment, nine inches by six, with the writing as clear and distinct as at the day on which it was penned, and has the remains of two seals attached to it by little separate tags of parchment. The one seal is that of the grantor of the charter, Haig; the other is that of Abbot Oliver of Dryburgh, who heads the list of witnesses. Deeds of this nature were not witnessed then as such deeds are now—that is, by each witness subscribing his signature beneath the document. In those days, writing was not so common an accomplishment as now, and probably to avoid invidious distinctions among men of hot and aristocratic tempers, with swords by their side, the clerk who engrossed the deed simply wrote therein a list of the men who were then present, and who had witnessed the transaction entered upon and completed. The last name mentioned of those who stood around the table on this occasion is *Thomas Rimor de Ercildun*.

Here, then, we have one solid historical fact upon which to base the actual corporeal existence of 'True Thomas.' The charter in question is not dated; but as it is ascertainable through other historical channels that the above Oliver was Abbot of Dryburgh in 1262, and was still Abbot in 1268, we are able to approach very near to the actual date when the Rhymer witnessed the charter—say, between 1260 and 1270.

The next transaction which brings the Rhymer upon the page of actual history belongs to the year 1286, and in this instance we have him in his traditional character of prophet. Walter Bower, who was Abbot of the Monastery of Inchcolm—an island in the Firth of Forth—wrote, in the first half of the fifteenth century, a history of Scotland, in which he tells us how Thomas of Ercildoune foretold the calamitous death of King Alexander III. The Earl of Dunbar of those days had a great castle which stood about a mile to the east of Ercildoune, and under the protecting shadow of whose walls a village would naturally spring up; the name of which village—Earl's-town—has gradually supplanted the older and more poetical Ercildoune. Thomas, paying a visit to the Earl one day, was asked by him half-jocularly what was to happen on the morrow. The Rhymer, sighing deeply, said: 'Alas for the morrow, a day of calamity and misery! Before the twelfth hour shall be heard a blast so vehement as shall exceed all that have yet been heard in Scotland.' The alarming nature of this prediction led the Earl and his associates to watch the atmosphere closely next morning; but the sky gave no sign of any impending storm, and by the ninth hour they were becoming disposed to regard Thomas and his prediction with something like contempt. The Earl, however, had scarcely sat down to dinner, and the hand of the dial pointed the hour of noon, when a messenger arrived at the gate, bringing with him the tidings of the king's death, who in the darkness of the previous night had been killed by a fall from his horse while galloping along the sea-

shore near Kinghorn. 'This,' said Thomas, 'is the wind that shall blow to you the great calamity and trouble of all Scotland.' And so of a surety it did; for it led to the disputed succession in the sovereignty of the kingdom, to the interference of Edward I. of England, to the long wars of Wallace and Bruce, the storm ending only in the victory of Bannockburn. 'This Thomas,' says a later chronicler, 'was a man of great admiration to the people, and showed sundry things as they fell. Howbeit,' he quaintly adds, 'they were aye hid under obscure words.'

The Rhymer is next referred to in an authentic document of the date 1294, in which his son, who styles himself 'Thomas of Ercildoun, son and heir of Thomas Rymour of Ercildoun,' conveys to a neighbouring charity all the lands which he held by inheritance in the village of Ercildoune. What the object of the younger Thomas was in thus divesting himself of his inheritance is not stated in the deed. But the natural inference is, that before this time, and before the son had entered on his inheritance, his father, True Thomas, was dead. Blind Harry, in his rhymed life of Wallace, represents the Rhymer as still alive in 1296 or 1297; but no one who knows the blind poetaster's method of writing history would give the slightest weight to his authority, as against a document which, on the face of it, presupposes that the Rhymer was dead previous to November 1294.

But while history has thus substantiated for us the actual existence and personality of Thomas the Rhymer, it has not informed us either as to the precise year of his death or as to the manner of it. But here tradition steps in and tells the story in a way more picturesquely and poetically than we should have had it from history. In view, moreover, of the methods of tradition, it is not quite consistent to speak of the Rhymer's 'death;' for, according to this type of legend, men like Merlin and Arthur and True Thomas do not die—they only pass from the sight of men for a time. Hence we have 'The passing of Arthur'—not his death—as he goes 'a long way' to the island valley of Avilion,

Where falls not hail, or rain, or any snow,
Nor ever wind blows loudly.

And tradition expected that he should once more return; as it, too, expected Merlin's release from the fatal spell woven round him by the wily Vivien.

And as tradition dealt with those, so it dealt with Thomas the Rhymer. The manner of his 'passing' was thus. At an early age he had been carried off to Fairy Land as the lover of the Fairy Queen, and while there had acquired his miraculous gifts of knowledge and of prophecy. At the end of seven years he was warned that it was time for him to return to earth; but his mistress made it a condition that he should come back to her when it pleased her to recall him from earth. One day, therefore, while Thomas sat in his house of Ercildoune, feasting and making merry with his friends, a person entered, and in a state of wonder and fear, informed him that a hart and hind from the neighbouring forest were 'composedly and slowly parading the street of the village. The prophet instantly rose, left his

habitation, and followed the wonderful animals to the forest, whence he was never seen to return. According to the popular belief, he still "drees his weird" in Fairy Land, and is one day expected to revisit earth.'

How far the actual sayings and doings of the Rhymer when on earth justified the extraordinary reputation which he obtained for his mingled gifts as a prophet and a poet, it is impossible now to say; but that that reputation was well established before his death is proved by the fact that a manuscript exists containing a prophecy said to be uttered by him, and which manuscript must have been written before 1320, probably before 1314, or within thirty years after his death. There are still extant two poems which have been ascribed to him. His authorship of one of these, called *Sir Tristram*, is more than doubtful; but the first portion of the other poem claimed for him—and which tells how he saw the Fairy Queen riding down by the Eildon tree, how he had kissed her lips, and how he wended his way with her to Fairy Land—may not improperly be regarded as his. The antique language in which it is couched will debar many readers from enjoying it; but, as poetry, it is of high quality, instinct with the colour and movement of life, with strong imaginative effects, and in places fervid with passion. The popular version of it which Scott received from a lady who resided near Ercildoune, and which he collated with another version in Mrs Brown's possession, may be regarded as a good paraphrase of the original poem composed by one who was familiar with that original.

True Thomas lay on Huntlie Bank;
A ferlie he spied wi' his e'e;
And there he saw a ladye bright,
Come riding down by the Eildon tree.

Her skirt was o' the grass-green silk,
Her mantle o' the velvet fyne;
At ilka tett of her horse's mane
Hung fifty siller bells and nine.

True Thomas hailed the fair lady with all a poet's gallantry. She told him she was the 'Queen of fair Elfland;' and he, in spite of her warning as to the consequences to himself, 'kissed her rosy lips, all underneath the Eildon tree.'

'Now, ye maun go wi' me,' she said;
'True Thomas, ye maun go wi' me;
And ye maun serve me seven years,
Through weal or woe as may chance to be.'

She mounted on her milk-white steed;
She's ta'en true Thomas up behind;
And aye, whenever her bridle rung,
The steed flew swifter than the wind. . . .

O they rade on, and farther on,
And they waded through rivers aboon the knee,
And they saw neither sun nor moon,
But they heard the roaring of the sea.

It was mirk mirk night, and there was nae sterner light,
And they waded through red blood to the knee;
For a' the blood that is shed on earth
Rins through the springs o' that countrie.

At the end of Thomas's services in Elfland, the Queen once more guides him back to earth, and offers him, as wages, the gift of 'the tongue that can never lie.' 'A goodly gift ye would gie to me,' replied Thomas, not having quite forgotten after his long absence what manner of place the

earth is. What use to a man among men would be 'the tongue that can never lie?'

'I neither dought to buy nor sell,
At fair or tryst where I may be.'

The situation is a little confused in the popular version, but is clear enough in the original poem. Scott himself has put in verse the Rhymer's final departure with the hart and hind:

Some said to hill, and some to glen,
Their wondrous course had been;
But ne'er in haunts of living men
Again was Thomas seen.

J. R.

THE IVORY GATE.*

BY WALTER BESANT.

CHAPTER XXIX.—'I KNOW THE MAN.'

'ANOTHER evening of mystery, Elsie?' said Athelstan.

'Yes. Another, and perhaps another. But we are getting to an end. I shall be able to tell you all to-day or to-morrow. The thing is becoming too great for me alone.'

'You shall tell us when you please. Meantime, nothing new has been found out, I believe. Checkley still glares, George tells me. But the opinion of the clerks seems on the whole more favourable, he believes, than it was. Of that, however, he is not perhaps a good judge.'

'They shall all be turned out,' cried Elsie. 'How dare they so much as to discuss'—

'My sister, it is a very remarkable thing, and a thing little understood, but it is a true thing. People, people—clerks and *le Service* generally—are distinctly a branch of the great human tribe. They are anthropoid. Therefore, they are curious and prying and suspicious. They have our own faults, my dear.'

All day Elsie felt drawn as with ropes to Mr Dering's office. Was it possible that after that long evening among the lessons of *Poverty Lane* he should remember nothing? How was she to get at him—how was she to make him understand or believe what he had done? Could she make the sane man remember the actions and words of the insane man? Could she make the insane man do something which would absolutely identify him with the sane man? She could always array her witnesses: but she wanted more: she wanted to bring Mr Dering himself to understand that he was Mr Edmund Gray.

She made an excuse for calling upon him. It was in the afternoon, about four, that she called. She found him looking aged, his face lined, his cheek pale, his eyes anxious.

'This business worries me,' he said. 'Day and night it is with me. I am persecuted and haunted with this Edmund Gray. His tracts are put into my pockets; his papers into my safe: he laughs at me: he defies me to find him. And they do nothing. They only accuse each other. They find nothing.'

'Patience,' said Elsie softly. 'Only a few

* Copyright 1892 in the United States of America by Harper & Brothers.

days—a day or two—then—with your help—we will unravel all this trouble. You shall lose nothing.'

'Shall I escape this mocking devil—this Edmund Gray?'

'I cannot promise. Perhaps.—Now, my dear guardian, I am to be married next Wednesday. I want you to be present at my wedding.'

'Why not?'

'Because things have been said about George: and because your presence will effectually prove that you do not believe them.'

'Oh! Believe them? I believe nothing. It is, however, my experience that there is no act, however base, that any man may not be tempted to do.'

'Happily, it is my experience,' said the girl of twenty-one, 'that there is no act of baseness, however small, that certain men could possibly commit. You will come to my wedding, then. Athelstan will give me away.'

'Athelstan? Yes; I remember. We found those notes, didn't we? I wonder who put them into the safe? Athelstan! Yes. He has been living in low company, I heard—Camberwell.—Rags and tatters.'

'Oh!' Elsie stamped impatiently. 'You will believe anything—anything, and you a lawyer! Athelstan is in the service of a great American journal.—Rags and tatters!'

'American? Oh! yes.' Mr Dering sat up and looked interested. 'Why, of course. How could I forget it. Had it been yesterday evening, I should have forgot. But it is four years ago. He wrote to me from somewhere in America. Where was it? I've got the letter. It is in the safe. Bring me the bottom right-hand drawer. It is there, I know.' He took the drawer which Elsie brought him, and turned over the papers. 'Here it is among the papers of that forgery. Here is the letter.' He gave it to Elsie. 'Read it. He writes from America, you see. He was in the States four years ago—and—and— What is it?'

'Oh!' cried Elsie, suddenly springing from her chair—'Oh! Do you know what you have given me? Oh! do you know what you have told me? It is the secret—the secret—of my fortune. Oh! Athelstan gave it to me—Athelstan—my brother!'

Mr Dering took the letter from her and glanced at the contents. 'I ought not to have shown you the letter,' he said. 'I have violated confidence. I forgot. I was thinking of the trouble—I forgot. I forget everything now—the things of yesterday as well as the things of today. Yes; it is true, child: your little fortune came to you from your brother. But it was a secret that he alone had the right to reveal.'

'And now I know it—I know it. Oh! what shall I say to him?' The tears came in her eyes. 'He gave me all he had—all he had—because—oh! for such a simple thing—because I would not believe him to be a villain. Oh! my brother—my poor brother! He went back into poverty again. He gave me all—because—oh! for such a little thing!—Mr Dering!' She turned almost fiercely upon him. 'After such a letter, could you believe that man to be a villain? Could you? Tell me! After such a deed and such a letter!'

'I believe nothing. My experience, however,

tells me that any man, whoever he is, may be led to commit'—

'NO! I won't have it said again.—Now, listen, Mr Dering. These suspicions must cease. There must be an end. Athelstan returned six weeks ago—or thereabouts. That can be proved. Before that time, he was working in San Francisco on the journal. That can be proved. While these forgeries, with which he is now so freely charged, were carried on here, he was abroad. I don't ask you to believe or to disbelieve or to bring up your experience—oh! such experience—one would think you had been a police magistrate all your life.'

'No, Elsie,' Mr Dering smiled grimly. 'There was no need to sit upon the bench; the police magistrate does not hear so much as the family solicitor. My dear, prove your brother's innocence by finding out who did the thing. That is, after all, the only thing. It matters nothing what I believe—he is not proved innocent—all the world may be suspected of it—until the criminal is found. Remove the suspicions which have gathered about your lover by finding the criminal. There is no other way.'

'Very well, then. I will find the criminal, since no one else can.'

Mr Dering went on without heeding her words.

'They want to get out a warrant against Edmund Gray. I think, for my own part, that the man Edmund Gray has nothing to do with the business. He is said to be an elderly man and a respectable man—a gentleman—who has held his chambers for ten years.'

'They need not worry about a warrant,' Elsie replied. 'Tell your brother, Mr Dering, that it will be perfectly useless. Meantime—I doubt if it is any good asking you—but—if we want your help, will you give me all the help you can?'

'Assuredly. All the help I can. Why not? I am the principal person concerned.'

'You are, indeed,' said Elsie gravely—'the principal person concerned. Very well, Mr Dering—now I will tell you more. I know the—the criminal. I can put my hand upon him at any moment. It is one man who has done the whole, beginning with the cheque for which Athelstan was suspected—one man alone.'

'Why, child, what can you know about it? What can you do?'

'You were never in love, Mr Dering—else you would understand that a girl will do a great deal—oh! a great deal more than you would think—for her lover. It is not much to think for him and to watch for him—and for her brother—the brother who has stripped himself of everything to give his sister!' She was fain to pause, for the tears which rose again and choked her voice.

'But, Elsie—what does this mean? How can you know what no one else has been able to find out?'

'That is my affair, Mr Dering. Perhaps I dreamed it.'

'Do you mean that you will get back all the papers—all the transfers—the dividends that have been diverted—everything?'

'Everything is safe. Everything shall be restored.—My dear guardian, it is a long and

a sad story. I cannot tell you now. Presently, perhaps. Or to-morrow. I do not know how I shall be able to tell you. But for your property, rest easy. Everything will come back to you—everything—except that which cannot be stored in the vaults of the Bank.'

The last words he heard not, or understood not.

'I shall get back everything!' The eyes of the Individualist lit up and his pale cheek glowed—old age has still some pleasures. 'It is not until one loses Property that one finds out how precious it has become. Elsie, you remember what I told you, a day or two ago. Ah! I don't forget quite everything—a man is not the shivering naked soul only, but the complete figure, equipped and clothed, armed and decorated, bearing with him his skill, his wit, his ingenuity, his learning, his past, and his present, his memories and his rejoicings, his sorrows and his trials, his successes and his failures, and his Property—yes—his Property. Take away from any of these things, and he is mutilated: he is not the perfect soul. Why, you tell me that my Property is coming back—I awake again. I feel stronger already; the shadows are flying before me: even the terror of that strange forgetfulness recedes: and the haunting of Edmund Gray. I can bear all, if I get my Property back again. As for this forger—this miscreant—this criminal—you will hale him before the judge!'

'Yes—yes. We will see about the miscreant afterwards. The first thing is to find the man and recover your Property, and to dispel the suspicions resting on innocent persons. If I do the former, you must aid me in the latter.'

'Assuredly. I shall not shrink from that duty.'

'Very well.—Now tell me about yourself. Sometimes it does good to talk about our own troubles. Tell me more about these forgetful fits. Do they trouble you still?' Her eyes and her voice were soft and winning. One must be of granite to resist such a voice and such eyes.

'My dear'—Mr Dering softened. 'You are good to interest yourself in an old man's ailments. It is Anno Domini that is the matter with me. The forgetful fits are only symptoms—and the disease is incurable. Ask the oak why the leaves are yellow.—It is the hand of winter. That is my complaint. First the hand of winter, then the hand of Death. Meantime, the voice of the grasshopper sings loud and shrill.' In presence of the simple things of age and death, even a hard old lawyer grows poetic.

'Tell me the symptoms, then. Do you still forget things?'

'Constantly. More and more. I forget everything.'

'Where were you yesterday evening, for instance?'

'I don't know. I cannot remember. I have left off even trying to remember. At one time I racked my brains for hours, to find out, and failed. Now I remember nothing. I never know when this forgetfulness may fall upon me. At any hour.—For instance—you ask me about yesterday evening. I ordered dinner at home. My housekeeper this morning reminded me that I did not get home last night till eleven. Where was I? Where did I spend the evening?'

'At the Club?'

'No—I took a cab this morning and drove there under pretence of asking for letters. I asked if I was there last night. The hall porter stared. But I was not there. I thought that I might have fallen asleep here. I have done so before. Checkley tells me that I went away before him. Where was I?—Child!—he leaned forward and whispered, with white cheeks—'I have read of men going about with disordered brains doing what they afterwards forget. Am I one of these unfortunates? Do I go about with my wits wandering? Oh! horrible! I picture to myself an old man—such as myself—of unblemished reputation and blameless life—wandering about the streets demented—without conscience—without dignity—without self-respect—committing follies—things disgraceful—even things which bring men before the law'—He shuddered. He turned pale.

'No—no,' murmured Elsie. 'You could not. You could never'—

'Such things are on record. They have happened. They may happen again. I have read of such cases. There was a man once—he was like myself—a Solicitor—who would go out and buy things, not knowing what he did. He bought new hats—every day twenty new hats—cricket bats, though he was long past the game of cricket: once he bought six grand pianos—six—though he knew not the use of any instrument. Then they gave him a companion, and he found out what he had done. The shame and the shock of it killed him. I have thought of that man of late. Good Heavens! Think, if you can, of any worse disaster. Let me die—let me die, I say, rather than suffer such a fate—such an affliction. I see myself brought before the magistrate—me—myself—at my age, charged with this and with that. What defence? None, save that I did not remember.'

'That could never be,' said Elsie confidently, because she knew the facts. 'If such a thing were to befall, your character would never be changed. You might talk and think differently, but you could never be otherwise than a good man. You to haunt low company? Oh! you could not even in a waking dream. People who dream, I am sure, always remain themselves, however strangely they may act. How could you—you—after such a life as yours, become a hunter of low company? One might perhaps suppose that Athelstan had been living among profligates because he is young and untried—but you?—you? Oh! no. If you had these waking dreams—perhaps you have them—you would become—you would become—I really think you would become'—she watched his face—'such—such a man as—as—Mr Edmund Gray, who is so like yourself, and yet so different.'

He started. 'Edmund Gray again? Good Heavens! It is always Edmund Gray!'

'He is now a friend of mine. I have only known him for a week or two. He does not think quite as you do. But he is a good man. Since, in dreams, we do strange things, you might act and speak and think as Edmund Gray.'

'I speak and think as— But—am I dreaming? Am I forgetting again? Am I awake? Edmund Gray is the man whom we want to find.'

'I have found him,' said Elsie quietly.

'The forger—if he is the forger'—

'No—no. Do not make more mistakes. You shall have the truth in a day or two. Would you like to see Edmund Gray? Will you come with me to his Chambers? Whenever you call, you—you, I say—will find him at home.'

'No—no. I know his doctrines—futile doctrines—mischievous doctrines. I do not wish to meet him. What do you mean by mistakes? There are the letters—there are the forgeries. Are there two Edmund Grays?'

'No—only one. He is the man they cannot find. I will show you, if you like, what manner of man he is.'

'No. I do not want to see a Socialist. I should insult him.—You are mysterious, Elsie. You know this man, this mischievous doctrinaire—this leveller—this spoliator. You tell me that he is a good man—you want me to see him. What, I ask, do these things mean?'

'They mean many things, my dear guardian. Chiefly they mean that you shall get back your Property, and that suspicion shall be removed from innocent persons—and all this, I hope before next Wednesday, when I am to be married. We must all be happy on my wedding day.'

'Will—will Mr Edmund Gray be there as well?'

'He has promised.—And now, my dear guardian, if you will come round to Gray's Inn with me, I will show you the Chambers of Mr Edmund Gray.'

'No—no. Thank you, Elsie—I do not wish to make the personal acquaintance of a Socialist.'

'He has Chambers on the second floor. The principal room is large and well furnished. It is a wainscoted room with two windows looking on the Square. It is not a very pretty Square, because they have not made a garden or laid down grass in the middle—and the houses are rather dingy. He sits there in the evening. He writes and meditates. Sometimes he teaches me, but that is a new thing. In the morning he is sometimes there between nine o'clock and twelve. He has an old laundress, who pretends to keep his rooms clean.'

She murmured these words softly, thinking to turn his memory back and make him understand what had happened.

'They are pleasant rooms, are they not?' He made no reply—his eyes betrayed trouble. She thought it was the trouble of struggling memory.—'He sits here alone and works. He thinks he is working for the advancement of the world. There is no one so good, I think, as Edmund Gray.'

He suddenly pushed back the chair and sprang to his feet.

'My Scholar! You speak of me?'

It was so sudden that Elsie cried out and fell backwards in her chair. She had brought on the thing by her own words, by conjuring up a vision of the Chambers. But—the trouble was not the struggle of the memory getting hold of evasive facts.

'Why, child,' he remonstrated, 'you look pale. Is it the heat? Come, it is cooler outside. Let us go to the Chambers in Gray's Inn. This old fellow—this Dering—here he sits all day long.

It is Tom Tiddler's ground. It is paved with gold, which he picks up. The place—let us whisper—because he must be in the outer office—it reeks of Property—reeks of Property.'

He took his hat and gloves. 'My Scholar, let us go.' With the force of habit, he shut and locked the safe and dropped the bunch of keys in his pocket.

(To be continued.)

A PENNY IN THE SLOT.

THE latest automatic novelty is a contrivance by which gas is supplied to small consumers on putting 'a Penny in the Slot.' We are all familiar with the bewildering development which has of late taken place in this system of retailing various commodities. At most railway stations and other public places there are automatic machines, which, if set agoing by the deposit of the essential coin, will show your height or weight, test your pulling strength, give you an electric shock, tell your fortune, or supply you on demand with a box of matches, packets of chocolate, confectionery, cigarettes, cigars, sheets of note-paper, postcards, postage stamps, or other articles of more or less utility. The same principle is now being applied to save householders of modest means from the recurrence of quarterly gas bills. In many towns the tenants of small houses have hitherto been deterred from using gas on account of the first cost and the periodical mode of payment. That difficulty is overcome by the prepayment meters, of which various types are being largely furnished in different towns by rival patentees and manufacturers. Their mechanism is said to be extremely simple, and such as can be readily attached to the top of any existing meter. All the consumer has to do is to turn a small handle, drop a penny in the slot, and the equivalent value in gas immediately has access to the meter. But the purchase need not be so limited. More than one penny can be deposited for larger supplies. Each meter, besides the automatic arrangement, comprises an ordinary register for every foot of gas consumed, the dial and pointer showing the quantity in reserve and how much has been expended. In Liverpool alone, more than four thousand of these new prepayment meters are now in successful daily use; indeed, there is some difficulty in supplying enough of them to meet the growing demand from that city, as well as from London, Manchester, Birmingham, Bolton, Blackburn, and other places.

Noteworthy as some of these automatic novelties are, they were equalled in cleverness and ingenuity by those of olden time. There is, however, one material difference. Nowadays they are being more and more applied to useful purposes, whereas during the boyhood of our grandfathers they were mainly designed to mystify or amuse. One of the most perfect of the machines which used to puzzle and entertain our ancestors was constructed by M. Vaucanson, and exhibited at Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes of twelve different tunes with its fingers, in the same manner as any human player. In 1741 he made a flageolet-player, which with one hand beat a

tambourine, playing twenty country-dances; and in the same year he produced a wonderful automatic duck. It was made to conduct itself on the water in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, &c., as naturally as its live companions. Most wonderful of all, by means of a solution in the stomach it actually appeared to digest its food! This illusion was, however, exposed by Robert Houdin, the celebrated conjurer, into whose hands Vaucanson's duck was placed for repair. He found out that the so-called digestive process was brought about by a vulgar trick unworthy of its inventor, who was beyond doubt a clever mechanician.

A Swiss named Droz made for the king of Spain a sheep that bleated, and a dog which guarded a basket of fruit. If any of the fruit was taken away, the dog barked incessantly until it was replaced. He also made a singing bird; but it was quite eclipsed by another made by Mailardet.

Nothing is more difficult than to construct any mechanism to imitate the human voice. Attempts have, however, been made with some measure of success. A certain Abbé—Mical by name—is said to have made two large heads of brass which could clearly pronounce two or three complete sentences; but this is nothing to what Edison's phonographic dolls can now accomplish. Mical wanted the French Government to buy his speaking heads. The Government, however, declined to do so; and the unfortunate artist, burdened with debts, smashed them in a moment of despair, and died in a destitute state in 1786. Some years previously he had presented to the Science Academy at Paris two other heads which articulated syllables. They had an ingenious imitation of the human throat and vocal organs. Descartes constructed a clever automaton which represented the figure of a girl. He called it his daughter Francine. During a voyage the captain had the curiosity to open the box in which Francine was enclosed. His interference set the works going. This so alarmed him that he threw her into the sea, fearing she was an instrument of magic, or inspired by the devil.

The first automata actually authenticated do not date farther back than the beginning of the last century. But there are some traditions of marvels of the kind at a much earlier period. It is said, for instance, that an artificial eagle was constructed which flew before the Emperor Maximilian when he was entering Nuremberg. Roger Bacon is reported to have forged a brazen head which could speak some words, and acted in fact as a doorkeeper. It was broken to pieces by Aquinas. Knauss exhibited at Vienna an automaton which could write; but it was not equal to a long letter, and there was no variety in its composition. Two inventors named Kauffman and Maelzel made a couple of automatic trumpeters which could play several marches. One of the ancients is said to have made an iron fly, which could flutter round the room and return to his hand.

Returning to the more reliable records of modern times, some of our readers may remember the piping bullfinch which was first shown at the London Exhibition in 1851. It was a perfect example of those automata, now more numerous,

which imitate the movement and song of birds. It was contained in a box not much bigger than a snuff-box. When the spring was touched, a tiny bird sprang out, fluttered its wings, and trilled the true pipe of the bullfinch. The sound in reality came from the box, not from the bird itself. It was indeed an elaborate adaptation of the same principle as is applied to the mechanical cuckoo in the well-known Swiss clocks.

Of late years all previous efforts in the making of automata have been surpassed by Mr J. N. Maskelyne, who may be truly said to have commenced a new era in these marvels. His first one, Psycho, was introduced to public notice in January 1875. It was a seated figure of light construction, which moved its head, and from a rack in front of it chose the cards necessary for a hand at whist, which it played in a masterly manner. It also worked out calculations up to 100,000,000, showing the total in a box by opening a sliding door. It acted without any mechanical connection with anything outside of it, and yet was so much under control that it carried out orders, as if with intelligence. How it worked was a profound secret, even to Mr Maskelyne's assistants. In 1877 the same gentleman produced Zoe, another wonderful automaton. During the performance there was placed in front of it a sheet of drawing-paper upon which it traced the likeness of any public character chosen by the spectators from a list of two hundred names. Mr Maskelyne has constructed some automata which play upon musical instruments. Automatic chess-players have also been made. A remarkably clever one was exhibited some years ago at the Crystal Palace. Elaborate automata of the old style were very expensive, and the curiosity of the public was not sufficiently long sustained to repay the outlay. We have now reached a time when simpler and less complex mechanism is commonly applied in a practical way to more utilitarian purposes than in bygone times.

THE BELLS OF LINLAVEN.

CHAPTER V.—THE SACRIFICE.

EVENTS had moved rapidly that afternoon in Linlaven. Within the vicarage all was confusion and distress. When Clara recovered sufficiently to remember what had happened—the reading of the paper—the finding of the watch, which, she felt convinced, must have been her father's—the terror-stricken face of Uncle Giles as the report was read out—all came back to her vividly, and the first use which she made of her returning consciousness was to ask her husband to go and find that old man at once. She felt that she had read her fate in his face.

Captain Norham had left the house on this errand, when his attention was arrested by a rider coming rapidly down the drive from Brathrig Hall. It was Mr Brookes. He had been summoned to the death-bed of Dame Norham that morning, and now he had ridden down to the vicarage to say that all was over.

'What is to be done?' asked the Captain.

'Nothing can be done, so far as I can see,' replied the lawyer. 'Linley will have taken

possession by Monday, and the estates will go to a man who has scarcely any reasonable claim to them, except that he was remotely connected with the Norhams by the female line, and that the old lady has made a will in his favour.'

'But might not the will be disputed?—Look here.' And he took from his pocket the paper which Lawrence Dale had been reading from. He opened it, pointed to the paragraph, 'Remarkable Discovery,' and passed it to the lawyer.

Mr Brookes read the paragraph twice over carefully, and not without some expressions of astonishment. 'Extraordinary—startling—watch belonged to one Arthur Naseby—real name Arthur Norham—the first clue we have got to all this mystery.—But, George,' he said, turning to the Captain, 'this may all come to nothing. We cannot tell whether Arthur Norham is dead or alive—or, if dead, when he died. Then where are we?'

Captain Norham narrated to him what he and his wife had seen that afternoon as the paper was being read—the agitation of the old man who was a stranger in the place—also what he himself had seen in the church, as well as the fact that this man, when in his delirium, had called Clara by her mother's name.

'There is something strange, certainly, in all this.—Go, George, and find this man, and bring him to the vicarage. We must at least speak with him on the matter.'

Uncle Giles was not to be found. His cottage was empty. No one had seen him since afternoon. 'But, Captain,' said Mrs Dale, 'he often walks of an evening round the head of the lake to Langley Bridge, and he may ha' gone there now.'

The Captain walked off in the direction indicated; but he saw no one. He reached the bridge, and stood for a little upon it, meditating on the distracting events of the day. The sun had now set, and twilight was rapidly deepening. The silence was for a time unbroken save for the rushing sound of the brook as it swept beneath the bridge; then there came the sounds of hurrying footsteps. In a few minutes a man appeared, shouting something which in the distance the Captain was unable to catch. The man, however, instead of coming on straight towards him, turned up by the road that led to the church; and shortly thereafter the bells rang out from the tower with unwonted violence and clamour.

It at once occurred to Captain Norham that fire had broken out somewhere. Little did he know how terrible to his own heart and Clara's the result of that fire might be.

When he entered the village, all was turmoil, commotion, and alarm. The Old Grange was on fire. A woman was flying towards Lawrence Dale's cottage. It was Lucy Norham's nurse.

'Oh, Lawrence,' she cried, 'have you seen our Lucy? I have been out at tea at Millridge Farm, and when I came home she was not to be found.'

'I ha' not seen her, lass,' replied Lawrence, as he walked off towards the fire; 'but thou may keep thy mind easy. She be safe enough somewhere with old Giles.'

Captain Norham also hurried on towards the burning edifice, in front of which every living creature in the village had now congregated, the

women uttering loud exclamations of distress and alarm, and the men hurrying hither and thither, vainly suggesting expedients for checking the fire. When they saw Captain Norham approach, they waited for his directing hand.

'We cannot save the old building,' he said, after a quick survey of the situation; 'but its connection with the mill must be cut off.' And under his orders, some wooden and other temporary structures that had been erected between the Grange and the mill were forthwith torn down and removed by willing hands. Upon the Old Grange itself the fire had already got a firm hold; the ancient time-dried woodwork of its floors, with the various combustible materials stored in it, fed the fire with fierce rapidity, and in an almost incredibly short space of time the flames had burst forth from the lower range of windows, threatening the whole building with immediate destruction.

In this crisis Captain Norham felt a hand on his arm. It was Clara, with anxious eyes, asking if no one had seen Lucy.

'Miss Lucy?' said a bystander. 'She will be wi' Uncle Giles. I saw her a-seeking for him i' the afternoon.'

'No, ma'am,' said a lad who had overheard the conversation; 'Miss Lucy be not with Uncle Giles, for I saw him a-goin' up the Fell more 'n an hour ago, and there was no one wi' him.'

'Oh, my child, my child,' cried Clara, 'where can she be?' And she looked at the door of the burning building, as if she even dared go into the jaws of death itself in quest of her child. Captain Norham stepped forward in order to draw his wife back from the crowd. At that moment, a tall man, with uncovered head, and white hair streaming in the wind, dashed in amongst them.

It was Uncle Giles.

Clara was at his side in an instant. 'Oh, Giles,' she cried, with wild eagerness, 'have you seen our Lucy?'

'Yes,' he replied, and there was a kind of preternatural calmness in his demeanour, like that of a man who has strung himself up to the doing of a great action—'yes, I ha' seen her; and wi' God's help I shall see her again.'

And before the onlookers had time to take in the full significance of his words, he had made a dash forward into the red-illuminated space, and disappeared within the doorway of the burning edifice.

Clara, with lightning rapidity of perception, gathered from his words and his mad action that her child was there—within these blazing walls. The knowledge was too much for her already overstrained powers, and she sank back in her husband's arms, like one dead.

Meanwhile, the crowd looked on with breathless anxiety. They had seen the man enter the red doorway, to struggle upwards through the fiery furnace: should they ever see him return? 'The stairs must be burning,' said one. 'It is the foolhardiness of a madman,' said another. And as yet there had been no sign from within the building. From moment to moment the flames belched forth in their red fury, and at other times the whole building seemed to be covered with a cloud of smoke and fire. A few moments more elapsed, and there was heard the crashing of glass in the upper storey, and through

a gap in the curling smoke the white hair of the brave old man was seen at the open window. A half-suppressed cheer burst from the crowd; but the event was too greatly fraught with peril and anxiety for any long indulgence in exultation.

They heard his voice up there at the window. 'The child is here,' he cried; 'but the stair is burning, and I cannot return that way. Send me up a rope.—There!' And he flung a ball of cord from the window out amongst the crowd, retaining the loose end of the ball in his hand. 'Fasten a rope to it,' he shouted again; 'and for the bairn's sake be quick.'

Almost in shorter time than we can tell it, a rope was made fast to the cord, and Giles was drawing it up towards him. The people awaited with breathless suspense till he reappeared at the window. At last—he is there! The child is in his arms, wrapped up in some large covering for its better protection. He leans forward for a moment to watch when the lower windows are clear of flame, and then the child is seen to be descending through the air. Quickly, but yet cautiously, does the old man pay out the rope upon which depends the life of this little burden, so precious to his heart. A score of hands are held up to receive it; and as Lucy is safely rescued and placed in her mother's arms, tears might have been seen on many a sunburned face.

Before this had been more than done, it was observed that the man who had saved the child, high up in that place of danger and death, was attaching the rope to something within the building, and was himself preparing to descend. The first part of the descent on the rope was made, hand over hand, quickly and skilfully, 'as if he had been a sailor all his life.' So said an onlooker. But just when he had reached the windows of the second floor, the fall of some portion of the interior sent a fierce volume of flame with a suffocating rush from the shattered windows, half enveloping the descending man. He was seen to make an unsteady clutch at the rope, but missed it; and, to the horror of the spectators, in another second he had fallen heavily, with a dull thud, to the ground.

'He saved others'—came from amidst the crowd in deep, tremulous tones. It was the Vicar who had spoken, standing there with white uncovered head.

There was mounting and riding in Linlaven that night. A doctor had to be brought from a distance, as also a Justice of the Peace; for Mr Brookes, with lawyer-like instinct, having been informed of all that was known and suspected about the old man now lying once more unconscious on his bed, thought it well to be prepared for any emergency that might arise. If this man, as would appear from what had been seen by Clara and her husband that day, knew 'Arthur Naseby,' a clue might be found to some of the hidden mystery of the lost Arthur Norham's life.

Two hours elapsed before the doctor and the magistrate arrived. The former immediately proceeded to examine into the injured man's condition, and after a time pronounced his injuries fatal. He might possibly live till morning, but could not live long.

Clara stood by the bedside, watching with more than womanly solicitude. This man, whoever he was, and whatever he may have been, had saved the life of her child at the cost of his own; and as she thought of this, and all his tender ways aforetime towards the little Lucy, her heart went out to him in deep love and compassion.

Slowly the hours moved on, one by one, and still the sufferer gave no sign of returning consciousness. The night passed, and the gray dawn began to show itself at the window; whereupon Lawrence Dale raised the blind, extinguished the lamp, and allowed the soft fresh light to enter the room. Gradually a flush of rosy brightness kindled in the eastern sky, and then the sun himself came up over the hills, shedding a golden halo through the curtained window on the pale face resting there before them—so calm, yet so death-like in its rigid lines. Clara thought of that morning when she first looked upon it—not more death-like now than it was then; and a faint hope quivered in her breast for a moment, as she thought it possible that he might yet live. Before she was aware, she found that he had opened his eyes, and that they were resting full upon her.

'Ah, Esther,' he said, in faint tones, 'it be thee. I knowed thou would find me at last.'

Then the eyes again closed, and he lay thus for some time. When he once more looked up, he seemed to recognise his surroundings, and asked in an anxious voice: 'Where be little Lucy? Ha' thou found her?'

'Yes,' replied Clara. 'Thanks to you, Giles, she is sleeping safe and sound in her little crib.'

'Thank Heaven, and not me, missus. It were me as left her in danger; and her death would ha' been another burden on my soul. God knows I ha' enough.'

A look from Mr Brookes to Clara indicated that the time had come when she might now speak.

She went forward to the bedside and said softly: 'Giles, you have twice called me Esther, and I am wondering why.'

A strange look passed over the man's face, as if he were suddenly brought into touch with some great sorrow; but he remained silent. He lay thus for a little; then, as if communing with himself, he said: 'It were true as the preacher said: "Be thou ever so fleet o' foot, the vengeance o' God is fleetier." It ha' come up wi' me now, and I cannot die with the burden on my soul.'

His eyes moved slowly round the room until they rested on Lawrence Dale, and he said to him: 'Thou remembers what was in the paper thou read from, about the *White Horse*, and the finding o' the watch?'

Lawrence nodded, but did not speak.

'Then my time ha' come, and I must tell it all.'

While this was proceeding, Mr Brookes had got paper and ink in readiness; and, although the story was told by the dying man in slow words, and after long intervals, it was to the following effect:

In that year of Revolutions, 1848, this man, who now gave his name as Giles Barton, had

become a member of a society which, although its aims were to benefit the social condition of working men, was in reality a secret and somewhat dangerous combination. The members were enrolled under feigned names; and one of these members was Arthur Naseby. On one occasion, two or three years later, a riot broke out in the street, and Giles was seized among others by the police; whereupon Naseby had headed a rescue party, and carried the prisoners off while on their way to the police office.

It was a time when Government was very severe upon such offences; and Giles and Arthur Naseby fled. Grateful for the liberty which had thus been secured to him, the former advised Naseby to go to Stockborough, in Yorkshire, where he would find refuge with Giles's aunt, Mrs Hales. He himself would take passage in a vessel as a marine engineer, and leave the country for some years. He gave Naseby a letter to his aunt, also a message to his cousin Esther, his aunt's only child. Esther he had loved from his boyhood, though he had never spoken of it to her, for she was well educated, and he but indifferently so; yet he imagined there was a sort of understanding between them, and fondly hoped that, by industry and success, he might some time be in a position to ask Esther Hales to be his wife. The winning of her love had been the dream and the ambition of his life.

He remained abroad for nearly two years, returning to England towards the end of 1853, when he wrote to Arthur Naseby, saying that he was most anxious to visit his aunt and cousin, and asking if it was safe for him yet to do so. He was afraid the police had not forgotten him. In reply he received a letter stating that inquiries had quite recently been made in the town regarding him, and not in the meantime to come nearer Stockborough than the village of Bromley, a few miles to the south. Here he received a second letter from Arthur Naseby, stating that the writer, after an absence of two days, was returning home to Stockborough, and would meet with him on the following evening, after dark, at a place indicated, between Stockborough and the *White Horse Inn*.

'He came,' said the old man, addressing Clara; 'and how can I tell thee what took place between us? All these years, and all the way home, I had been thinking of Esther Hales; I had done well, and my heart was set upon winning her—more'n tongue can tell. And when I met him, and found as how he had married her—the man who had carried my last message to her—I think I mun ha' gone stark mad. I mun ha' threatened him; for he throwed his arms around me to keep me from striking him; but in my madness I shook him off, dashing him to the ground. We were on the road by the river-bank; and when he staggered from me, and fell, he rolled down the bank into the river. The night was dark, and I could not see him, and the river was in high flood. I only heard the splash in the water, and his wild cry.—This brought me summ't to mysen, and I saw the terrible thing I had done. I had been the death of the man who had been my friend till this wild love o' mine for Esther Hales came between us.

'I ran wildly along the water's edge; but nowt o' my old mate could I see. I called

for help, but no one came. I said, "I am a murderer!" A great fear came upon me, and I turned and ran off through the darkness, I knowed not where. At last I saw lights. It was the *White Horse*, and I went in. There were voices loud in the bar-room; but no one mun ha' seen me, and I went into the Blue Room. In the light of the fire, what was my horror to find a watch dangling at the end of a bit of chain that had fixed itself to a button of my coat? It was the watch o' the man whose death I had been! I could scarce handle it, for it looked in my eyes as if red wi' blood, and I a'most sickened at the sight of it. I tore it from its fastening, and looked about to see where I could hide it. There was a broken part in the wainscoting, and I dropped it down there, and rushed from the house.

'Ah, that runnin' away was the one great mistake o' my life! But I could not go back to Stockborough, and look on Esther Hales, and know that I had been the death o' the man who loved her—the man, too, as was my friend. I fled; and summer and winter, from year to year, I ha' been trying to fly from mysen ever since. How I wished to die that night in the storm on the Fell! Yet here, in Linlaven, I ha' been a'most happy—happier than I ha' been for all these thirty years; for I found folks as were kind to me; and I loved thee—and thy bairn. But the coat-of-arms on the tombstone in the church gave me a great scare; for they were the same as was on the last letter Arthur Naseby wrote me. And when the story was read from the paper o' the finding o' the watch, I said to mysen: "I will fly from my fate no longer," and was agoin' to tramp to Stockborough, to give mysen up, when the bells called me back. I knowed where thy little Lucy was, and I could not leave her to perish.'

Clara asked him if he had still Arthur Naseby's letters.

He put his hand into his breast and drew out the little leather case. There first fell out the tress of fair hair he had shorn from Lucy's head, which he held out his hand to receive back, and pressed to his lips; and then two letters. Both, the Vicar saw at once, were in the handwriting of Arthur Norham. The latest one, in which he had named the final and fatal place of meeting, was, curiously enough, written on the back of the last letter which the Vicar had written to Arthur before his disappearance, and which had the Norham arms stamped upon it. Arthur's letter was dated, 'Christmas Eve, 1853.'

'That is sufficient,' whispered Mr Brookes to the Captain; 'it forms indisputable proof that Arthur Norham was alive after the time of his father's death. Consequently, he was the heir of the Brathrig estates according to his father's will. We can beat off Linley now, and the estates are safe.'

But Clara heard nothing of this. She was intent upon every word that fell from the lips of the dying man.

'Thou knows now,' he said, 'the story o' my miserable life; and I feel easier in my heart that I ha' told thee of it.'

Clara went close up to him, and took his hand. 'Giles,' she said, 'Esther Hales was my mother.'

'Thy mother?—Ah!' And he looked as if a great light had burst in upon him. 'Thou be Esther Hales's child?—and Lucy be thine?—little Lucy?'

He lay silent for a while, and then said: 'Yes, that be it. I knowed there was summat about thy little Lucy as went beyond me. I see it all now. She ha' Esther Hales's eyes—my Esther's. —And yet,' he added, looking at Clara as if in fear, 'I were the death o' thy father.'

'And you have atoned for it,' said Clara, stooping and kissing the brow of the dying man, 'for you have saved my child—and hers.'

Some hours after, as they stood by the bedside, watching his last moments, there stole along upon the sunbright air the sound of Linlaven bells—not harsh and dissonant, as on yestereven, but soft and melodious, like the winged messengers of peace and forgiveness. Once more, as on that other Sabbath morn, came the clear melody of the bells, filling all the room with their sweet jargon; and the eyes of the dying man opened, and his lips were seen to move. He was saying '*Our Father!*' Was he once more in the old church at home by his mother's knee, with his hand in hers, the sunshine and the pleasant music filling all the place? Again the penitential words are on his lips: '*Forgive us our sins!*'— And again a great change has come, 'quick and sudden-like.' But not surely this time into Darkness. Rather, let us hope, into the Day that knows no evening, into the Light that has no eclipse.

'UNCLE GILES.' That was the name by which they had known and loved him; it is the name you may still see carved upon the little headstone above his grave; and that grave is in the place which of all places was most pleasant to him—within the sound of 'them beautiful bells,' the Bells of Linlaven.

THE END.

THE MONTH:

SCIENCE AND ARTS.

A VERY interesting paper was recently read before the Institute of Naval Architects by Mr Yarrow, describing a series of experiments which he has lately conducted with a view to trace the causes of vibration in screw steamers. These experiments were made on a fast torpedo boat, the engines of which revolved at the rate of two hundred and forty-eight times per minute. These experiments clearly showed that the vibration, so familiar to all travellers by sea, is not due to the action of the propeller in the water, but is caused by the machinery itself, and by the want of due balancing of the various cranks, piston rods, &c. To prove this, the vessel was deprived of its propeller while held fast by cables in still water, when it was found that the vibration of the hull was communicated to the surrounding water, and the ripple commotion caused thereon was conspicuous enough to be photographed. Mr Yarrow pointed out that by the use of weights and other devices the vibration of the machinery could be greatly reduced.

For a long time the locomotives on our trunk

railway lines have been so constructed that they are able to take up water from tanks placed between the rails even while going at full speed. A method of taking up coal without stopping has been invented in the United States, and the apparatus is to be tried upon one of the main American railroads. A working model has been made, but the details of the mechanism have not yet been published.

A great deal of attention has lately been directed to the question of carrying a life-line ashore from a vessel in distress. It was recently proved on the occasion of a wreck on our southern coast that the rocket apparatus is limited in its range, and this limitation is, of course, increased when the projectile has to force its way against a strong wind. Some successful experiments have been made near New York City with a large kite, which can be folded up when not in use, and will pack into a very small space. The kite is attached to a buoy, and will quickly convey that buoy across the roughest water. By this means it is possible to carry to the shore a very much heavier line than it is feasible to carry from the shore by means of a rocket; and it will readily be seen that the strong wind which forms such an obstruction to the passage of the latter, is a great help in carrying the kite to land.

The reindeer has been introduced into Alaska by the Government Agent of Education there, Dr Sheldon Jackson. It is believed that as this useful animal flourishes so well in Siberia it will soon become acclimatised in Alaska, where the conditions of vegetation, temperature, &c., are much the same. The experiment is most important from an economic point of view, for there are few animals which are more generally useful than the reindeer. Besides being valuable for drawing sledges, it is also greatly esteemed for its meat, its milk, and also for the value of its skin.

The manufacture of an artificial india-rubber has lately been protected by patent. The component parts of this composition are manila gum, benzine, bitumen, and resin oil. It is said that the product obtained from careful admixture and special treatment of these materials gives a substance which possesses all the elasticity, solidity, and suppleness of the finest india-rubber. It can, moreover, like the valuable product which it imitates, be vulcanised in the usual way. It is probable that the new compound will be found valuable to the electrician as an insulator, but we have not heard whether it has yet been tried in that capacity.

Mr H. A. Fleuss, whose life-saving apparatus formed the subject of an article in our columns some years ago, has produced a hand ice-making machine, which was described in a paper read by him at a recent technical meeting of one of the Societies. This machine embodies the principle of the Carré ice-making machine, particulars of which can be found in all the physical text-books. But in Mr Fleuss's machine the mechanism has been simplified and much improved, so that it is possible to procure a small quantity of ice at a few minutes' notice and with very little expenditure of labour. The machine will be invaluable on small yachts and other sailing-vessels which find their way to warm

latitudes. On larger vessels, where steam is available, ice, as is well known, is readily produced by the compression and expansion of air.

From a consular Report we learn that the paper-manufacture is one of the chief industries in Corea. The paper is made in the most primitive manner from the bark of a tree which is indigenous to the country and which is closely allied to the mulberry. The bark is gathered in the spring, and is boiled for a long time in water to which wood-ashes have been added, until it is reduced to pulp. This liquid pulp is placed in vats, and flowed over bamboo screens, which may be taken to represent the wire-work moulds used for hand paper-making in our own country. The web of paper thus formed is placed on a hot floor and ironed by hand. The Corean paper serves a great many useful purposes, for beyond its common use for books and writing, it is made into hats and boxes, is used for covering walls and ceilings, and also finds its way to China and Japan for the manufacture of umbrellas.

One of the New York theatres is employing the incandescent electric lamp in a novel manner, namely, to give the effect of sunrise on the stage. The apparatus consists of a curved screen partly made of gauze, behind which are arranged a number of incandescent lamps, which are so controlled by switches that the light given by them can be made to gradually increase in power. The electric current is also used in the same theatre to give the effect of a bursting shell, the shell itself being made of paper containing just enough powder to give a flash and to destroy it, while a current is simultaneously sent to a gun behind the scenes, which makes the necessary noise for the explosion.

General readers very seldom trouble themselves about the contents of those volumes constantly issued by government authority under the name of Blue-books. A blue-book is indeed looked upon as the synonym of something very dry and uninteresting. Yet these volumes occasionally give details which are worth attention even by the ordinary reader, and particulars of important proceedings are found here which cannot be readily gleaned from any other source. As a case in point, we may turn to the blue-book containing an account of the mines and minerals raised in Britain during the past year. From this we learn that the value of the gold smelted amounted to nearly £14,000, while the silver was valued at upwards of £2000. Iron stands first among the remaining metals, for its produce, after smelting, amounted to nearly £12,000,000. This unfortunately represents a falling-off of £3,000,000 when compared with the amount smelted in the previous year. Next in order comes tin, the value of which is put at £800,000; while the lead raised amounted to £400,000, and the zinc to about half that amount. The figures we have given represent the amounts in round numbers, and they all show a decrease on previous returns, except in the case of gold.

A new kind of miner's pick has been introduced by Messrs Camm, Bagshaw, & Co., of Lead Mill Steel Works, Sheffield. The chief feature of the new tool is that it is not made in one piece like the ordinary pick, but consists essentially of a steel casting which fits upon the shaft, hollowed out at end for the reception of the points or

blades of the instrument. By a clever device these points are perfectly tight when fixed, and they can be instantly released by a small wedge, which the miner can carry in his waistcoat pocket. It is possible to make the points or blades of better steel than when the pick is all in one piece, and these points can be replaced instantaneously when worn out, at small cost. One great advantage in using this new tool is that only one pick need be taken down the pit, while the points for renewal only need to be carried about. It is said that the new pick, weighing two pounds, will do better work than the older kinds, which weigh fifty per cent. more. The cost is about the same as the old pattern pick.

A fresh terror seems to be in store for the unfortunate inmates of the Russian prisons. It is proposed that the cells should be fitted with concealed microphones, so that any conversation can be automatically conveyed by wire to a distant telephone. There is no doubt that this idea could be carried out by means of a sensitive form of microphone. When this wonderful little instrument was first produced by Professor Hughes about fifteen years ago, it was jokingly said that it would be a convenient instrument to hide in the rooms occupied by a Cabinet Council, so that state secrets might be made known to outside ears. We presume that in Russia the use of the instrument will be confined to those prisons which are devoted to the reception of political offenders.

Modern aerial navigation was the subject of a paper recently read at the Royal United Service Institution by Captain J. D. Fullerton. In this paper the question of aerial navigation was divided under two distinct categories—(1) Ballooning, or the use of machines lighter than air; and (2) aëration, or navigation by means of machines heavier than the air. In describing the qualities required in a war balloon the lecturer said that it should be capable of carrying, besides one or two passengers, a supply of explosive shells and a machine gun, and that it ought to be able to travel by mechanical means at such a rate that it would be able to keep up with any war-ship afloat. The great difficulty in ballooning, and also in the construction of any flying-machine, was to obtain a sufficiently light motor. The lecturer concluded his remarks by quoting a statement which has been attributed to Mr Maxim, who is now engaged in constructing a flying-machine on a very large scale, upon which he has already expended about £10,000. 'If I can rise from the coast of France, sail through the air across the Channel, and drop half a ton of nitro-glycerine upon an English city, I can revolutionise the world. I believe I can do it if I live long enough; if I die, some one will come after me who will be successful if I fail.'

In the recent Report of Her Majesty's Inspectors of Explosives for the past year, two samples of gun-cotton were referred to, one of which had been under water for sixteen years, while the other had been buried under ground for twenty years. Both these samples were in fine condition, and as ready for the work of destruction as they were on the day of their manufacture. This shows that gun-cotton prepared with care is one of the safest explosive agents which can be employed. The fact alone that it can be

kept in a wet condition, and can, by special appliances, be exploded while wet, but is explosive unless those particular means be adopted, is sufficient to show that it can be stored with the greatest safety.

Some wonderful results with regard to potato culture have been obtained by a gentleman-farmer in France. This farmer, who is also a distinguished chemist, has been, according to a recent Consular Report from Nantes, for some time past conducting experiments with potatoes, with the remarkable result that he has succeeded in securing the enormous return of forty-two tons per acre. The plan he adopts is to carefully select the seed and to use only the best and soundest tubers. The ground is dug or ploughed to a great depth and is well manured. Before planting the seed potatoes, they are soaked for about twenty-four hours in a mixture composed of saltpetre and sulphate of ammonia, six pounds of each salt to twenty-five gallons of water. After this soaking, the tubers are allowed to drain, and they then stand for twenty-four hours longer, in order that the germs may have time to swell.

The same Report tells us that last year's potato crop in France was, owing to the unusual dryness of the season, below the average. Whenever disease showed itself, a dressing was used, consisting of two pounds of blue vitriol and four pounds of lime to twenty-five gallons of water. For preserving potatoes during the winter, it is recommended, after picking out the diseased tubers, to store the sound ones in a dry building or cellar in a heap about three feet deep. The place should be well ventilated; but in cold weather the doors must be kept closed, and the potatoes must occasionally be stirred about.

In the course of a discussion which took place recently after the reading of a paper at the Society of Arts, Mr J. Hughes referred to the composition of Nile mud, the fertilising value of which has always been regarded as being so great. Samples of this mud he had, some years ago, had occasion to analyse, and he found two special points about it which were not generally known: one of these was that the water was remarkably soft, and the other that it contained a considerable amount of nitric acid. The mud, in fact, was a complete manure, containing all the essentials for the food of plants in a very fine form, which alone was a great advantage.

Some good practice has recently been made with the new magazine rifle, about which weapon such unsatisfactory reports were circulated a few years ago. The gun was employed experimentally at the Hythe School of Musketry, and it was fired with smokeless powder, at a body of dummy figures, at a distance of eight hundred yards. The number of hits was eighteen per cent., which speaks well for the new arm, when it is remembered that it is a well-ascertained fact that in warfare not more than one per cent. of the bullets fired do any damage whatever. In testing the new rifle against the old one fired with black gunpowder, the value of the new explosive was seen to great advantage; the smoke emitted from each rifle being only about as much as would proceed from the end of a cigar. A distinct advantage would accrue to troops under such conditions, as their place would not be readily

discernible by a distant enemy, and, therefore, practically they would remain for a long time undiscovered.

Among the most interesting things shown at the recent successful Naval Exhibition in London was the very beautiful model of Nelson's celebrated flagship, the *Victory*. This model, although full size, was not a complete representation of the old vessel, the original of which is preserved at Portsmouth Harbour: it was, indeed, but the hulk of the ship, and so far was very completely carried out. It has now been determined that this same model shall be completed by adding to it every detail of the spars and rigging of the old ship, and in this restored state it is to be exhibited at the World's Fair at Chicago.

Another vessel of far different kind is being modelled for the same Exhibition at Cadiz, under the auspices of the Spanish government. This is to be a full-sized model of Columbus's ship, the *Santa Maria*, which carried the famous explorer to the western world. A gigantic statue of Columbus is also to be shown at Chicago, and this monument will furnish a design for souvenirs of the exhibition.

Dr Colin, a French army surgeon, has been studying the effect of regular marching upon soldiers, and he asserts that the regularity of the step causes a shock to the brain and the bones, which will often break down the strongest men. This shock is repeated forty thousand times in a fair day's march, and, therefore, it is productive of far more wear and tear to the brain and body than the irregular step usually adopted in taking mere walking exercise. The use of a rubber heel for military boots is found to give partial relief.

The beds of onyx in Arizona are of such vast extent that several car-loads are shipped daily from one mine. This mine is said to represent an almost solid body of the beautiful stone, measuring one mile by a mile and a half in area. A piece of onyx, the largest ever dug, was recently removed from the mine, which measured twenty-three feet by ten feet, and twenty-six inches thick. The Arizona onyx is finer than the Mexican, and will take a very high polish. It is shipped to Chicago, New York, and other cities, where it is used for table-tops and all kinds of other ornamental purposes.

It is announced from Tunis that excavations are now being made in the famous two-headed hill mentioned by Virgil, which hill is situated about eight miles from Tunis. Many interesting remains have already been unearthed, and it is confidently hoped that better will follow. A temple of Baal Saturn, which has been almost entirely laid bare, is attracting particularly the attention of the French archaeologists, because of its peculiarly interesting statues and bas-reliefs. The building is situated at an elevation of over sixteen hundred feet; and this is another proof that the Carthaginians practised their religious ceremonies on hills. On all the statues of the gods to which the temple is dedicated the names Baal and Saturn are found together, which would seem to indicate that to flatter their Roman conquerors the Carthaginians had added to the name of their chief god that of the highest Roman deity. Unfortunately, the statues found are only

torsos. Urns and small lamps bearing Christian emblems, and small coins of the third and fourth centuries, have been found. The excavations will be continued under the direction of the French archaeologist, Monsieur Toutain.

A WINTER'S TALE.

WE were watering the oxen at the well—Douglas and I—smoking and talking as we watched the cattle drinking and sniffing between each bucketful with a lazy satisfaction peculiar to their kind, and then carefully knocking over the pails with their noses after every drink. When I reflect on the number of pails Brandy and Soda broke in a year by these and other means, it is a wonder to me now that we made out as well as we did at first with our farming operations.

Douglas was a Scotch Canadian, up from the Portage on a visit to some friends, but an old-timer who knew the North-western prairies from Winnipeg to the Rockies, and from Prince Albert to the Moose Mountains, as well as the Red Men themselves.

We were sorry to hear from him that the Indians had prophesied an open winter, for we knew that they seldom blundered as to weather. Open winters, he continued, were a nuisance and hard on axles, for they meant severe frosts and little snow, with frequent heavy thaws—a state of affairs that would not admit of running sleighs successfully, and knocked wagons to splinters. Still the Indians had foretold it, and—at that time—I agreed with him that it was hopeless *our* trying to learn anything that *they* did not know about the weather; about hunting, fishing, and trapping; the operations of nature; the habits of bird, beast, and fish, and such-like occult arts and sciences.

But when spring came and the clang of the geese echoed on river, lake, and slough (Canadian pronunciation 'Sleugh'), and the long-drawn caw of the crow as he loafed across country resounded down the valley; and the young poplars and the willows, the saskatoon and all wild fruit-trees seemed to vie with one another in the race of growth, I began to wonder to myself what a hard winter was like, if the last six months represented an open one.

About the middle of October 1887 the 'Colonel' and I left our temporary winter-quarters a short distance from Castle Avery, to go down with the oxen and wagon to Birtle to enter for our land, and lay in stores and clothing for the winter. We started one day after dinner, travelling the twelve miles to Shellmouth before supper, and staying there till morning, covered the fifty miles thence to our destination in the course of the next two days.

We entered for our homesteads, and having attended to other necessary business, made all haste to get back, for the weather was wild and threatening, and the hard state of the trails and frequent snow-showers made our mode of progression unpleasant in the extreme; though on other matters we had no anxiety, as we had left everything at the ranch in care of our good friend Leslie.

We did well to hasten, for on the night of the 22d there was a heavy snowstorm, and the

mercury suddenly fell to fifteen below zero. The next day, Will Jameson, Jim Burt, and I broke the ice at the North Crossing of the Assiniboine, and made our way over the river in the boat, because we were afraid that the comparatively thin crust of ice would not bear us. I remember the occasion well, for Jameson and I stood on the south bank for about twenty minutes, shouting in the teeth of a bitter wind, to attract the attention of Burt's folks on the other side; and had not Burt come out by chance, we might have been standing there yet, for all the good our shouting did. After spending another quarter of an hour breaking the ice, Burt finally succeeded in getting across and taking us aboard the old second-hand and leaky egg-box that did duty for a boat; but there was so much water in it that I quite spoiled a brand-new pair of Indian moccasins I was wearing for the first time.

I don't think I shall ever forget Burt's crossing of the Assiniboine. I was telling him only the other day I intended making it figure in the first story I tried to write; and here it is. I have never yet crossed at this spot, owing to the wretched means of transit, without getting wet. As a general rule, of the two making the passage in the boat the passenger has to bale for dear life; and the ferryman for the time being has to pull like a Trojan to get across without egg-box and all going under; and when the river is high and running like a mill-race, it would be almost exciting if it were not so confoundingly damp. Well, the ice is getting pretty thin now, being early spring, and last night when I was taking Jimmy's mail to him, I suddenly landed up to my waist in a hole against the north bank, where the sun strikes at noonday. Luckily, the house is not more than two hundred yards away: so I soon obtained a change of clothing, and, not altogether relishing the idea of another bath in ice-cold water and after dark, I stayed at Burt's all night; but before I go over there again I shall insure my life. But this is all by the way—I must get back to my 'Winter's Tale.' A few days after our crossing in the boat, the ice was strong enough to bear a team, and remained in a state of rock-like solidity till the middle of April 1888, when the Martins, on the way back to their homesteads in the West, after wintering in the valley, found it strong enough to sustain the weight of the fifty head of cattle they took with them. It was indeed a long and weary winter.

Snow fell pretty often during November and December, and on and off in that time the Colonel and I were busy getting home the cattle and 'fixing-up' our houses and stables.

Before Christmas we registered fifty-seven degrees of frost; but on one occasion the wind blew from the west with a warmth that strongly resembled the Chinook (the name applied to the westerly wind that frequently springs up in that section of the North-west that lies near the Rocky Mountains, where it has its origin, and has the peculiar effect of raising the temperature from often below zero to above freezing-point in a few hours, melting the snow, and inducing an almost spring-like warmth), that so often prevails at this season of the year nearer the Rocky Mountains. On Christmas Eve and Christmas Day the snowfall was incessant; and then the fierce

Manitoba winter shut down with a snap, and for nearly four months blizzards, forty below zero, and snowstorms, followed one another with a regularity and pertinacity that became monotonous; while up to the end of May we did not experience more than three weeks of pleasant weather.

Christmas Day was the jolliest I had spent in the country since I left home. The Colonel's plum-pudding was a triumph of culinary art; while my beef-steak pie was as dismal a failure. I shall always believe it was his fault for leaving the oven door open while I went up to the post-office for our letters.

Leslie and Bickford came up to help us to eat the good things—at least the roast pork and pudding, for I had to devour every scrap of that steak pie myself. I had made enough for four men with appetites in proportion to the time of year; so I was quite a while performing the feat, and the number of times that pie appeared on the scene during the rest of the winter was wearisome in the extreme. The only drawback to the glory of the feast was the want of flavouring with the pudding—that kind of flavouring that goes very well with a pudding, and is not wholly unappreciated without.

After dinner or supper—it came off at five p.m.—we had a little music and singing, *Nancy Lee*, and the like, accompanied by Leslie's concertina. About half-past ten Bickford decided to go home, in spite of our urging him to stay till morning; and the last I saw of him that night was being pitched out of the saddle over blind Poll's head; but the snow was so deep that he sustained no damage. In some respects, indeed, it was rather an elevating end to a pleasant evening, but I myself prefer alighting from the saddle in a more deliberate and less energetic manner.

Two or three days after Christmas, I was helping Leslie to thresh; but what with ice and barley beards, my spectacles became so misty that about all I could see was the way to the house, whither I retired and thawed the glasses out. It was wonderful the number of times I had to do this in the course of the day.

During the rest of that week I helped the Colonel to get in supplies of wood and hay; and on the last day of the year went down to Shellmouth with the Castle Avery mail. The trails were bad; but with a good hand at the reins the ponies had to get there, and in spite of the drifts we hardly broke the trot the whole twelve miles. Arrived at Shellmouth, I met the 'Skipper,' and together we went out to his place (Trincomalee), where I stayed ten days; but as there was not employment for more than one, I was not overworked, and in fact grew restless for want of something to do, and longed to be out of doors to do it. But the time was near at hand when I was only too glad to remain in the house. On the 10th of January the Skipper drove me home, and never shall I forget that drive.

The thermometer registered twenty-five below zero when we started at noon, with a biting north-westerly wind; but the day was fairly bright and clear. We went a mile and a half out of the way to pick up Blanc, and then pulled out for Castle Avery and home; and though we were behind as good a team as there was at the time in this section of the country, it took us nearly five hours to travel the thirteen miles.

Nor were we exactly prepared for what was in store, for with the exception of some straw at the bottom of the wagon-box, which was mounted on sleighs, the horse-blankets, and Blanc's ox-hide, we had no suitable covering to protect us from such intense cold. As it was, the trail was hardly ever visible between Blanc's Bluff and Castle Avery. For a few minutes the horses would find it below the drift; the next instant, in their endeavour to follow it, they would mount miniature walls of snow, caked hard enough to bear the weight of the 'whole outfit' for a few yards successfully; suddenly, the treacherous crust would crack, and, slipping and plunging, now on the trail and now off, with one runner cutting nearly to the ground, and we ourselves in danger of being pitched out over the side, they toiled painfully and gallantly forward, the Skipper giving them their heads and constantly cheering them to further efforts—and they responded to the call. All the time, the wind, as if delighting in our helplessness, swept down and smote us with an icy keenness that made us curl up and shiver and chilled us to the marrow.

Once clear of Hamilton's Lake, the worst was over; and as we neared Castle Avery and the more wooded country, the edge was somewhat taken off the blast, and we felt cheered at the prospect of getting through in safety. But our destination was two miles beyond the Castle, and though we were sure of a kindly welcome and thaw-out within its hospitable walls, we, as we passed, merely dropped Blanc, who was bound thither, and never drew rein till we reached home. Fortunately, none of us were frozen, but stiff and weary from the exposure, the Skipper and I were able to eat but a morsel of supper. After seeing that his team and the cattle were comfortable for the night and taking a few whiffs, we turned in under all the blankets we could find, and awoke none the worse next morning for all we had gone through.

During the night the wind shifted to the opposite quarter, and when I bade the Skipper and the Colonel—whose turn it was now to go visiting—good-bye, there was a raging snow-storm from the south-east, that increased in intensity and vigour all day, continuing till about midnight, when the snow ceased, and the wind veered round again to the north-west, ushering in the direful blizzard of Thursday, January 12, 1888, disastrous alike to the lives of man and beast from the Mackenzie to Southern Iowa, while it was felt, more or less, right down to the Gulf of Mexico.

And yet the tale of frozen human corpses to be found during the next few days in this little understood and much abused province of the Great Lone Land might have been counted on one's fingers—a fact which will compare favourably with the havoc and distress wrought by the same tempest in the United States.

While it lasted, the maximum temperature for forty-eight hours was twenty-eight below zero, and the minimum at night-time forty-two below. The cattle and I kept warm and snug; but on the first day the pipe of the heating-stove in my bedroom was burned out and rendered useless; and for ten days I was obliged to live in the kitchen, where for a time I was a little crowded,

since Bickford, who lived only half a mile away on the river-bank, found his shanty too cold to remain in, and therefore came and stayed with me, bringing a friend or two with him. Indeed, the most serious matter was the hay running short. I did get a small 'jag' on the Friday from Bickford's nearest stack, and on my way back 'dumped' it, sleighs and all, in a gully near the house. But with the help of ropes and logging-chains, and a good steady pull, and no jerking, from Brandy and Soda, I succeeded in righting and getting the load home with no worse result than a frozen nose for myself. But alas! for the next two nights I had so many four-footed visitors as well, in the shape of a neighbour's horses I was temporarily accommodating, that soon there was but little of the jag left. However, Sunday falling quite calm, enabled me to fetch a good load, and from that time till the end of winter the supply of hay was well maintained.

The blizzard fairly over, we entered upon a short spell of steady cold, but delightfully fine and crisp weather, such as, I believe, is only to be found in these latitudes. From the instant when the night began to wane before the softly stealing dawn, when the first light touch that told of the nearing of the sun rifted out over the land in gleams of faintly roseate hue, all through the short day till the last of the afterglow, reflected in the eastern sky, slowly died away, the hours were full of sunshine and brightness, unflecked by cloud and unruddled by the slightest breeze. And the daylight had scarce left us, ere, night after night, the Northern Lights, like giant torches pointing the path to heaven, flashed forth and glinted weirdly, with a radiance that rivalled the glory of the winter's moon, till wooded crest and fertile valley, ice-chained river and glistening lake, homestead and hamlet, were illumined with a more than earthly splendour; and the wolves, as if angered by the flaming brilliancy, howled in dismal and tuneless chorus.

But all too soon we were to experience another series of snowstorms and heavy winds, that lasted till well on to the end of February, though, of course, the temperature became warmer and outdoor work less irksome. But as I continued to 'run the show' single-handed till the Colonel's return, I performed only the most necessary duties, such as tending the cattle, keeping up the stock of wood and fodder—as a substitute for water we melted snow, and the beasts went down every day to the water-hole cut in the river ice—and those odd jobs that always crop up on a Manitoba farm, as elsewhere.

Still I was far from feeling lonesome. Our shanty was on the trail to the lumber camp forty miles north, to the various hayricks in the valley, and to the bush for cutting both logs and firewood, so that friends used constantly to give me a call on their way past with their teams, sometimes remaining long enough to warm and have their meals with me, or perchance staying all night.

When the worst of the weather was over, the Colonel returned, and was shortly followed by Boffin and Rumbles, who, coming up from the timberless country some miles to the south of Castle Avery, elected to live with us while cutting a set of stable logs. We were a jolly party.

Besides the Colonel—whom I was glad to welcome back—and our two friends, there was Leslie, who came over day by day to hew the logs as they were cut, and a pretty regular stream of the wayfarers before mentioned. So that when the day's work was done, the dishes washed, and the cattle fixed up for the night, we had plenty of fun before we turned in. We went to bed early, for the work was more trying than even in mid-winter. The very warmth of the days caused us to get wet through from the knees downward in the melting snow, and this was followed by a sudden chill that came as soon as the sun began to sink, with the result that our trousers and felt boots were frozen as stiff as boards, which made us glad enough to come in to supper and the welcome warmth of the stove.

With the departure of Rumbles and Boffin after a fortnight's visit, and the completion of our own work in the bush, the Colonel and I began throwing down Benson's house, which we had bought, preparatory to hauling the logs it was built of to our homesteads, only leaving the work to help our neighbours with their house-raising, which came off as soon as the softened state of the snow permitted of turning up the earth sufficiently to lay the corner stones. These house-raising frequently gave us heavy, but by no means unpleasant work, when we all pitched in with a will—contented in the knowledge that we were helping our friends, and could count on their assistance at some future time for any like work that we might wish to undertake for ourselves.

We attended the first of these bees about the middle of April. Bickford was putting up a new stable, and I remember what a task it was to lift the heavy twenty-five feet ridge-pole into its place.

It was very warm in the sun, though the snow was still quite deep, with hard frosts at night, and we were looking forward to the advent of spring, for though on April 5th we experienced a fearful snowstorm, during the continuance of which I had to dig away the drifts from the stable doors three times, the geese had returned on the 7th, and their welcome cry was a sure forerunner of that grand summer weather which came at last, though slowly and reluctantly.

M O R N I N G.

THE tide of human life ebbs to and fro,

For night and sleep's forgetfulness are past,

And toiling men awake to come and go,

Upon the turmoil of a city cast.

Afar from ways that breathe of sordid care,

Of aching hearts, and many a life forlorn

In weary want, I turn my sleepless eyes

To where the maiden Morning's smiles are fair,

By rippling streams beneath unsullied skies,

Where winds come murmuring through the balmy air

With sound of angels' wings in Paradise;

And still beyond, where blossoms have no thorn,

And souls no striving; shades of grief and woe

Lost in the glory of Eternal Morn.

SATURDAY, AUGUST 6, 1892.

PRICE 1½d.

A GLIMPSE OF CYPRUS.

'Six o'clock, sir; just rounding Cape Gatta; Limasol in sight;' so said the steward, rousing me out on a fine shining morning to have my first peep at Cyprus.

In five minutes I was on deck, glass in hand, eagerly examining the shore. In the foreground was Cape Gatta, a bold headland, running far out into the waters of the blue Mediterranean; next, the salt marshes, so little above the sea as to be hardly distinguishable from it; farther round the bend of the bay, a few white dots; two or three minarets pointing their slender black tops to the sky; some firs, olives, and one or two straight palms, marking the position of Limasol; while far in the background, shimmering in the heat, rise the blue masses of Mount Troödos and its attendant hills, towering towards the clouds. Behind and on each side of the town the country looks brown and yellow; undulating, thickly dotted, especially near the sea, with small trees, and continually rising in height; broken and cut up in all directions by precipices and ravines, till at length it gradually merges into the blue hills in the far distance.

No sooner had the anchor been dropped than the ship was surrounded by boats with fruit for sale. Enormous bunches of purple grapes made our mouths water; but nothing could be done till the arrival of that most important official, the Health officer. At last we got *pratique*; then came the struggle to buy fruit, get breakfast, and rush on shore. Just inside the ship were lying a good many small Mediterranean craft, two of which were sponge-fishers, with very queer rigs, ornamented by strings of sponges hanging up to dry. Landing on a good pier, which has been built since the occupation, we managed to get a guide, and starting up the main street, soon found ourselves surrounded by a varied crowd of all nationalities—Greeks, Italians, Arabs, Cypriots, Nubians, and Turks, all seemed to have representatives here. The streets are for the most part paved with slabs of stone, but are

very dirty and narrow in parts. In the main street, at the back of the new custom-house, there was a kind of market going on. The pavement was lined on the shady side by women selling silks, neckerchiefs, and cotton stuffs made in Cyprus. Some of these materials were really very pretty; one, in particular, was a silk and cotton stripe, costing there about eightpence per yard; but sold at very much higher prices in London, by firms who buy up large quantities that are made in Nicosia, the capital of the island. There were also bright red, yellow, and purple handkerchiefs, roughly printed with designs round the edges that seemed to please the natives. Right under the wall was a man selling by weight some kind of pastry, simply floating in syrup—the weights used being simply bits of stone, supposed to be one oak—equal to two and three-quarter pounds English. We heard that a law had lately been passed, and was gradually coming into use, making the employment of proper weights compulsory. In one of the sweet-shops where we bought *Rahatlikom* (Turkish Delight), the weights were simply pieces of iron with bits of wire and stone tied on.

The dress of the peasant men consists of a Turkish fez bound with a turban, loose, very often striped red and white; blouse tucked inside a coloured cumberbund; and very baggy trousers, sometimes of a fine peacock blue colour; finishing up with thick half-knee boots. The women had much the same dress, with the addition of a petticoat or two. This kind of dress was worn chiefly by the country-people, the town-people being partly dressed in European costumes.

The queerest things of all in the dress were the half-knee boots. These were worn almost exclusively by every peasant, man and woman, in the place. Made of rough thick leather, all in creases, worn quite brown on the edges, the boots appeared as though they had not been cleaned or oiled for years. The soles were about one inch thick, studded all round with enormous iron nails, which are beaten up on the side of the sole so as to form a sort of side-plate. The reasons

for wearing such enormous footgear are twofold—firstly, as a protection from the snakes, which abound during harvest-time; and secondly, to keep the sand from their feet as much as possible. The 'yarn' is, that the boots are seldom taken off, people even sleeping in them.

After walking the streets for some time, we went to see the Greek church. This was a very barn-like building in a courtyard, with a high wall and gate next the street, so that no one could find it unaided. In front of the door of the church were a few marble slabs in memory of Greek priests; and on the interior walls were a few frescoes, very badly drawn and coloured. The chancel was divided from the church by a splendid carved wooden reredos, with panels gilt and painted with figures of saints, giving a very rich effect to the whole church. One of the priests came in, dressed in his robes, a high black circular hat, with the top edge turned outwards, and a long black cassock. As he could not speak a word of English, and we as little Greek, there was not much conversation; but we admired his altar, and remembering the Greek word for 'beautiful,' parted with beaming smiles.

There is a very nice club in Limasol, kept up for the benefit of the army and some civilians. The rooms seemed very cool after our morning's tramp in the hot sun, and a long drink of wine and soda was most inviting. The wine was very like good Sicilian claret, rather more fruity and dry, but not doctored with potato spirit, as much of that is. This wine is brought into the town in sheep-skins with the legs tied up, and the liquid poured out through the neck. In one of the streets we saw a courtyard full of wine-skins, some full, some empty, all lying about on the ground, stained blood-red with wine, and looking exactly as though it was a slaughter-house.

On Mount Troödos, about thirty-five miles from Limasol, is the summer camp of our troops. This is a very pretty spot, surrounded by trees, and about six thousand feet above sea-level, making it quite cool, so much so, that, in the camp, soldiers were sleeping with four blankets, and then hardly warm, when people down at Limasol were gasping and trying hard to keep cool. The road to the camp is in many places very rough, often running along the side of precipices, where one false step would mean death; so that, although only thirty-five miles, the ride often takes six hours, or, by using a change of ponies, four hours. The ambulance bringing down women and children takes some fourteen hours to do the same distance; but then of course they do not move beyond a walk. There are two more camps used in the winter—one at Polymedia, about three miles from Limasol; and the other at Perapedia, at the foot of Mount Troödos.

There used to be plenty of shooting when the occupation first took place; but since the English have shown the natives that birds can be hit on the wing, every man who can manage it gets a gun and goes shooting every thing that flies, except snipe, as they cannot manage to hit these yet. The consequence is that if you want shooting now you must work hard, and be thankful for what you can get.

The majority of the houses in Limasol are built of sun-dried bricks, made from mud mixed with

seaweed, and built together with mud for mortar. The door-openings have often stone angles and arches, the doors themselves being made in two leaves, studded with large nails, and with a carved post in the centre. Small images are often fixed in the sides of the doorway.

The blacksmiths use a peculiar kind of bellows for their forges, made in two parts, with handles at the end of each, and worked by a man sitting in the centre and alternately pushing each part. These seemed to give an almost continuous blast with little trouble.

In one house was a man carding wool in quite a novel way. Squatting on the floor, he held in front of him a bamboo bow about six feet long, strung with thick catgut. This gut he kept on pulling out just sufficiently to touch a heap of rough wool, a small quantity of which was torn out and thrown on a heap of fine carded wool by the rebound, the jerk being sufficient to card it beautifully. Shoemakers and mule-saddlers were greatly in the majority amongst the trades, dozens of them everywhere. Well-made baskets of white bamboo are of native manufacture and very cheap.

On our way to the landing-place we passed a gang of prisoners guarded by 'zaptiehs,' uniformed in white, with a red fez, and armed with rifles and bayonets. The prisoners were dressed in light blue, not unlike our own convicts. On turning the corner we saw the prison, originally an old castle, looking very solid and strong, with high stone walls, and embrasures on top. We decided that it would be interesting to see the inside; but how? was the question, as an order was wanted, and we had none. We will try, was the decision; and going up a short flight of steps, we came to a small heavily-barred and studded door, at which, by luck, a native had just knocked and was now waiting to go in. As soon as it was opened, we walked in, waiving the jailer to one side, as though we had a dozen orders, went right round the prison, followed all the time by the jailer, saw all the prisoners on the ground-floor, and were starting to come out again, when cries of 'order' were hurled from a top gallery on the head of our poor jailer, making him try to tell us, by gestures, that we must clear out if we had no order; so out we went.

The prison was one large vaulted hall, with a gallery half-way up, and cells on the ground-floor and gallery. These were simply vaulted holes with an open barred grating in front, and from one to three men in each, with their names and sentences on a board hanging outside. The furniture was simply one or two wooden table-beds and a rough blanket, but everything very clean.

Our time was getting short; so back to the boats was the order, passing on the way through some of the busiest streets of the town, full of small shops and traders—here a Soudanese, black and shining as a well-polished boot; there a Cypriot sitting cross-legged on a board; farther on, rows of tinnmen, all finding the greater amount of their material in paraffin tins; mule-saddlers, boot-shops, and all the one-hundred-and-one small trades that exist in an Eastern town.

Oh those paraffin tins! what would the East-erns do without them? Pots, kettles, ovens,

boxes, lamps, flower-pots, and a dozen other things besides, are all made from them. A short time after leaving Cyprus, I saw some standards captured from the Mahdi at the battle of Toski; even these had pointed tops to their staffs made from paraffin tins, and bearing the stamp, 'Safe from fire.' Rather a parody on the adventures of the wretched flag.

Now back on board again, very glad to get a good wash and change, to free ourselves from some of the Cyprus sand. Then sitting on the deck and watching Cyprus fade away into the dim blue distance, we felt that at least we had not wasted our time.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXX.—ATHELSTAN'S DISCOVERY.

ON the evening of that same day the same discovery was made by another of the persons chiefly concerned.

You have seen that Athelstan on his return made haste to find out the commissionaire who had presented the forged cheque. Happily, the man remembered not only the circumstance itself but also his employer on that occasion. A generosity far above what is commonly found among those who employ the services of that corps endeared and preserved the memory of the day. He had received, in fact, half a sovereign for an eighteenpenny job: and the commissionaire is not like the cabby, to whom such wind-falls are common. Not at all. With the former we observe the letter of the law.

After eight years this man's memory was rewarded. This thrice blessed job produced yet more golden fruit. Heard one ever of a more prolific job?

After breakfast, Athelstan was informed that a commissionaire desired to speak with him. It was his one-armed friend.

'Beg your pardon, sir,' he said, saluting after the military manner—'you said I was to come and tell you, first thing, if I found your man for you.'

'Certainly. I told you also that I would give you a five-pound reward for finding my man, as you call him. Well—I will be as good as my word if you have found him.'

'I saw him yesterday. The very same old gentleman that sent me to the Bank that day. He's older, and he doesn't look so jolly, and he walks slower; but I knew him at once.'

'Oh! are you quite sure? Because a resemblance, you know?'

'Well, sir, I can swear to him. I remember him as well as I remember anybody. He sat in the chair, and he laughed, and he said: "You've been quick over the job, my man. There's something extra, because you might have dropped the money down a grating, or run away with it, or something," he says. "Here's half a sovereign for you, my man," says he; "and I daresay you can do with it." "I can so, sir," I says, "and with as many more like them as I can pick up."

Then he laughed, and I laughed, and we both laughed.—And that's the same man that I saw yesterday evening.'

'Oh! this is very curious. Are you quite sure?'

'I'd swear to him anywhere. A man can't say fairer.'

'No—as you say—a man can hardly say fairer, can he? Now, then, when did you see him?'

'It was between six and seven. I'd been doing a message for a gentleman in the Strand—a gentleman in the dining-room line to a gentleman in Holborn in the sausage and tripe line, and I was going back with a letter, and going through Lincoln's Inn for a short cut. Just as I was getting near the gate to the Fields, I saw coming out of the door at No. 12 the very man you want to find. I wasn't thinking about him, not a bit—I was thinking of nothing at all, when he come out of the door and walked down the steps. Then I knew him. Lord! I knew him at once. "You're the man," I says to myself, "as give me the half-sov. instead of eighteenpence." Well, I stood at the corner and waited to see if he would remember me. Not a bit of it. He stared at me hard, but he never recollected me a bit—I could see that. Why should he? Nobody remembers the servant any more than they remember the private in the ranks. The very same old gentleman; but he's grown older, and he didn't look jolly any more. 'Praps he's lost his money.'

'Come out of No. 12, did he? Why, Dering & Son's office is there. What does this mean?'

'I thought I'd like to find out something more about him; and I thought that a five-pound note was better worth looking after than eighteenpence—so I let the letter from the tripe and sausage man lay a bit, and I followed my old gentleman at a good distance.'

'Oh! you followed him. Very good. Did you find out where he lived? I can tell you that. He went to No. 22 South Square, Gray's Inn.'

'No; he didn't, sir.—But you are not very far wrong. He went through Great Turnstile; then he crossed Holborn and turned into Featherstone Buildings, which is all lodging-houses. But he doesn't live there. He walked through the Buildings, and so into Bedford Row, and he stopped at a house there'—

'What! In Bedford Row?'

'Yes; in Bedford Row—and he pulls out a latch-key and lets himself in. That's where he lives. No. 49 Bedford Row, on the west side, very near the bottom. He lives in Bedford Row.—Well, sir, I like to do things proper, and so, to make the job complete, I went to the *Salutation*, Holborn, where they keep a Directory, and I looked out his name. The gentleman that lives at No. 49 Bedford Row is named Edward Dering—and among the names of No. 12 New Square, Lincoln's Inn, is the name of Dering & Son.—So, sir, I don't think it is too much to say that your man is Mr Dering, who belongs both to Bedford Row and Lincoln's Inn. He's the man who sent me to the Bank eight years ago.'

Athelstan stared at him. 'He the man?' he cried. 'You are talking impossibilities. He can't be the man.'

* Copyright 1892 in the United States of America by Harper & Brothers.

'Nobody else, sir. If that was Mr Dering that I saw yesterday walking home from New Square to Bedford Row—he's the man who sent me for the money.'

To this statement the man stuck firm. Nor could he be moved by any assertion that his position was impossible. 'For, my friend,' said Athelstan, 'the man who sent you with the cheque was the man who robbed Mr Dering.'

'Can't help that, sir. If the gentleman I saw yesterday walking from Lincoln's Inn to Bedford Row was Mr Dering—then he robbed himself.'

'That's foolishness. Oh! there must be some explanation. Look here! Mr Edward Dering leaves his office every evening between six and seven. I will be in New Square on the west side this evening at six. You be there, as well. Try not to seem as if you were watching for anybody. Stand about at your ease.'

'I'll make it sentry-go, sir,' said the old soldier. 'I'll walk up and down in front of the door same as some of our chaps got to do in front of shops. You trust me, sir, and I won't take no notice of you.'

This little plot, in fact, was faithfully carried out. At six o'clock Athelstan began to walk up and down outside the gate which opens upon Lincoln's Inn Fields—the commissionaire at the same time was doing sentry-go in front of No. 12 in New Square. When the clock struck six there was a rush and a tramp of hurrying feet: these were the clerks set free for the day. There are not many solicitors' offices in New Square, and these once gone, the place becomes perfectly quiet. At half-past six there was the footfall as of one man on the stairs, and he descended slowly. He came out of the door presently, an old bent figure with white hair and shrivelled face. Paying no heed to the sentry, he walked away with feeble step in the direction of Chancery Lane. Checkley this was, on his way to look after his tenants and his property.

Athelstan looked after him, through the gate. Then he called his old soldier. 'See that man?' he asked. 'That's the man who sent you to the Bank.'

'No—he isn't.' The man was stout on that point. 'Not a bit like him. That old man's a servant, not a gentleman. See the way he holds his hands. Never a gentleman yet carried his hands that way. You can always tell 'em by their hands. The other day I met an old pal—seemed to forget me, he did. Wanted to make out that he'd never been in the army at all. So I lay by for a bit. Then I gets up—and he gets up too. "Tention," says I, and he stood to 'tention like a good old Tommy Atkins. You watch their hands whatever they say. Always tell 'em by their hands. That old man he's a servant. He isn't a gentleman. He can't sit among the swells and order about the waiters. He hasn't learned that way. He'd get up himself, if you asked him, and put the napkin under his arm and bring you a glass of sherry wine. He's not my man. You wait a bit.'

At a quarter to seven another footstep was heard echoing up and down the empty building. Then an old man, erect, thin, tightly buttoned, wearing neat gloves and carrying an umbrella, came out of the door. His face was hard, even austere. His walk was firm. The Sentry, as this person

walked out of the gate, followed at a distance. When he was beside Athelstan, he whispered: 'That's the man. I'd swear to him anywhere. That's the man that sent me to the Bank.'

Athelstan heard in unbounded astonishment. That the man? Why—it was Mr Dering himself!

'Let us follow him,' he whispered. 'Not together. On opposite sides of the road. Good Heavens! this is most wonderful. Do not lose sight of him.'

To follow him was perfectly easy, because Mr Dering turned neither to the right nor to the left, but marched straight on through Great Turnstile, across Holborn, through Featherstone Buildings, and into Bedford Row. At No. 49, his own house. Where else should he stop?

Athelstan took out his purse and gave the man the five pounds. 'I don't know what it means,' he said. 'I can't understand a word. But I suppose you have told me the truth. I don't know why you should make up a lie'—

'It's Gauspel Truth,' said the man.

'And therefore again—I don't understand it. Well—I've got your name and your number. If I want you again I will send for you.'

The man saluted and walked away. Half a sovereign for an eighteenpenny job, and eight years afterwards five pounds on account of the same job. Robbery, was it? Robbery—and the old man pretending to rob himself. Now what did that mean? Laying it on to some poor harmless innocent cove, the soldier guessed: laying it on to some one as he had a spite against—the old villain—very likely this young governor—most likely—Donations on account of that same job, very likely—the old villain!

As for Athelstan, he returned to Lincoln's Inn Fields, where, the evening being fine and the sun warm and the place quiet except for the children at play, he walked up and down the east or sunny side for half an hour turning the thing over in his mind.

For, you see, if Mr Dering went through the form of robbing himself and finding out the robbery and coldly suffering the blame to fall upon himself—then Mr Dering must be one of the most phenomenally wicked of living men. Or, if Mr Dering robbed himself, and did not know it—then Mr Dering must be mad.

Again, if such a thing could be done on a small scale, it might be done on a larger scale with the same result—namely, suspicion to fall upon a blameless person; obloquy to gather round his name—for in some cases simply to be charged is almost as fatal as to be convicted: and perfect impunity for himself. 'This is not my own writing, but a forgery,' said the man who had been robbed. Then, who is the forger? You—you. None but you. The bare suspicion becomes a certainty in the minds of those who were once that man's friends.—And his life is cankered at the outset. He thought of his own life; the bitterness of alienation and exile. Never any time for eight years when he could explain the reasons of his exile. Debt, the cultivation of wild oats, failure to pass examinations—anything would do for such a reason except suspicion of forgery. Athelstan was a cheerful young man. He seldom allowed himself to be cast down by the blows of fate. Nevertheless, during his whole time of exile, the drop of bitter-

ness that poisoned his cup was that he could not tell the whole story because the world would believe no more than half—that half, namely, which contained the accusation. When one walks about thinking, there comes a time when it seems no good to think any longer. The mind can only get a certain amount out of a case at one sitting. That amount absorbed, the best thing is to go on to something else. Athelstan went on to dinner. He left his sister to the care of her young man, and dined by himself. He took a steak at a Holborn restaurant with an evening paper, which he considered professionally. After dinner he returned to his subject. Perhaps he should get a step farther. No—perhaps on account of the sweet influence of dinner he got no farther at all. Here was an astonishing fact. How to account for it? You have seen—by one of two ways—malignity unspeakable: or madness—madness of a very curious kind—the madness of a man whose calm cold judgment had made him appear to his friends as one with an intellect far above any ordinary weaknesses of humanity. Mr Dering mad? Then the Chancellor of the Exchequer, the Speaker of the House of Commons, the President of the Royal Society, the President of the Institute of Civil Engineers, the Cambridge Professors of Mathematics—all these men might be mad as well. And nobody to know it or to suspect it. Mr Dering mad! and yet, if not, what was he?

There was one way. He had tried it already once. He left the restaurant and turned eastwards. He was going to try South Square, Gray's Inn, again. Perhaps Mr Edmund Gray would be in his rooms.

He was not. The door was shut. But the opposite door stood open, that of Freddy Carstone. Athelstan knocked, and was admitted with eloquence almost tumultuous.

'Just in time,' said the coach. 'I've got a new brand of whisky, straight from Glasgow. You shall sample it. Have you had dinner yet? So have I. Sit down. Let us talk and smoke tobacco and drink whisky and soda.'

'I will do the talking and the tobacco at any rate.'

'I love Virtue,' said Freddy. 'She is a lovely goddess—for if Virtue feeble were, Heaven itself would stoop to her. She has only one fault. There is reproach in her voice, reproach in her eye, and reproach in her attitude. She is an uncomfortable goddess. Fortunately, she dwells not in this venerable foundation. Do not imitate Virtue, old boy. Let me—That's right. We shall then start fair upon the primrose path—the broad and flowery way—though I may get farther down than you. Athelstan the Wanderer—Melnoth the Wanderer—Childe Harold the Pilgrim—drink and be human.' He set the example. 'Good whisky—very good whisky. Athelstan, there's a poor devil up-stairs, starving for the most part—let's have him down. It's a charity.' He ran up-stairs, and immediately returned with the decayed Advocate, who looked less hungry than usual, and a shade less shabby—you have seen how he borrowed of Mr Edmund Gray through Elsie.

'Now,' said the host, 'I call this comfortable: a warm August evening: the window open: a

suspicion of fresh air from the gardens: soda and whisky: and two men for talk. Most evenings one has to sit alone. Then there's a temptation to—to close the evening too quickly.'

'Freddy, I want to hear more about your neighbour. You told me something, if you remember, a week or two ago.'

'Very odd thing. Old Checkley at the *Salutation* is always pestering about Mr Edmund Gray. What has he to do with Mr Edmund Gray? Wanted me to answer his questions.'

'And me,' said Mr Langhorne. 'I did answer them.'

'Well—Mr Edmund Gray is—What is he? An old gentleman, of cheerful aspect, who is apparently a Socialist. We must all be allowed our little weaknesses. All I ask for is'—He reached his hand for the whisky. 'This old gentleman carries his hobbies so far as to believe in them seriously. I've talked to him about them.'

'I have heard him lecture at Camden Town,' said the Barrister. 'I go there sometimes on Sunday evening. They have a tea-feast with ham and cake and toast. It is a pleasant gathering. It reminds one of the Early Church.'

'Well, Athelstan, what else can I tell you? Hark!' There was a step heard ascending the stairs. 'I believe that is the old man himself. If it is, you shall see him. I will bring him in.'

He went out to meet the unknown footstep on the landing. He greeted the owner of that footstep: he stopped him: he persuaded him to step into the opposite room. 'You must be lonely, Mr Gray, sitting by yourself. Come in and have an hour's talk. Come in. This way. The room is rather dark. Here is Mr Langhorne, your overhead neighbour, whom you know; and here is Mr Athelstan Arundel, whom you don't know. Those who do know him like him, except for his Virtue, which is ostentatious in one so young.'

It was now nearly nine o'clock. The lamp was not lit, and the room lay in twilight. It is the favourite shade for ghosts. A ghost stood before Athelstan, and shook hands with him—the ghost of Mr Dering.

'I am happy,' the ghost held out his hand, 'to make your acquaintance, Mr Arundel. An old man, like myself, makes acquaintances, but not friends. His time for new friendships is gone. Still, the world may be full of pleasant acquaintances.'

He sat down, taking a chair in the window: the shade of the curtain fell upon his face so that nothing could be seen but a white circle.

'Let us have candles, Freddy,' said Athelstan.

'By all means.' Freddy lit a lamp on the table and two candles on the mantel-shelf. By their light the lineaments and figure of the ghost came out more distinctly. Athelstan gazed on it with bewilderment: his head went round: he closed his eyes: he tried to pull himself together.

He sat up: he drank half a glass of whisky and soda, he stared steadily at the figure he had not seen for eight years, since—Good Heavens! and this man had done it himself! And he was as mad as a hatter.

Mr Edmund Gray looked serenely cheerful. He lay back in the long chair, his feet extended and crossed: his elbows on the arms of the chair,

his finger-tips touching; his face was wreathed with smiles; he looked as if he had always found the world the best of all possible worlds.

Athelstan heard nothing of what was said. His old friend Freddy Carstone was talking in his light and airy way, as if nothing at all mattered. He was not expected to say anything. Freddy liked to do all the talking for himself—therefore he sat watching a man under an illusion so extraordinary that it made him another man. Nothing was changed in him—neither features nor voice nor dress—yet he was another man. 'Why,' asked Athelstan, 'why did he write that cheque for seven hundred and twenty pounds?'

Presently Freddy stopped talking, and Mr Edmund Gray took up the conversation. What he said—the doctrines which he advanced, we know already. 'And these things,' said Athelstan to himself, 'from those lips! Is it possible?'

At ten o'clock Mr Edmund Gray rose. He had to write a letter; he prayed to be excused. He offered his hand again to Athelstan. 'Good-night, sir,' he said. 'To the pleasure of seeing you again.'

'Have we never met before, Mr Gray?' Athelstan asked.

'I think not. I should remember you, Mr Arundel, I am sure,' Mr Gray replied, politely. 'Besides, I never forget a face. And yours is new to me.—Good-night, sir.'

A VISIT TO THE POST-OFFICE.

STUDYING the statistics of the last Post-office Report kindled a desire in the writer of this article to see something of the working of this vast and huge machine, for without a personal visit it is perhaps difficult to gain any correct impression of its immensity, or of the perfect discipline and order which pervade the buildings devoted to postal and telegraphic work. I think it is a visit which should be made by every Londoner, if possible. They would then marvel that we get our letters and papers in the short time we do, if they were to see the thousands upon thousands that are poured into St Martin's-le-Grand day by day. As the authority who piloted me through the mazes of the building told me, the General Post-office never sleeps with the exception of Sunday between twelve and half-past one. The work is never at a standstill.

I began my visit inspecting what is known as the 'blind' department, where letters with indistinct, incomplete, and wrongly spelt addresses are puzzled out by those specially trained in solving such mysteries. Scrap-books are kept in this department, into which the curious and amusing addresses originally inscribed on the face of letters transmitted through the Post-office are copied and preserved. Whilst looking at these a post-card was handed in to one of the officials merely addressed Jackson. Whether the sender thought it would go around to the various Jacksons in London, I know not, but anyway it was decided to take the trouble to return it to the sender, advising him that it was insufficiently addressed. The trouble careless individuals give the Post-office is inconceivable, and the way some

try to cheat in the manner of registering letters needs to be seen to be believed.

From the 'blind' department I was conducted to the 'hospital,' where letters and parcels badly done up which have come to grief are doctored and made sufficiently secure to reach their destination. When it is recollected that our letter and parcel post is so cheap, the outside public might at least take the trouble to do them up properly without putting the Post-office to the enormous trouble it does, and which is done without a murmur and without extra charge. Some are put into fresh envelopes, others are sealing-waxed where slits have occurred, and others are properly tied up with string. All this trouble might be saved by a little forethought on the part of the senders.

The number of samples that different firms send through the post each day is astonishing. Mother Seigel's Syrup has reached 35,000 a day. Innumerable samples of tea go through the post daily, as well as patterns of new materials. The Prudential Insurance Company is quite a small post-office in itself, sending 11,000 despatches of one kind and another every day. It is said that 1,504,000 pattern and sample packets are posted annually in the metropolis. In addition to those just mentioned, alpaca, corduroy, gloves, ribbons, plush, whalebone, muslin, linen, biscuits, oilcakes, pepper, yeast, toilet soap, sperm candles, mustard, raisins, &c., are sent by sample post. One firm alone posted 125,418 packets containing spice.

The time to visit the sorting process at the Post-office is between half-past five and eight o'clock in the evening. At closing time the letters are simply poured by thousands into the baskets waiting to receive them, and each one as soon as full is wheeled off in an instant to the sorters and other officials waiting to deal with them. Deposited on the innumerable tables, the first process is to face the letters—not so easy a task when the shapes and sizes of the letters are so varied. As soon as the facing process is over, they are passed as quick as lightning on to the stampers, who proceed to deface the Queen's head. The noise whilst this process is being gone through is deafening. Some stampers have a hand-machine, whilst others are making a trial of a treadle stamping-machine recently introduced, and which stamps some four hundred letters per minute. From the stampers the letters pass on to the sorters. Whilst all this is proceeding, the visitor should step up into the gallery for a minute or two and look down on the busy scene below. It is a sight well worth seeing and not likely to be forgotten—the thousands of letters heaped on the tables, and the hundreds of workers as hard at work as it is possible for them to be. The envelopes are separated and placed in the several pigeon-holes which indicate the various directions they are to travel. Liverpool, Manchester, Birmingham, Edinburgh, and Glasgow have special receptacles for themselves, as the first three cities have on an average fifteen thousand letters a day despatched to each; and further, there are eight despatches a day to these places, eleven thousand per day go to Glasgow, and between eight and nine thousand to Edinburgh. All official letters—that is, 'On Her Majesty's Service'—have a special table to themselves.

Some eighty-nine thousand Savings-bank books pass through St Martin's-le-Grand daily. Some sorters get through between forty and fifty letters a minute, whilst a new-comer will not be able to manage more than twenty or thirty.

The nights on which various mails go out are extra busy ones, especially Friday evening, when the Indian, Chinese, and Australian mails are sent. The reduction of the postage has made an enormous difference in the contents of the mail-bags to these parts of the world. One would have thought, as every post-office notifies the reductions by placards, and the press also directed attention to the alteration, that it would have been known by all those interested in sending letters abroad; but letters with fivepenny and sixpenny stamps have been noticed months afterwards. It may be interesting here to note how the mails are dealt with at Brindisi. Van after van conveys the mail-bags from the train to the ship, where two gangways are put off from the shore to the ship's side. Lascars run up one and down the other with the bags. Each lascar has a smooth flat stick like a ruler, and as he deposits his mail-bag on a long bench over the hold he gives up his stick to a man standing by. When five lascars have arrived, the sticks go into one compartment of a small wooden box; and when the box is full—that is, when a hundred have been put in—the box is carried off and another brought forward. Three hundred and ninety-two bags is a good average, and they take just under forty minutes to put on board. The French and Italian mails are included in these; but no other European mails go by the Peninsular and Oriental Company. At Aden, two sorters come on board and spend their days in some postal cabins sorting the mails for the different parts of India, &c. The bags in which these mails are enclosed are only used once. They are made in one of our convict prisons, and fresh ones are distributed each week both outward and homeward.

Amusing incidents—so 'Mr Tombs, the Controller, tells us—occur sometimes even in the dull business of sorting and despatching letters. One of the clerks of olden times, in accordance with the practice of 'calling out' when the circulation of a letter was not known, amused his fellow-workers by vociferating 'Barbadoes without a county.'

Some of the latest specimens of curiously addressed letters are given in Mr Tombs' *Postal Service of To-day*; amongst these are: 'E. C. CHAMBERS seaman H.M.S. *Dana* Sarlaryhon Cape Carst Carcel or elcewhere. [Sierra Leone, Cape Coast Castle].—HERAN & SON Obanvidok [Holborn Viaduct].—RICHARD ROGAN Ship in Hunger [Chipping Ongar] Essex.—SUR GENARELL PANSELEE our Queens Privet Pus Keeper Bucom Palus.'

Turning from the General Post-office South, which is now exclusively utilised for letters and papers, I proceed to the General Post-office North, which is devoted solely to the telegraph department, and for the time being the administrative offices are housed here until the new building in course of erection close by is ready for their reception. Alterations in the Post-office buildings are always being made every year to make more room for the ever-increasing work. Cold-

bath Fields Prison has been rapidly converted into a home for the Parcel Post, and this building will be kept exclusively for parcels. The Savings-bank department was originally in the same building as the telegraph, but owing to the rapid increase in both departments, the Savings-bank has been removed to Queen Victoria Street. Some three thousand male and female clerks are employed in the telegraph department alone. The top floor of the building is devoted to the metropolitan districts. A telegram sent from one suburb of London to another is bound to pass through St Martin's-le-Grand; it cannot be sent direct. The second floor deals with the provinces. The pneumatic tube is used a great deal now, by means of which some fifty telegrams can be sent on at once, and not singly, as would be the case if the telegraphic instrument was the only instrument in use. The tube is mostly used at the branch offices. It was tried by the General Post-office to carry the mail-bags to Euston Station by means of the tube; but it was not very successful, and consequently had to be abandoned.

The press is a great user both of the postal and telegraphic department. In the postal department the representatives can call for their letters at any hour, provided they are enclosed in a distinctive-coloured envelope, such as bright red or orange. Of course this privilege has to be paid for. In the telegraph department the press can obtain their 'private wires' after six in the evening, as the wires are no longer required for commercial purposes. The plan adopted in sending the same message to every provincial town which has a daily journal is the following: all along the route the operators are advised of the fact, and whilst the message is only actually delivered at its final destination, the words are caught as they pass each town by means of the 'sounder.' By this ingenious arrangement, dozens of towns are placed in direct communication with the central office whence the message is despatched. To carry on our telegraphic arrangements three miles of shelves, on which are deposited forty thousand batteries, are requisite.

Such are some of the interesting features of this marvellous machine, which is ever in motion, and assisting in no small degree to realise the dream of 'universal brotherhood.'

THE MAYOR OF SAWMILL FLAT.

By WILLIAM ATKINSON.

IN TWO CHAPTERS—CHAP. I.

It was the 1st day of September 1888. In far-away New York City good citizens were either in bed and asleep, or were preparing to retire; in more remote London, the milkmen and market-gardeners had already opened up the business of a new day; but in South-western Arizona it was the hour of sunset.

Seated upon a camp-stool, in front of a frame-shanty that boasted two small apartments, was a man, handsome in spite of his rough dress and weather-tanned countenance, but prematurely gray and careworn. His white locks betokened threescore years at least; but if the register of

a certain parish in the North Riding of Yorkshire tells the tale truly, John Lee was born in the year of grace 1850, and was therefore just thirty-eight years old. A shingle protruded from the entrance of the rude cabin, upon which some apprentice hand had printed the legend—'DR JOHN LEE, Physician and Surgeon.'

Now, although Dr Lee was the only medical man within forty miles in every direction, he was not overburdened with patients, and had long since arrived at the conclusion that, viewed from a professional standpoint, Sawmill Flat was altogether too healthy a locality. Indeed, on this especial September evening he had been calculating the length of time since his services were last in requisition. He found that it was exactly eight weeks since he extracted a bullet from Tombstone Hank's hip—placed there by Hank's bosom friend, upon the occasion of a slight difference over a friendly game of Seven-up—for which the grateful Hank had paid him six dollars—nominally as a ten per cent. deposit, but in reality as payment in full. It will be readily conceded, even though Arizona doctors are not compelled to purchase dress suits, attend receptions, and make their professional calls in broughams, that six dollars is, to say the least, a thin income for two months; so it is scarcely surprising that John Lee was about resolved to

Fold his tent, like the Arabs,
And silently steal away;

or, in the more concise language of Saw Mill Flat, to 'dig out.'

For a man who had spent his boyhood's days in one of the most picturesque of the North Yorkshire dales, the prospect from John Lee's shanty door was not particularly inspiring. Immediately before him was the Santa Fé Trail—that great South-western emigrant road along whose thirteen-hundred-mile course hundreds of scalpless corpses have been left to rot in the summer sun and bleach in the autumn winds. Half a mile down the trail could be seen the score of low shanties occupied by the workers—who were also shareholders—in the Big Bug Silver Mine, whose location was betrayed by the huge derrick and pulley-wheel rising high above the cabins. Beyond the mine—south, east, and west—was an endless expanse of waste sandy soil, which sustained no life save that of the deadly rattlesnake.

To the north the view was not quite so dismal, although it was dull enough. More than a mile away, surrounded by a clump of dwarfed cottonwood trees and sickly oaks, was the sawmill which gave the name to the settlement; while stretching away as far as the eye could reach rose tier above tier of low sandhills, that finally merged into the desert mountain range which crosses Central Arizona. Before the setting sun reached the horizon, John Lee was so disgusted that, as he had done many times before, he took refuge in a pipe of tobacco and shut out the view with thick clouds of smoke.

Now, because Tombstone Hank had settled with

the Doctor upon 'the instalment plan,' it must not for a moment be supposed that Sawmill Flat was the home of a poverty-stricken community. Lacking it may have been (and was) in fine scenery and other natural advantages as well as in good society, schools, churches, and other refining influences; but in gold and silver—especially silver—by no means. For two years the output of the Big Bug Silver Mine had been enormous, and had made rich men of at least a dozen of the citizens of Sawmill Flat; while Jim Hawkins, the proprietor of the sawmill, and Andy Dunbar, the keeper of the general store, both had, in addition to their respective properties at Sawmill Flat, healthy balances at the First National Bank of Tucson. As a matter of fact, money was literally 'no object' to some of the Sawmill Flat people, who frequently paid most extravagant prices for the commonest necessities of life, but lived on and toiled on in the hope that railroads yet unbuilt would some day bring the outside world to their settlement; or else that they themselves, when rich enough, would leave Arizona Territory for the comforts and civilisation of 'the States.'

The clouds of tobacco smoke from John Lee's pipe so effectually shut out the Doctor's immediate surroundings, that he speedily lost himself in a maze of thought, and was considerably startled when a loud voice exclaimed: 'Evenin', Doc.'

'Good-evening, Hawkins.'

'Going along, Doc.?'

'Going along where?'

'To the Flat. Where else? Come, hurry up, Doc.'

'Why, what's going on? I've been as far as the mine once to-day, and it will soon be my bedtime. No; I think I'll not go, Hawkins.'

'Not go? Why, man alive, it's the night of the town meeting. Come on!'

'Meeting? By Jove, that's a fact, though I had clean forgotten it. Anyhow, what's the use in me going to the town meeting? No; I won't go.'

'Confound it all, Doc., ain't you a public-spirited citerzen? Ain't you a real-estate man? Ain't you a man of edgercation? Don't you live at Sawmill Flat, anyhow, and ain't this a meetin' of Sawmill Flat townsfolks?'

John Lee felt compelled to laugh at this man's curious but earnest appeal, and the laugh temporarily dispelled his blueness. Hawkins was a pretty shrewd man, and, in his way, he was generous too.

'You're down in the mouth, Doc., that's what's the matter with you. Don't you lose heart so quick, pardner, for this here place is jest agoin' to strike ile, sir, you bet! In two years from now the City of Sawmill Flat will have five thousand people and five railroads; and your two hundred acres, that you'd be derved glad to get two hundred dollars for to-day, will be cut into streets and sold at high prices for city lots.—Bless my soul, Doc., you'll soon have a big city practice, and be a millionaire land-owner to boot.'

'Meanwhile?' grinned the Doctor.

'Meanwhile, if you want a nugget or two to help you out, you know where old Jim Hawkins lives, don't you?'

'You're very good, Hawkins—very good. Well, I'll go down and look on.'

The two men took several paces in silence. Then, with much abruptness, Hawkins asked: 'Why don't you merry Andy Dunbar's darter? Jen would say "Yes" too quick; and Dunbar would be tickled to death, and set you up in good shape. Why don't you do it, Doc.?'

John Lee pulled at his gray moustache for some moments before he replied: 'Hawkins,' he said, 'a few months ago you showed your good-will to me, so I will answer your question. I broke one girl's heart, and that is sufficient for me. I do not love Jenny Dunbar, and I shall run no more risks where a good woman is concerned.'

'Doc,' said Hawkins bluntly, 'I ask your pardon, sir.'

Sawmill Flat formed part of the town (or township) of San Bernardino, a district fully as large as the English county of Lincoln, settled by a sparse population of but two or three hundred, most of whom resided at Sawmill Flat. Looking to the future, this township had been formed for local government purposes, the chief executive being none other than Jim Hawkins, who was known as the Reeve. The other township officers were one Eliphalet Younghusband, Justice of the Peace, and his constable, Pedro Lopez. The law called for a town meeting twice a year, when all the male residents of legal age were entitled to give voice to their opinions and to present resolutions, &c., regarding public matters. Hitherto, during the six years' history of San Bernardino the town meeting had been systematically ignored by the citizens. But on the present occasion the Sawmill Flat people intended to boom their settlement, and become incorporated under the municipal laws of Arizona as a City. No cash and no enthusiasm was to be spared to bring about the desired result.

The meeting was held in the town-hall, which was a room about twenty feet square, and was attended by well-nigh every resident of Sawmill Flat. No time was lost in appointing the Reeve and the Justice a deputation to wait upon the Governor of Arizona for a charter; nor was it long before fourteen thousand dollars was subscribed to be spent in erecting a new City Hall and an Hotel, in sinking wells for a water-supply, and in widely advertising the advantages and glorious outlook of the new City.

This having been done with much unanimity, Chairman Jim Hawkins arose to make a speech. 'Boys—Feller Citirzens, I should say—from the looks of things, the City of Sawmill Flat will come into existence on the 1st day of January 1889. When it does, we want a man to take charge—a good man and a smart man. We don't want no shyster for Mayor, which we are pretty sure to get if we don't make the office a liberal paid one. We want a competent man, a man with a level head, and a man with interests in Sawmill Flat. In other words we want one of ourselves, and one of our best selves at that. Now, you fellers as know how to do things up in proper shape can make a good living, and you ain't going to neglect your business to run this city for next to nothing a year. We ought to pay the Mayor of Sawmill Flat a salary of at least five thousand dollars, and then he'll do the

fair thing—at least, if he don't, we can string him up or tar and feather him.'

This proposition of the Reeve's was also duly moved and seconded without a dissident.

But the salary question being settled, there were many aspirants for the honour of the nomination to be first Mayor of the new City. The meeting now took the form of a genuine political caucus; and some sensation was caused when, after two or three names had been mentioned, Joe Brice got up and said: 'Gents, I nominate my old pard, Zack Pegg. Zack is a rich man, and an old settler in the Flat, and he 'lows that if he's 'lected Mayor, he'll donate his entire salary to the citizens, which I think is handsome and generous.'

But Jim Hawkins suddenly vacated his chair and took the floor. 'Justice,' he said, 'have the kindness to preside for a few moments while I say my say. This here generosity of Zack Pegg's puts me in mind of the man what got pretty hungry and cut off his pet dog's tail, which he biled and eat, and then gave the bone to the dog. Zack would only be giving back to the boys what he got from them, which wouldn't be much of a virtue in Zack, seeing as he's a-rolling in boodle. But don't you see, boys, it's considerable like bribery to make such offers; and if Zack did get elected on any such scheme, he might find himself in the pen. [penitentiary], instead of Mayor of Sawmill Flat. No; I've got a name to propose that I think will fill the bill. It's the name of a clever man and a well edgercated man, a man of experience, a man who owns real estate in this town, and a man that's one of ourselves. He needs the money that will go with the office of Mayor; and because he needs it, he'll try to earn it. I erlude to Doc. Lee; and he's a blamed good feller, as we all know.'

The Doctor's name was cordially received, and there was a hurrah as Hawkins resumed his seat in the chair. John Lee was well liked in the Flat, except by one or two new-comers.

One of the new settlers arose as Hawkins sat down. 'Feller-citizens,' said the man, 'I take it that you meant what you said at the outset when you resolved that the Mayor of Sawmill Flat must be a good man, an honest man, and a man with a clean record. Now, I don't suppose you want a jail-bird—a murderer, for instance—a'

There was an angry buzz of voices, and many a hand found its way to a pistol-pocket when the insinuation was uttered. But anger changed to surprise when the audience discovered that the speaker was looking squarely at Lee, whose face was a deep crimson. When, therefore, Hawkins called for order, quiet was quickly resumed.

'Gentlemen,' said Lee in a low voice that noticeably shook with violent agitation, 'I beg very respectfully to withdraw my name from the consideration of this meeting. On no account will I permit my name to be presented for the Mayoralty.—Mr Reeve, if it is within your province, and if you will do me a favour, I should like you to adjourn this meeting for one week, when I will request the privilege of addressing my friends—and others—in this room.'

It was well for John Lee, as well as for the man who had cast so terrible a slur upon him, that he promised what was evidently to be an

explanation at a future meeting. Otherwise, there would probably have been a terrible uproar that night in the embryo City of Sawmill Flat. As it was, Dr Lee's request was complied with, and the meeting stood adjourned for one week.

ROYAL MUSICIANS.

It is perhaps not generally known that the late Duke of Clarence, although no brilliant executionist, had inherited the keen ear for and love of music with which his father is endowed, and which, it may be said, distinguish all members of the House of Guelph. The Princess May of Teck, too, is generally known to be a clever musician. These reflections call to mind how many royal personages of the present and past day are likewise endowed.

Lord Chesterfield said cynically: 'If you like music, listen, and pay the violin-player for it; but never play yourself. It makes a man look stupid, and often brings him into bad company, wasting time that might be otherwise well spent. Not so Luther; for in his excellent and sound sermon on Music the great reformer says: 'Kings and Princes should exercise and patronise music; for great potentates ought to patronise noble and useful arts, as even if private persons seriously wish to do so, they are far from having the opportunities of the Great. We learn, indeed, from the Bible that mighty and God-fearing kings supported and rewarded singers.'

If Lord Chesterfield's words held good, many Princes of the past and present time would not be considered 'gentlemen.' But happily on this point the great moralist was wrong; for we all know, for instance, of the keen delight with which the Duke of Edinburgh practises violin-playing, His Royal Highness having even on several occasions performed in public with much distinction, as, for example, once in a quartette at the Albert Hall, and more recently 'solo' at Plymouth. In fact, the Duke's enthusiasm for the art is so great that he has expended a small fortune in the purchase of the instruments of old Italian masters. Again, both his brothers, the Prince of Wales and the Duke of Connaught, have their musical 'hobbies'—the former, at all events, at one time not very long ago, delighting his intimate friends with performances on the banjo, an art which, by the way, His Royal Highness rapidly acquired, and that at a comparatively late time of life; whilst the Duke of Connaught beguiles many a leisure hour with the 'silvery flute,' an appropriate instrument for the 'Irish Prince.' Prince Leopold was also a gifted pianist.

The Queen plays no longer; but in former days Her Majesty was habitually found at the organ—her favourite instrument. Mendelssohn relates how surprised he was, during a visit to Buckingham Palace in 1844, at finding the Queen and the Prince Consort so 'musically finished.' 'The Prince,' says the great composer, 'played a chorale on the organ so beautifully and correct that the performance would have done the highest credit to any professional artist.' And when presently Mendelssohn performed 'How lovely are the Messengers,' the Queen and the Prince Consort, carried away with enthusiasm, began to sing; 'and, later on, I accompanied the Queen at several

songs, which Her Majesty sang with great warmth of feeling and true artistic expression.'

The Princess of Wales is a skilled pianist; and not long since the Princess Beatrice made her début as a composer with a pretty song, 'The Sunny Month of May.' And here, dealing with musicians of the House of Guelph, it may be in place to mention that Prince Henry of Prussia—brother of the Emperor—is also no mean composer, pianist, and violin-player, his productions, however, being of a martial order. On several occasions they have been played before the Queen at dinner, a particular graceful act of Her Majesty being to select one of his Royal Highness's 'morceaux' for performance on the occasion of the visit of the Emperor and himself at Osborne at the grand banquet given in their honour.

Turning to foreign courts, we encounter a host of gifted royal musicians. We have, in the first instance, the Czar, an actual 'worshipper' of music, His Majesty's personal 'forte' being singing. And when in Denmark his greatest pleasure is to invite the students to sing their glees and ballads before him and his relatives in the evening, His Majesty often leading or joining in the same. The students of the North are—as visitors to Lands of the Midnight Sun are aware—particularly distinguished for their part and chorus singing. Needless to say the Czarina also delights in hearing the well-known Norse ballads of her childhood. All the children of the Czar and Czarina are likewise endowed with a deep love of music, particularly the youthful Grand-duchess Xenia.

Crossing the waters to the Swedish court, we find another royal musician in King Oscar, who may often be heard for hours 'fantasera' on the piano, and more particularly on the organ—an instrument almost unknown in private circles abroad. His Majesty is also, like the Czar, a great lover of glee-singing; and not so long ago he appeared unexpectedly one night at a concert of the Masonic Lodge in Stockholm and took part in the glee-singing of the elder members, His Majesty's voice sounding fine and manful in spite of his threescore and a half years. His brothers, Charles XV., and Gustavus—who died at the same age as the late Duke, or who would otherwise have succeeded to the throne—were equally gifted musicians and lovers of that noble art; and, as recently stated in the pages of the *Gentlewoman*, Prince Gustavus Adolphus, the eldest grandson of King Oscar, and future king, already evinces that admirable early love of music which is the heirloom of the gifted House of Bernadotte.

The king of Portugal likes to pose as a violin-player, although his teacher, Professor Casella, appears to have been more of the courtier than the musician, for on one occasion, we are told, His Majesty, after many unsuccessful attempts, at last mastering a difficult passage, he said to the Professor: 'Candidly, now, how *did* I play that?' The answer was: 'Sire, what Princes perform is invariably good.' But a similar though somewhat stinging answer was made by Handel to a German sovereign that shall be unnamed, who asked the king of oratorios 'how he played.' 'Your Majesty,' responded Handel, 'plays *like a Prince*.'

Coming to other courts, the charming Queen Margherita is styled 'a brilliant pianist,' and

what is termed by masters 'thoroughly musical.' And here is an excellent illustration of the words of Luther, as well as of Her Majesty's true love of music. When last summer paying a memorable visit to Venice—memorable through the significant presence of the Mediterranean fleet and the pick of the Italian navy—Her Majesty visited the famous Library of the Doges, and here were shown her some old manuscripts by Stradella, Monteverde, and other famous Italian masters, when, without a moment's hesitation, the real 'Queen of the Adriatic' ordered that they should be published forthwith, adding: 'They will thus delight the world far more than being buried in a glass case!'

Touching the Empresses of the world, we are aware that the Empress of Austria is a charming performer on that curious and heart-stirring instrument of her land, the zither; whilst the consort of the Mikado—as those rare visitors from Europe that have had the honour to ascertain testify—is equally 'at home' on the native string instrument, the 'koto.'

To examine the list of royal musicians closer, it appears that the gifted 'Carmen Sylva' is a fair pianist, but a far more brilliant harpist, stringing the 'lyre of Roumania' to the weird folklore songs of that strange nation. Finally, we may mention that King George of the Hellenes, brother of the Princess of Wales, shows a curious ear for music by delighting in playing all kinds of melodies on the 'glass zither' and wine-glasses, besides handling with great skill the cymbals.

Such is a cursory review of the princely musicians of our own age. But harking back, we find the same love, if not general brilliant execution, of 'the art that charms a savage breast.' For we know as an historical fact that that curious mixture of statecraft, superstition, and 'amour,' King Henry VIII., composed two entire masses, often sung in His Majesty's private chapel, and that a good deal of his time was occupied with more or less artistic performances on the flute! In addition, the great Tudor king is said to have set to music several madrigals and composed some ballads. Indeed, few readers would believe that some of the much-abused king's compositions have endured to the present day, and indicate beyond a doubt a remarkable musical talent, and that, too, developed—very rare, and the more remarkable if we bear in mind the crude and coarse bent of the times.

Queen Elizabeth performed, we are told by her admirers, with wonderful dexterity on the 'spinet,' or, more correctly speaking, on the 'virginal,' an earlier form of the same, resembling a harpsichord. And here Dr Burney relates a good story, which not only confirms but also clearly indicates that Mary, Queen of Scots, should rank among royal musicians. 'Sir James Melville,' says the celebrated historian, 'relates a remarkable conversation with Queen Elizabeth, when, as envoy of Queen Mary in 1564, he was despatched to her court. Having inquired how the Scotch queen dressed, the colour of her hair, whether prettier than her own, who was the most beautiful, who was the taller, Queen Elizabeth asked what she occupied her time with. "I answered," says Melville, "that when serious affairs of state permitted, Her Majesty studied history or amused herself by playing the lute or the

virginal." "Is she a good player?" said Queen Elizabeth. "Irreproachably for a queen," was my answer. The same afternoon, Lord Hunsdon took me to a gallery at the Palace to hear some music—it was the Queen playing the virginal. Having listened for a time, and lifting the curtain, I beheld Her Majesty; but having her back turned towards me, I looked for a while. Suddenly, she turned and saw me, appeared surprised, and then indignant. Presently, I was called, when she said she only played to avoid being melancholy. Next she asked who played best, Queen Elizabeth or Queen Mary. I of course gave the prudent answer that Her Majesty was the superior executionist.'

Charles I., we are also told, played the violoncello or bass-viol with great precision; and James I. of Scotland was endowed with such a keen ear and musical nature that several old traditional Scottish songs are attributed to him. He maintained at his court a host of lute, harp, violin, and horn players, who, it is shown by accounts, were paid regular salaries. It is even said that King James was the sovereign who introduced the organ in the kirk.

Frederick the Great was an enthusiastic musician and a first-rate flute-player. It is said that sometimes, after a victorious battle, he would repair to his tent and amuse himself with his favourite instrument. And the Czar Alexander I., although his father, in blind autocracy, prohibited his learning it, practised and loved music all his life.

Finally, nearly every Emperor of the House of Hapsburg has been musical, and some even composers of considerable merit. Leopold I. was an excellent pianist and a composer of arias and cantatas displaying great musical talent. And Queen Hortense, mother of Napoleon III., has rendered herself famous by composing 'Partant pour la Syrie.'

Truly, the list of royal musicians might be extended indefinitely; but those quoted will go to show that Princes and Princesses are not behind ordinary mortals in love of one of the most noble and soul-stirring gifts of Nature.

IN A SILENT SEA.

SOME years ago I was homeward bound from the East Indies. We had rounded the Cape without getting the usual dressing, and had picked up the South-east Trades much sooner than we expected. Everything had so far been in our favour, and it was only when we got into the latitude where we ought to have picked up the North-east Trades that, instead of the usual breeze, we came in for nothing but a succession of light winds and variables. With these we gradually worked along until we got into about twenty degrees north latitude, when we had a calm for two days. Shortly before midnight on the second day a light breeze sprang up from the southward. There was only enough wind to keep the sails full, and we glided along at about two knots an hour, with lazy little bobs to a swell that came up from the eastward. All that day the breeze continued light. The sun beat down with tremendous power, and towards noon the breeze died almost entirely away, though the swell continued with long, low,

regular undulations. Away on our port bow heavy clouds began to appear on the edge of the horizon, and the glass was falling rapidly.

I was at the wheel in the first dog watch. We lay heading all round the compass, the ship having no steering-way, and I watched the bank of clouds gathering ominously on our port quarter. The sun seemed to set in a perfect atmosphere of sulphur, leaving some angry-looking streaks of red and gold that gleamed like flashes of lightning suddenly arrested. The skipper paced the quarter-deck, occasionally diving below to look at the glass, and each time returning with a more anxious countenance, and saying to the mate that he had never seen the glass so low since he had been to sea.

'We'll reef her right down at four bells, Mr Jarvis,' he said; 'for there's everything good, bad, and indifferent mixed up in those clouds, like an Irish stew.'

As soon as the watch came on deck, sail after sail was clewed up and furled, until we had nothing on her but the two lower topsails, fore-topmast staysail, and storm staysail. The ship, now denuded of her sails, stood out like a skeleton against the background of copper-coloured clouds. The men began to get somewhat depressed, as with a sky and atmosphere like that we knew it was no ordinary blow that we had to expect; and I could hear the shrill voice of a little shrivelled-up old seaman named Lester croaking more than was his wont, and calling to mind the time when he was in the China seas some thirty years before; how the clouds had gathered up in the same way, and how the ship foundered, and all hands were lost except himself.

'Here! cut that yarn,' said one of the men. 'You're a regular old Jonah!'

The watch below turned in at eight bells, having been cautioned to be ready for a rouse-out. I paced the deck for some time. The captain and the mate were discussing the dirty appearance of the weather. The ship looked absolutely desolate, with her long bare masts tapering away into the darkness.

'I don't like the way that stuff hangs about,' said the skipper; 'when it does come, it will come with a run.' Here and there a star would faintly show itself, and the sea glittered with phosphorescent lights. Hour after hour we lay under the shadow of those dense clouds, waiting for the storm to burst. The watch dragged wearily on till close on midnight, when suddenly a bright flash of lightning seemed to part the clouds asunder; then others followed in quick succession.

'We'll catch it directly,' piped the shrill voice of Lester, and he was right. Scarcely were the words uttered when we heard a roaring sound in the distance, which increased into a whirling shriek. In an instant it was upon us. Fortunately, it struck us on the quarter. The ship for a moment plunged forward, burying her bows in the sea. At the same instant there was a terrific bang as the topsails were blown clean out of the bolt ropes; there was not a stitch of canvas left on her, and we scudded under bare poles, the sea bubbling around us, a mass of seething foam. It was impossible to stand upright, and we had to crawl about as best we could.

We were thankful when daylight came, as the

horrors of the storm had been much intensified by the pitchy darkness. When the sun rose, sea and sky presented a wild and grand sight. The scud was flying above us, and the foam below. Everything was rushing madly before the hurricane; there, alone on this wild and desolate world of waters, was our gallant ship staggering before the mighty blast, and fighting the waves like a living thing.

For two whole days and nights we drove along, accompanied only by the incessant roar of the storm. On the third night the ship seemed to lose her buoyancy, and by the heavy deadened way she rose and fell, we thought she had sprung a leak, for her motion was now more like that of an old water-logged Quebeccar than of an East Indian clipper. About midnight we sounded the well, but she was as dry as a bone. The sea also became much smoother, and we seemed to be simply rising and falling on a huge swell, instead of going through a heavy sea. As the night wore on the force of the wind greatly abated, inasmuch that we were able to get new topsails from below and make them ready to bend. It was intensely dark, and as the hurricane went down an awful stillness prevailed. It seemed as if the continued shrieking of the storm for the last three days had affected our sense of hearing, or else there was something strange, as no one could hear the swish of the sea, and no water came aboard. We simply rolled about in absolute silence.

The wind gradually died away until it was a dead calm. We lay aloft and bent the new topsails; and by the time we were ready to hoist the yards the morning was beginning to break.

As daylight came on we were astonished to find that, instead of being in a clear open sea, we seemed to be in a huge green meadow-land. As far as the eye could reach there was nothing to be seen but a heaving mass of green. We had been driven into the midst of the Sargasso Sea. This accounted for the way she had laboured, and the deathlike silence which prevailed. The weeds were already clinging to the sides and bow of the vessel. The sun rose clear and bright, and as the day advanced the heat was excessive. There was not a breath of wind anywhere, so that we lay utterly helpless amidst this tanglement of weeds. We could do nothing now but wait for a breeze to release us. During the day the swell went down, and by night we lay quite motionless, and with a most appalling stillness reigning around.

The night was beautifully clear, and the stars shone out brilliantly; so we spent our first night amongst this sea of weeds and grass, rather pleased than otherwise at the quiet, which was a relief after the three days' incessant shrieking of the hurricane. At sunrise the calm still continued, and the men began to get impatient for a breeze. The day was occupied in scraping the weeds from the sides of the vessel. The heat was intense; there was not a breath of air, and the sky was without a cloud. As far as the eye could see, even from a royal yard, nothing was visible but one unbroken plain of floating weed. The frightful stillness of everything was the worst part of it. Hour by hour it became more oppressive. It was a silence so intense that one seemed to hear it, and by sundown even the nerves of the roughest old seaman had become so unstrung, that

the putting down of a pannikin made every one start. Day after day went on without even a catspaw of wind, and the captain soon saw that the only thing to keep up the men's spirits was to give them plenty of work. We painted the ship, tarred down, scraped, holystoned, and did every other conceivable kind of work until it became hard to find anything else to do. Curious kinds of creatures crawled about on the top of the weeds, gazing at our unfortunate craft with their meaningless fishy eyes.

When we had been thus becalmed for three weeks, the captain thought it advisable to put us on a short allowance of food and water, as there seemed no more prospect of a breeze now than there was on the day in which we had first got entangled. At first we tried to get up entertainments, but no one seemed to have heart for anything, and all our attempts at amusements failed. The one absorbing thought of the whole crew—morning, noon, and night, waking or sleeping—was, 'When shall we get a breeze?' What preyed on our minds most was the appalling stillness. It hung round us like a funeral pall.

One night, whilst the crew were lying about the deck trying to sleep, I was suddenly roused by a voice shouting: 'Let go your royal hal-yards.'

In a moment every one was on the alert, thinking and hoping that we were in for a breeze. It was a bright moonlight night, not a cloud was to be seen. On the forecastle head stood a seaman waving his arms and calling out that a squall was approaching.

'Where away?' shouted the mate.

'Let go!' he yelled in reply.

We now saw that the poor fellow was raving, and immediately a couple of hands secured him. He became very violent, so much so that it became necessary to put him in irons. All that night the poor fellow raved piteously, chiefly about his wife and child, who he thought were stowed away in some place, all alone, and where all was silence. For three days he refused to eat or drink, and appealed incessantly to us to let him go and help his dear ones.

On the fourth morning of his illness it was my turn to watch him. He had been lying quiet for some time breathing heavily. Presently he struggled violently, and I had to call for the assistance of another man to hold him down. Suddenly, with a supreme effort, he burst the irons from his wrists; but the strain had been too much, and he lay back exhausted for a few minutes. Then raising himself on his elbow, he looked round in a dazed way, and putting his hand in mine, said in a quiet voice: 'The silence has gone now, Kitty!' and died.

Now that the ravings of this poor tar had ceased, the silence seemed even more awful than before; and the skipper, in order to keep the men from brooding, ordered a couple of boats to be got out and efforts made to tow the ship clear of the weeds. Our first business was to bury our dead; and as soon as the long-boat was over the side, we lowered the corpse into it. Poor old Jack! he had been a good shipmate, though always rather sentimental! Four A.B.s and the mate manned the boat, and with much labour and difficulty they managed to get her along until she was about one hundred yards away. We

then saw two of the men parting the weeds with the blades of their oars, so as to form a grave. The mate stood up in the stern-sheets and read the burial service, whilst the body of poor old Jack lay across the midship thwarts. I shuddered as I saw him dropped over amongst the dark clinging weeds.

'Oh!' said Lester in his shrill voice, 'there goes the first; I'll warrant it won't be the last.'

'Croaker,' some one remarked; and we set to work to get the other boat over, whilst the funeral party made their way back to the ship.

For a whole week we tried all possible means to shift her with the aid of the boats, but it was not of the slightest use; for if we cleared the tangle of weeds away one day, they were as bad as ever the next; so after a time we gave up this work in despair. Two more of the men now became light-headed, and had to be put under restraint. Day by day things became more desperate, and to our horror we saw that the food and water could not hold out much longer.

The skipper and the mate, after a long consultation, determined to provision a boat and send her to find out how far it was to the open sea.

The mate and four seamen, myself amongst the number, formed the crew. We started at day-break, and made our way slowly along. When night came, we could still see our vessel across the flat extent of green; but we had made fairly good progress, as she was hull down. We divided ourselves into two watches, so that we could keep going both night and day. After three days of this, we found the weeds getting much scarcer, and for the first time for six weeks we felt just a flutter of air. Upon this, the mate determined to return and make another effort to tow the ship. When we got back to the vessel, our report somewhat raised the desponding spirits of the men; and it was arranged to make one great effort to tow the ship away on the morning after our return.

That night one of the sick men died. We buried him at sunrise in the same manner as his shipmate, and then started the work of towing. For hours we toiled, the skipper encouraging us from the poop.

'There she moves, my lads—that's it—keep her going,' and so on, though I don't think we moved her half a fathom the whole day; and when we returned aboard at nightfall, every one felt more disconsolate than ever. Even the captain, who had always appeared to keep his spirits up, seemed thoroughly downcast; and the deadly stillness was only broken occasionally by the cries of the poor fevered man below.

I lay down on the main hatch to sleep, but found it impossible. I was a good deal distressed at the death of the man we had buried that morning, who had been a great chum of mine; and I lay on my back looking up at the starry heavens, wondering if we were to die off one by one, and if so, who would be the last. The more I thought, the more morbid did my thoughts become. In time the vessel would be carried out of the bed of weeds by some storm or current, and when picked up, there would be no one to explain how the crew had all gone mad, and died miserably, killed by the utter silence. I grasped my head with my hands. Was I to be the next? Oh God! I could feel my brain going.

The fearful stillness seemed to come over me in huge waves. I prayed hard and wept desolate tears. I had no energy to move or speak. The sense of overwhelming stillness overpowered me and made me absolutely helpless. Suddenly I heard the mate shout out: 'Port main-brace.'

At the same instant a gentle puff of air swept across my face, and the sails that had been hanging idly for so many weeks filled out to the gentle pressure of the breeze. This brought me to my senses. The frightful feeling in my head vanished as I joined the others in trimming the yards. Yes, there was a breeze, but very, very light. The royals and topgallant sails appeared to be drawing, but we did not seem to be in motion. Presently the captain suggested putting a lighted tarpot over the side, to see if we were making any way. We were only just moving. Men dared hardly speak lest their voices should drive the breeze away.

When the sun rose the wind freshened, and by eight bells we were perceptibly moving. We brought our sick man on deck, hoping the breeze would revive him; but he never rallied, and died that night; and as we dropped him over the side, the voice of Lester could be heard saying: 'Number three gone! We ought to get along all right now.'

'You're the Jonah,' replied his shipmates. 'If we had put you overboard at first, we might have been in dock two months ago.'

In two days' time we once more heard the splashing of the sea as the waves danced and curled around the ship's side, carrying the weeds that had grown to her for yards to leeward. Thus, after a captivity of fifty-three days, we found ourselves again on the restless ocean; and even the roar of angry billows was the sweetest music to us, after our long imprisonment in the 'Silent Sea.'

TABLE TRAITS.

To many of us there is an inexpressible magic in the sound of the word 'dinner'—a certain boding of something good, far more telling than thousands of its brethren in the dictionary. We beget a fondness for it, like the armature for its poles. But the derivation of the word is much more hazy than its meaning. It is believed by some that it springs from a corruption of the words *dic-heures*, indicating the time at which, in the old Norman days, this meal was taken. The mere idea of having dinner at the barbarous hour of ten o'clock in the morning would in all probability send a modern *chef* into a fit; yet it was at this early time that persons of quality, both in this country and in France, partook of the meal. Froissart mentions waiting upon the Duke of Lancaster at five in the afternoon, after he had supped; and during the reigns of Francis I. and Louis XII. of France, fashionable people dined from half-past ten, and supped at the latest at six in the evening. And again, from a Northumberland Household Book, bearing date 1512, we learn that the family rose at six, breakfasted at seven, dined at ten, supped at four, and shut the gates at nine P.M. Speaking generally, though the dinner hour then, as now, was later in this country than in France, Louis XIV. did not dine

till twelve; whilst his contemporaries, Cromwell and Charles II., took the meal at one. In 1700, the hour was advanced to two; and in 1751, we find that the Duchess of Somerset's dinner-time was three. In 1760, Cowper speaks of four o'clock as the then fashionable time. After the battle of Waterloo, six P.M. was the time at which the *beau-monde* took their substantial meal; while at the present day many of the nobility do not dine until eight or nine; so we see that, through four hundred years, the dinner-hour has gradually moved through twelve hours of the day—from nine A.M. to nine P.M. When the dinner hour was so early, often no previous meal was taken.

The Romans, in the time of Cicero and Augustus, took an early breakfast, from three to four in the morning, a luncheon at twelve or one, and at about three o'clock the *cæna*, or principal meal of the day, corresponding with our dinner. Concurrently, we read of some not dining until sunset. A Roman dinner at the house of a wealthy man consisted chiefly of three courses. All sorts of stimulants to the appetite were first served up, and eggs were indispensable to the first course. Amongst the various dishes we may instance the guinea-hen, pheasant, nightingale, and the thrush as birds most in repute. The Roman gourmands held peacocks in great estimation, especially their tongues. Macrobius states that they were first eaten by Hortensius, the orator, and acquired such repute that a single peacock was sold for fifty denarii, the denarius being equal to about eightpence-halfpenny of our money.

As exemplifying the pitch to which Roman epicureanism was carried, and indicative of a truly barbaric nature, a dish consisting of the tongues alone of some thousands of the favourite songsters of the air was requisitioned at immense cost to satisfy the inordinate cravings of one of the emperors. One can hardly avoid the reflection that such a being must have been extremely untuneful. The liver of a capon steeped in milk was thought a great delicacy; and of solid meat, pork appears to have been most relished.

The staunch Roman who did not take his pleasure homeopathically, reclined during dinner on a luxurious couch, his head resting on his left elbow, supported by cushions. Suetonius draws attention to a superb apartment, erected by the extravagant Nero, in which his meals were partaken, constructed like a theatre, with shifting scenes changing with every course. The amount of money often expended by the wealthy Romans on their sumptuous meals appears fabulous. Vitellius is said to have spent as much as four hundred sesteria (about £4228 of our money) on his daily supper; and the celebrated feast to which he invited his brother cost no less than £40,350! It consisted of two thousand different dishes of fish, and seven thousand of fowls, with other equally numerous meats. His daily food was of the most rare and exquisite nature; the deserts of Libya, the shores of Spain, the waters of the Carpathian Sea, and even the coasts and forests of Britain, were diligently searched for dainties to supply his table; and had he reigned long he would, observes Josephus, have exhausted the great opulence of the Roman empire. By the way, we wonder if these happy-go-lucky Romans

ever suffered much from indigestion! Of one thing we are certain, that in order to render the bridge from one feast to another less tedious, an occasional resort was had to the persuasive powers of an emetic. The extravagance of these times was indeed so boundless, that to entertain an emperor at a feast, unless you were a Cræsus, were to encounter almost certain financial ruin—literally, to be eaten up. One dish alone at the table of Heliogabalus has been known to cost a sum equal to four thousand pounds of our money.

No wonder, therefore, observes a recent writer, that these imperial feasts were lengthened out for hours together, and that every artifice, often revolting in the extreme, was used to prolong the pleasure of eating; or that Philoxenus should wish that he had the throat of a crane with a delicate palate all the way down. Many of the guests at such feasts, long before the close, must have been in the condition of an editor who, when asked at a public dinner if he would take some pudding, replied in a fit of abstraction: 'Owing to a crowd of other matters, we are unable to find room for it.' The elegant Romans declared that a repast should not consist of a less number of courses than the Graces or of more than the Muses. According to ancient rule, an invitation not replied to in twenty-four hours was deemed accepted; and from an invitation given and accepted, nothing released the contracting parties but illness, imprisonment, or death.

At a Saxon dinner, the dining-table was oblong and rounded at the ends. The cloth was a rich crimson, with a broad gilt margin hung low beneath the table. The company sat upon chairs with concave backs, and were arranged with regard to the sexes, much as at the present day. The dishes consisted of fowls, fish, flesh of oxen, sheep, deer, and swine, both wild and domestic—not excepting certain portions of the sea-swine or porpoise—a food at present little cared for, but at that period no unfrequent article of diet. Bread of the finest wheat flour lay on two silver baskets upon the table.

Almost the only vegetable in use among the Saxons was kalewort; and the condiments, salt and pepper. The various articles used were boiled, broiled, or baked, and were handed by the attendants upon small *spies* to the company. Prior to the introduction of forks into England, which was not till James I.'s time, our ancestors made use of Dame Nature's forks, their fingers; and for the sake of cleanliness, each person was provided with a small silver ewer containing water, and two flowered napkins of the finest linen. Their dessert consisted of grapes, figs, nuts, apples, pears, and almonds. In the tenth year of the reign of King Edward III. there was an Act of Parliament passed which ordained that no man should be served with more than two courses, except upon some great holiday therein specified, on which occasion he might be served with three.

The following bill of fare for the Court of Assistants of the Worshipful Company of Waxchandlers, in 1478, will give a good idea of the prices then charged for provisions, and make many wish for a return of the 'good old days:' 'Two loins of veal and two loins of mutton, 1s. 4d.; one loin of beef, 4d.; one dozen of pigeons

and one dozen of rabbits, 9d.; one pig and one capon, 1s.; one goose and a hundred eggs, 1s. 0½d.; one leg of mutton, 2½d.; two gallons of sack, 1s. 4d.; eight gallons of strong ale, 1s. 6d.—total 7s. 6d.: truly a most moderate bill.

Peter the Great disliked to have many attendants round him while he ate—'listening lacqueys,' he called them. He loved a dinner composed as follows: 'A soup with four cabbages in it; gruel; pig, with sour cream for sauce; cold roast meat, with pickled cucumbers or salad; lemons and lamprey; salt meat, ham, and Limburg cheese.'

Though we express surprise at the gormandising powers of our forefathers, our own elaborate public dinners are little less disgraceful than they were four hundred years ago. An eminent physician describing our present-day dinners said: 'We begin with soup, and perhaps a glass of cold punch, to be followed by a piece of turbot or a slice of salmon with lobster sauce; and while the venison or Southdown is getting ready, we toy with a piece of sweetbread, and mellow it with a bumper of Madeira. No sooner is the mutton or venison disposed of, with its never-failing accompaniments of jelly and vegetables, than we set the whole of it in a ferment with Champagne, and drown it with Hock and Sauterne. These are quickly followed by the wing and breast of a partridge or a bit of pheasant or wild-duck; and when the stomach is all on fire with excitement, we cool it for an instant with a piece of iced pudding, and then immediately lash it into a fever with undiluted alcohol in the form of Cognac or a strong liqueur; after which there comes a spoonful or so of jelly as an emollient, a morsel of ripe Stilton as a digestant, a piquant salad to whet the appetite for wine, and a glass of old Port to persuade the stomach, if it can, into quietness. All these are more leisurely succeeded by dessert with its baked meats, its fruits, and its strong drinks, to be afterwards muddled with coffee, and complicated into a rare mixture with tea, floating with the richest cream.' If there are many whose daily diet is too varied, too luxurious, there are also many who, through unkind and unpropitious circumstances, are scarcely able to supply the wherewithal to satisfy the legitimate wants of Nature. There are not a few who think themselves lucky if at the dinner hour they are able to allay the cruel pangs of hunger with a philosophic pipe.

WIRE AND WIRE PRODUCTS.

POSSIBLY but few persons realise the enormous strides made of late years by the wire industry, or the constantly increasing consumption of an article which, in one form or another, enters into almost every art and industry, and ministers directly and indirectly in no small degree to the comfort and well-being of every civilised community. Wire is no new thing; specimens of metallic shreds dating as far back as 1700 B.C. are stated to have been discovered; while a sample of wire made by the Ninevites some eight hundred years B.C. is exhibited at the Kensington Museum in London. Both Homer and Pliny allude to wire. The art of wire-drawing was not practised until the fourteenth century, or intro-

duced into this country until the seventeenth century, all wire made previously having been formed by hammering into rounded lengths narrow strips of metal cut from plates previously beaten out.

The manufacture of wire as now carried out may be briefly and concisely stated, and consists in attenuating or reducing in section thin rods of the metal under manipulation by drawing them cold through holes in a draw-plate, usually made of hard steel. The wire-drawer's bench is furnished with a horizontal cylinder, driven by steam or other power, on which the wire is wound after leaving the draw-plate. The holes in the draw-plate are arranged in decreasing diameters; and a fine wire may require some twenty or thirty drawings ere it is reduced to the size desired. Much friction is generated in the process, notwithstanding the use of lubricants; and 'annealing' is necessary to counteract the brittleness produced in the wire. Where great accuracy is requisite, the wire is drawn through rubies or other hard stones in the draw-plate. The speed of the drawing cylinder is increased as the diameter of the wire diminishes.

Much confusion has existed in regard to the gauges of wires, no fewer than fifty-five different gauges being mentioned by a recent writer, of which forty-five were for measuring and determining the sizes of wire as made and sold within the United Kingdom. The Whitworth gauge, introduced in 1857 by Sir Joseph Whitworth, and the Birmingham wire-gauge (B. W. G.) have been extensively employed. In 1884 an imperial standard wire gauge became law, and constitutes the legal gauge of this country. It ranges from half an inch to one-thousandth of an inch in diameter.

The wire industry is actively carried on in Great Britain, Germany, and Belgium, also in the United States of America, and has attained enormous dimensions. A leading continental firm has alone an output of some fifty thousand tons of wire and wire products per annum.

A few figures may here be cited to illustrate how important a part wire plays in our leading industries and manufactures. The output of coal in Great Britain alone, which may be taken at fully two hundred million tons per annum, is mainly raised by the agency of wire-ropes. The importance of carding-wire may be appreciated, from the fact that Great Britain's woollen export trade is worth twenty-seven million pounds per annum. The consumption of wire-netting is enormous; and the annual output in America and Europe of the one item of barbed wire for fencing—a comparatively new adaptation—is estimated to exceed one hundred thousand tons.

The world-wide use of wire for telegraphic and other electrical purposes is too well known to need comment, one company in America owning no fewer than six hundred and forty-eight thousand miles in their own system.

Perhaps, however, as striking a figure as can be adduced in relation to wire is its consumption in

the pinmaking industry. With but few exceptions, all pins are made from brass wire, and the daily production of pins in Great Britain is placed by competent authorities at fifty millions, of which Birmingham supplies about three-fourths. How this stupendous output is consumed affords matter of no small wonderment; and when the proverbial trifling value of each individual pin is further borne in mind, the interest in this branch of the wire industry will be still further augmented.

A point of interest to many of our readers may be noted in connecting our mention of wire with the Forth Bridge, and in pointing out that in the erection of that gigantic structure fully sixty miles of steel wire-rope were temporarily employed.

THE HAPPY LOVERS.

THEY had no 'partings in the wood,'
No 'meetings in the hawthorn lane,'
'Beside the sea' they never stood,
Nor 'watched the sunset after rain.'
Their pathway was the busy street,
Their trysting-place the Office stair,
Yet well I know joy more complete
Did never visit mortal pair.

And why should rustic love alone
Be decked with all poetic art?
These dull, gray city walls have known
The beating of a nation's heart.
The weary workers come and go;
The secret of each soul is dumb;
Yet still at times a radiant glow
Across their wayworn lives may come.

And these, my happy lovers, knew
Hard toil, small wage, and scanty fare;
The skies they saw were never blue,
But Love made gladness everywhere.
His step upon the Office floor
Was sweet to her as thrush's song;
Her face that passed the open door
For him made sunshine all day long.

And doubtless, though these two would fain
Have left awhile the city's roar
To loiter down a country lane,
Or linger by some lonely shore;
Yet sometimes Fate was kind, as when
They travelled by 'the Underground,'
And in a carriage meant for ten,
No other than themselves they found.

You laugh?—My lay is dull, I know;
Truth needs a daintier garb than this;
A gayer scene let others show,
My lovers dwell in happy bliss.
So let the world wheel on its way,
Earth holds not out a dearer crown;
God give the same to all, I pray,
Who live and die in London Town.

ON IGNORANCE.

'THERE is no darkness but ignorance,' is a profound saying of one of our profoundest thinkers. Ignorance in the mental, moral, or physical world, is the darkness wherein man thinks and works until he has gained, or been given, light that is knowledge. As a child, he tries with his infant touch everything within his reach, drawing back oftentimes with a cry of surprise and pain at what he encounters. As a man, he works towards the light, testing and trying this or that course of action—often drawing back, stung or pained; and the exclamation, 'What a fool I have been, to be sure!' is the cry of his heart or conscience.

So essential is knowledge—or, as we say, wisdom—to carry a man safe through the snares and pitfalls of life, that, as a matter of course, this wisdom has many counterfeits, pretended wisenesses, which, like false guides or incompetent pilots, themselves constitute not the least of his dangers. But for their misguidance, he might perhaps, by dint of keeping his eyes open, have floated on, with here a rub against a rock, and there a shove-off from a shoal, weathering the storm pretty successfully. Whereas, with the false pilot, Cunning, on board, lulling his watchfulness with a delusive sense of safety, or flattering his vanity into overweening self-confidence, poor Ignorance is pretty sure to become involved in the intricacies of a short-cut to wealth or wisdom, and damage or shipwreck is an incident of the voyage. And when the disaster is imminent, and wreck apparently inevitable—when the chances of saving life are at their lowest, and organised effort has nearly ceased, then Cunning finishes the work of Ignorance with the selfish cry of *saute qui peut*—each one for himself, and deuce take the hindmost; and that place he, the ignorant, the cunningly selfish, is resolved shall be, at any cost, not his. Of a friendship that will keep faith under such circumstances, will wait for, hold out a helping hand to—risk even its own chance of rescue in order to preserve a comrade

—Ignorance, and its adviser Cunning, know as little as of the lifelong if secret self-reproach which many a man, who has deserted, from whatever motive, a friend in his hour of need, carries silently with him into his grave. What a genuine thief's maxim it is, that 'Every man for himself!'—clutching always at a momentary fancied benefit to itself, no matter at whose expense, only to fall a little sooner, a little later, into the hands of the officer.

'Every man for himself,' says the phoenix financier, rising from the ruins of companies, heedless of the sobs of the women, the execrations of the men, he has helped to ruin, in their ignorance; to recall and ponder over them, perhaps, in the silent night-watches of a sleepless old age. 'Every man for himself'—it is the quintessence of smartness and wide-awakeness to the ignorant egotist hurrying to grow rich, who, without knowing it, has entered a *cul-de-sac* whence there is no egress, and where he will one day awake to find himself—as in a prison—alone.

But it is not merely this pinchbeck knowledge, this wisdom for a man's self alone, that misleads Ignorance and frustrates its own object. There is a fatal superabundance of resource, a too keen and anxious foresight, which will sometimes lend itself to defeat. In the later part of Napoleon's career, for instance, when providing, as he calculated, against every contingency that could by any possibility arise, he foresaw and calculated on everything except the stupidity of his enemies. Thus, perceiving too clearly the weak points in his plans, which his adversaries were by no means clever enough to discover, Napoleon weakened his whole design by providing against surprises which were obvious only to a general of genius equal to his own. This is precisely the mistake of many a chess-player, who is too careful to guard every avenue which he sees—but which his opponent does not see—may be attacked, to leave himself enough strength for an efficient assault.

A contrary form of ignorance is well indicated by the proverb which bids us 'Beware of "If I had wist"'—beware, that is, of the man, or woman,

who cannot look forward, who cannot weigh consequences, or perceive 'what will follow out of what,' on whose lips are perpetually the words, 'If I had only known!' Yet this conscious nescience, which cries out upon itself, is hardly so dangerous as the sublime pedantry which closes its eyes in tranquil assurance and says, 'I know'—not I think, or I imagine, or I hope, but 'I know.' The reflection that the ignorance of one age condemns that which is cried up for wisdom in the succeeding age, might tend to subdue this infatuation. But two centuries since, a lady's will—that of Lady Glanville—was disputed on the ground of her ladyship's alleged lunacy at the time it was executed, the allegation in support of her lunacy resting mainly on the fact that her Ladyship collected insects and was fond of observing their habits. Imagine, years hence, any one attempting to upset the testament of Sir John Lubbock on such grounds!

And Ignorance has been at all times but too apt to attribute wickedness to what is new to it and what it finds it difficult to understand. Many respectable people thought it wicked to travel at the rate of twenty or thirty miles an hour, when railways were first invented; it was new, it was incredible, it was 'flying in the face of a Providence that had not endowed us with wings.'

As with individuals, so with nations. The Chinese have for ages been wise for themselves only. Sixteen centuries ago they possessed a seismometer, displaying a philosophical insight into the action of earthquakes, and bearing a close resemblance to modern instruments; to-day, they close a coal-mine, and insist that it shall not be worked, lest it let loose the 'Earth-dragon,' whatever that may be. Age after age has passed in a shut-up, selfish, wise-in-their-own-conceit fashion; Celestials to themselves, to other nations the slavish victims of pagan prejudices, neither giving nor receiving the benefits of the mutual exchange of knowledge with the rest of the world. As with nations, so with individuals. An egotistical miser, living on in the house in which he was born, scraping a fortune together by the exercise of a persistent regard for his own interests alone, an ingenious reaping of small advantages, unneighbourly, niggardly, never by any chance entertaining angels unawares, because never entertaining strangers at all—this man, though a born and bred Britisher, is in his ignorance and prejudices what the heathen Chinese nation has been for centuries among the nations.

One form of ignorance, very telling upon the patience of those among whom it appears, is the ignorance displayed in conversation by one who neither knows nor cares, so long as he can hear the sound of his own most sweet voice, whether his auditors are equally satisfied with himself, with the subject on which he has chosen to dilate. He has, primarily, no idea of conversation but as a monologue. As a miser probably began to save with an object, and ends by making an object of saving, so the talker begins by talking perhaps with an idea, and ends by having no idea save talking. If your interest and attention unavoidably flag, he will pause to say, 'But perhaps I weary you?' Perhaps! And he takes your mournful 'By no means' in its entirety, and the monologue is resumed with even renewed vigour.

Pausing upon this exhibition of ignorance of, and possibly indifference to, the feelings of others, we can more readily forgive another shape of blindness made manifest in a stolid reserve. Your reserved man only vouchsafes a monosyllable in reply to any observation you may hazard. Whoever ventures on a 'duel of silence' with him will infallibly be worsted. Wrapped in his self-containing mantle, he stalks abroad among his fellows, admired by the eager and loquacious for a reticence they cannot emulate; and feared, because not understood. Should years or accident bring to light the qualifications of the taciturn man, his reticence will sometimes be found to have covered not shyness, or modesty, or prudence, or caution, but a vacuum: he has been very reserved about nothing at all; but that he found a very good covering for his ignorance, we must admit.

It is ignorance that, as we have said, is prone to attribute evil or wrong to the thing, or person, unknown to itself. Wilfred Osbaldestone's objection to his cousin was founded on the fact that he had 'a strange outlandish binding on's castor.' Hundreds entertain a dislike for a new-comer for no more solid reason, perhaps, than the cut of his whiskers. Even the very appearance of those involuntary adjuncts is said to be so obnoxious to the fine sensibilities of the undergraduates of a certain university, that they will insist on their removal from the harmless, if hirsute, face of a comrade, yea, even denude him of them with their own hands if necessary. 'I've only seen the back of his head, but I hate him;' this, though ludicrous enough from the lips of a Dundreary, is the very note, in a different disposition, of the sullen scorn of ignorance. And, start the dislike, depreciate callously and calmly, but persistently, clinch it with a nickname, and you may as well hang the dog, says the proverb most truly, to whom an ill-name has been given. 'He has a hangdog look;' no doubt he has, for he feels acutely the doubtful looks that are cast at him. How can he be frank or free in his conduct, poor brute! when suspicion gleams on him from every eye? How can he graciously and joyously wag a tail, which his conviction of the unjust scepticism with which he is regarded keeps permanently depressed?

We ventured above to take exception to the thief's maxim, 'Every man for himself;' but the wit of one and the wisdom of many—as proverbs are proverbially said to be—is nobly vindicated in a saying which the ignorant—and we are all of that class—would do well to bear in mind, 'Tout savoir c'est tout pardonner.' Ignorance would lose half its venomous quality if it could be brought to own that it does not, that it cannot by any possibility 'know all' about even its nearest neighbour, who has maybe affronted it; and that, if it could by a revelation, once arrive at that complete knowledge, a conviction of that neighbour's pardonableness must be the result.

To conclude—as there is no darkness but ignorance, so a very safe way of continuing in darkness is to declare to ourselves and others that we have got light and can see; by this means we can effectually deprive ourselves of any redundant side-lights which might have been afforded us by any more open-eyed or better spectaclled

than ourselves; and we may remain securely to the end of our days in that state of blissful ignorance which it would be folly to exchange for wisdom, according to the saying of a certain successor of Solomon.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXI.—CHECKLEY SEES A GHOST.

To Checkley, watching every evening, though not always at the same time, sooner or later the same discovery was certain to come. It happened, in fact, on Friday evening, the day after Athelstan shook hands with Mr Edmund Gray. On that night he left the office between six and seven, walked to his lodgings in Clerkenwell, made himself a cup of tea, and hurried back to Gray's Inn. Here he planted himself, as usual, close to the passage in the north-east corner of South Square, so that he could slip in on occasion and be effaced. Like many of the detective tribe, or like the ostrich, fount of many fables, he imagined himself by reason of this retreat entirely hidden from the observation of all. Of course the exact contrary was the result. The Policeman regarded him with the liveliest curiosity: the laundresses watched him daily: the newspaper vendor came every evening from the gateway to see what this ancient spy was doing, and why he lurked stealthily in the passage and looked out furtively. He was one of the little incidents or episodes which vary the daily routine of life in the Inn. Many of these occur every year: the people who come to their offices at ten and go away at five know nothing about them: the residents who leave at ten and return at six or seven or twelve know nothing about them. But the Service know: and they talk and conjecture. Here was an elderly man—nay, an old, old man, apparently eighty years of age. What did he want, coming night after night to hide himself in a passage and peer out into the Square? What, indeed? The Policeman, who had done duty in Hyde Park, could tell instructive stories from his own experience about frisky age: the laundresses remembered gentlemen for whom they had 'done,' and pranks with which those gentlemen amused themselves: but no one knew a case parallel to this. Why should an old man stand in the corner and secretly look out into the Square? He generally arrived at half-past seven, and he left his post at nine, when it was too dark to see across the Square. Then he went to the *Salutation* and enjoyed society, conversation, and a cheerful glass, as you have seen.

The time he chose was unfortunate, because Mr Edmund Gray, when he called at his Chambers, generally did so at half-past six or seven, on his way to the Hall of Science, Kentish Town. Therefore, Checkley might have gone on watching for a long time—say an æon—watching and waiting in vain. But an accident happened which rewarded him richly for all his trouble. It was on Friday. Elsie, provided by this time with a latchkey to the Chambers, arrived at Gray's Inn at six. She was going to spend

the evening with the Master. She walked in, ascended the staircase—Mr Gray had not yet arrived—opened the door, shut it behind her, and entered the room.

The hand of woman was now visible in the general improvement of the room. The windows were clean and bright: the wainscoted walls had been cleaned: the ceiling whitewashed: the carpet had been swept and the furniture dusted: there were flowers on the table: there was an easel, on which stood Elsie's fancy portrait of Mr Dering, so wonderfully like Mr Gray—a speaking likeness: books lay about the table—they were all books on the Labour Question: on the Social Question: on the Problems of the Day: all the books on all the questions with which men now torture themselves, and think thereby to advance the coming of the Kingdom of Heaven. There were new curtains, dainty curtains, of lace, hanging before the windows; and window-blinds themselves were clean and new. Elsie looked about her with a certain satisfaction: it was her own doing, the work of her own hand, because the old laundress was satisfied to sit down and look on. 'At the least,' she said, 'the poor dear man has a clean room.' Then she remembered that in a day or two she would leave him to his old solitude, and she sighed, thinking how he clung to her and leaned upon her, and already looked upon her as his successor—'a clean room,' she said, 'when I have left him. Perhaps he will leave the room, too, and be all day long what he used to be.—Sane or mad? I love him best when he is mad.'

The table was covered with manuscripts. These were part of the great work which he was about to give to the world.

Elsie had never seen the room behind this. A guilty curiosity seized her. She felt like the youngest of Bluebeard's wives. She felt the impulse: she resisted: she gave way: she opened the door and looked in.

She found a room nearly as large as the sitting-room. The windows were black with dust and soot. She opened one, and looked out upon a small green area outside, littered with paper and bottles and all kind of jetsam. The floor of the room was a couple of inches deep with dust: the chairs and the dressing-table were deep in dust. The bed was laid, but the blankets were devoured by moths: there was not a square inch left whole. It looked as if it had been brought in new and covered with sheets and blankets and so left, the room unopened, the bed untouched, for the ten years of Mr Edmund Gray's tenancy.

Between the bedroom and the sitting-room was a small dark room, containing a bath, a table for washing up, knives and forks in a basket, teacups and saucers.

'The pantry,' said Elsie, 'and the scullery, and the housemaid's closet, all together. Oh! beautiful! And to think that men live in such dens—and sleep there contentedly night after night in this lonely, ghostly old place. Horrible!' A rattling behind the wainscoting warned her that ghosts can show themselves even in the daytime. She shuddered, and retreated to the sitting-room. Here she took a book and sat by the open window, heedless of the fact that she could be seen by any one from the Square.

* Copyright 1892 in the United States of America by Harper & Brothers.

It was seven o'clock before Mr Edmund Gray arrived. 'Ah! child,' he cried tenderly, 'you are here before me. I was delayed—some business. What was it? Pshaw! I forget everything. Never mind—I am here; and before we take a cab, I want you once more to go through with me the points of my new Catechism. Now, if you are ready.'

'Quite ready, Master.'

At half-past seven Checkley arrived at his corner and took a preliminary survey of the Square. 'There he is,' said the Policeman. 'There he is again,' said two laundresses conversing on a doorstep. 'There he is as usual,' said the newspaper man. 'Now,' asked all in chorus, 'what's he want there?'

Mr Checkley looked out from his corner, saw no one in the Square, and retreated into his passage. Then he looked out again, and retreated again. If any one passed through the passage, Checkley was always walking off with great resolution in the opposite direction.

Presently, in one of his stealthy peerings, he happened to look up. Then he started—he shaded his eyes: he looked his hardest. Yes; at the open window, freely displayed, without the least attempt at concealment, he saw the head and face of Miss Elsie Arundel. There! There! What more was necessary? Edmund Gray was Athelstan Arundel, or George Austin, or both—and Elsie Arundel was an accomplice after the act. There! There! He retreated to the seclusion of the passage and rubbed his hands. This would please Sir Samuel. He should hear it that very night. This ought to please him very much, because it made things so clear at last. There she was—up-stairs, in the Chambers of Mr Edmund Gray—in the very room! There! There! There!

Perhaps he was mistaken. But his sight was very good—for distant things. In reading a newspaper he might make mistakes, because he was one of those elderly persons who enjoy their newspaper most when they can nail it upon the wall and sit down to read it from the other side of a large room. He looked up again. The setting sun shining on the window of the side where he stood—the eastern side was reflected upon the windows of No. 22—Elsie's shapely head—she had taken off her hat—was bathed in the reflected sunshine. No doubt about her at all. There she was. There! There! There! The old man was fain to take a walk up Verulam Buildings and back again, to disguise his delight at this discovery. He walked chuckling and cracking his fingers, so that those who saw him—but there are not many in Raymond's Buildings on an August evening—thought that he must be either a little mad or a little drunk or a little foolish. But nobody much regards the actions of an ancient man. It is only the respect of his grandchildren or the thought of his possessions that gives him importance. Only the strong are regarded, and an old man who looks poor gets no credit even for foolishness and silly chuckles. Then Checkley went back to his corner. Oh! what was that? He rubbed his eyes again. He turned pale: he staggered: he caught at the doorposts. What was that? He shaded his eyes and looked again—bent and trembling and shaking all

over. Said the Policeman: 'Looks as if he's going to get 'em again.' Said the laundresses: 'He looks as if he'd seen a ghost.' The newspaper boy stepped half-way across the Square. 'He's looking at Mr Edmund Gray and the young lady. Jealous—p'raps—knows the young lady—wouldn't have believed it, probly.'

Yes—Checkley was looking at that window. No doubt of that at all. He was not able to disguise his astonishment: he no longer pretended to hide himself. For he saw, sitting in the window, the young lady whom he believed to be an accomplice in the crime; and standing over her, with an expression of fatherly affection, was none other than Mr Dering himself.

Yes—Mr Dering. Most wonderful! What did it mean? Had Mr Dering resolved to clear up the mystery of Edmund Gray? Had he penetrated the Chambers and found there—not Edmund Gray—but Elsie Arundel?

'My friend,' said the Policeman, standing before him so that the view of the window was intercepted, 'you seem interested over the way.'

'I am. I am. Oh! yes. Much interested.'

'Well—don't you think you've looked at that old gentleman long enough? Perhaps he wouldn't like so much looking at. There's a young lady, too. It isn't manners to be staring at a young lady like a stuck pig.'

'No—no, Policeman—I've seen enough—thank you.'

'And, still talkin' in a friendly way, do you think Mr Edmund Gray over there would like it if he knew there was a detective or a spy watching every evening on the other side of the Square? What's the little game, guv'nor? Anything in our line? Not with that most respectable old gentleman, I do hope—though sometimes— Well—what is it? Because we can't have you goin' on as you have a been goin' on, you know.'

'Policeman'—Checkley pulled him aside and pointed to the little group at the window—'you see that old gentleman there—do you know him?'

'Certainly. Known him ever since I came to the Inn—two years ago. The people of the Inn have known him for ten years, I believe. That's Mr Edmund Gray. He's not one of the regular residents, and he hasn't got an office. Comes here now and then when he fancies the place—Mr Edmund Gray, that is. I wish all the gentlemen in the Inn were half as liberal as he is.'

'Oh! it's impossible! Say it again, Policeman. Perhaps I'm a little deaf—I'm very old, you know—a little deaf perhaps. Say it again.'

'What's the matter with the man?' For he was shaking violently, and his eyes stared. 'Of course that is Mr Edmund Gray.'

'What does the girl do with him? Why are they both there together?'

'How should I know why she calls upon him? She's a young lady, and a sweet young thing too. He's her grandfather likely.'

Checkley groaned.

'I must go somewhere and think this out,' he said. 'Excuse me, Policeman. I am an old man, and—and—I've had a bit of a shock and— Good-evening, Policeman.' He shaded his eyes again and looked up. Yes—there they

were, talking. Then Elsie rose, and he saw her putting on her hat. Then she retreated up the room. But still he stood watching.

'Not had enough yet, guv'nor?' asked the Policeman.

'Only a minute. I want to see her go out.—Yes—there they are—going out together. It is, after all— Oh! there is no mistake.'

'There is no mistake, guv'nor,' said the Policeman. 'There goes Mr Edmund Gray, and there goes that sweet young thing along of him—Ah! there's many advantages about being a gentleman. No mistake, I say, about them two.—Now, old man, you look as if you'd had a surprise. Hadn't you better go home and take a drop of something?'

It was earlier than Checkley generally went to the *Salutation*. But he delayed no longer. He tottered across the Square, showing very much of extreme feebleness, looking neither to the right nor to the left, his cheek white, his eyes rolling. The people looked after him, expecting that he would fall. But he did not. He turned into the tavern, hobbled along the passage, and sank into an armchair in the parlour.

'Good gracious, Mr Checkley,' cried the barmaid as he passed, 'whatever is the matter?'

Some of the usual company were already assembled, although it was as yet hardly eight. The money-lender was there, sitting in his corner, taking his tobacco and his grog in silence. The decayed Barrister was there, his glass of old and mild before him, reading the morning newspaper. The ex-M.P. was there. When Checkley tumbled into the room, they looked up in surprise. When he gazed about him wildly and gasped, they were astonished, for he seemed like unto one about to have a fit.

'Give me something, Robert—give me something,' he cried. 'Quick—something strong. I'll have it short. Quick—quick!'

Robert brought him a small glass of brandy, which he swallowed hastily.

'Oh! he groaned, sitting up, 'I've seen—I've seen'—

'You look as if you'd seen a ghost,' said the barmaid, who had come along with a glass of water. 'Shall I bathe your forehead?'

'No—no. I am better now—I am all right again.—Gentlemen'—he looked round the room solemnly—'I've seen this evening a good man—an old man—a great man—a rich man, gentlemen, wrecked and cast away and destroyed and ruined. With a little devil of a woman to laugh at him!'

'They don't generally laugh at the men when they are ruined,' said Mr Langhorne. 'They laugh while they are ruining them. It's fun to them. So it is to the men. Great fun it is while it lasts. I daresay the little woman won't really laugh at him. In my case'—

His case was left untold, because he stopped and buried his head in his newspaper.

Then Shylock spoke. He removed his pipe from his lips and spoke, moved, after his kind, by the mention of the words wreck and ruin, just as the vulture pricks up its feathers at the word death.

'To see a rich man wrecked and ruined, Mr Checkley, is a thing which a man may see every day. The thing is not to lose by their wreck—

to make money out of it. Rich men are always being wrecked and ruined. What else can you expect if men refuse to pay their interest and to meet their Bills? The melancholy thing—ah! the real sadness—is the ruin of a man who has trusted his fellow-creatures and got taken in for his pains. Only this morning I find that I've been let in by a swindler—a common swindler, gentlemen—who comes round and says he can't pay up—can't pay up—and I'm welcome to the sticks.—Which kind of man might your friend be, Mr Checkley, the man who's trusted his neighbour and got left—or the neighbour who's ramped the man that trusted him?'

'It isn't money at all,' Checkley replied.

'Then, sir, if it isn't money,' said the money-lender, 'I don't know why you come in frightening this honourable company out of their wits. If it isn't money, how the Devil can the gentleman be wrecked and ruined?'

For two hours Mr Checkley sat in silence, evidently not listening to what was said. Then he turned to Mr Langhorne the Barrister: 'You've known Mr Edmund Gray a long time, I believe?'

'Nine years—ten years—since he came to the Inn.'

'Always the same man, I suppose?' said Checkley. 'Never another man—not sometimes a young man—or two young men—one rather a tall young man, looks as if the world was all his—supercilious beast?'

'Never more than one man at once,' replied the Barrister with a show of forensic keenness. 'He might have been two young men rolled into one; but not to my knowledge: always the same man to look at, so far as I know—and the same man to talk with.'

'Oh! yes—yes. There's no hope left—none. He's ruined and lost and cast away and done for.'

He rose and walked out. The company looked after him and shook their heads. Then they drew their chairs a little closer, and the gap made by his departure vanished.

INFANTICIDE IN INDIA.

THE question of early marriages in India is one which has been before the public in this country a great deal of late, and in India itself it has been a question of very great moment, and has been the subject of legislation there. The discussion of this question has led to much attention being given to the position of women in India and the wrongs from which they suffer. Among these wrongs there is none more cruel than the crime of infanticide, for by that term is meant almost exclusively the destruction of female children. The writer of this paper, when in the service of the Government of India, had many instances of this crime brought to his notice, and a summary of the results he obtained is given below.

It would be wrong to suppose that this crime is prevalent in all parts or among all the people of India. Happily, it is not so, for it is only practised by the members of a few of the many castes, and chiefly among the Rajpoots, who were originally the warrior or soldier caste. How long this custom has existed cannot now be told, but there are indistinct traces of its having been

practised among the people living near the Indus, at the time of the invasion by Alexander the Great. However this may be, infanticide came almost suddenly into view in the year 1789, when Mr Jonathan Duncan was the British Resident at Benares. Mr Duncan obtained unequivocal admissions from the natives themselves as to the existence of the crime among them; but they did not admit the offence to be a very heinous one: their palliation for it then was the same that is offered now—namely, the intense pride of caste which prevents them from marrying their daughters to the sons of any tribe lower than their own. Among the Rajpoots is a sub-tribe called the 'Chohans,' and it is amongst them that the destruction of female offspring exists in the most marked way. If a Rajpoot did allow his daughter to grow up, he would be obliged to marry her before she came to the age of puberty, and to give with her a very handsome dowry; while, on the other hand, if it was a son, he could hope that he would live to get married and would bring a dowry to him.

Although a Rajpoot speaks of infanticide as only a venial offence, he does not claim any religious sanction for it: he knows, on the contrary, that his sacred books condemn the practice, as, for instance, it is mentioned in the *Brahma vaivartta Purana* that to kill a female is as criminal as to kill a Brahman, and one guilty of such is to suffer in *narka* or hell. The Rajpoots also admit that the crime is against all natural affection, and it is also known to be a terrible trial to the mothers to have their infant girls destroyed. Indeed, the harder task is assigned to the mother of not only giving an unwilling consent, but also that of aiding in the commission of the crime. Some of the wealthier Rajpoots in the North-west Provinces of India live in houses surrounded by a walled enclosure. This isolation from the nearest villages and neighbours has rendered the crime easier of concealment. Mr Charles Raikes in his *Notes on the North-west Provinces* has the following: 'At Mynpoorie there is an old fortress which looks far over the valley of the Eesun river. This has been for centuries the stronghold of the Rajahs of Mynpoorie—Chohans, whose ancient blood descending from the great Pirthee Raj and the regal stem of Neem Rana represents the *crème de la crème* of Rajpoot aristocracy. Here, when a son, grandson, or nephew was born to the reigning chief, the event was announced to the neighbouring city by the loud discharge of wall-pieces and matchlocks; but centuries had passed away and no infant daughter had been known to smile within these walls.' Mr Raikes gives the following supplement to his story, to show how the Government approved of the conduct of the Rajah who first preserved a female child: 'In 1845, thanks to the vigilance of Mr Unwin—a magistrate of the district who had exerted himself to put down infanticide—a little grand-daughter was preserved by the Rajah of that day. The fact was duly notified to the Government, and a letter of congratulation and a dress of honour were despatched from headquarters to the Rajah.'

Although the attention of judicial and police officers has been directed to this crime for many years, but little is known as yet as to the mode by which it is committed. It is not difficult

in any case to sever the bond to life in a new-born babe. As a Rajpoot, who was favourable to the cessation of infanticide among his clan, said, when pressed for an answer as to how the female children were killed: 'What is easier to destroy than the blossom of a flower.' It is believed that in the greater number of cases the child is left to die from want of nourishment; in many others, the death is effected by suffocation, and in a small number by poison.

Infanticide is diminishing because of the activity with which the suppression of it is pursued, and for the same reason the cases that escape judicial inquiry are now fewer. It is only with those into which an inquiry is made that any knowledge whatever can be arrived at as to how the death was accomplished. A part of the judicial inquiry may include a post-mortem examination by a medical officer, and as a result of this there may be a reference to a chemical expert, if there should be a suspicion of poison having been used. Of these cases, I am in a position to say that between the years 1873 and 1888, both years inclusive, two hundred and twenty-three cases of infanticide by poison were referred to me from the North-west Provinces and Oudh alone, and the result of my inquiries was to show that poison was detected in thirty-six of them. The poison detected was opium in thirty-four, and arsenic in two of them. In one of the latter, the poison had been administered with great clumsiness, as gritty particles of white arsenic were found adherent to the highly inflamed mucous membrane of the infant's stomach.

The number of cases in which opium was found gives a percentage of fifteen of all the cases referred. These numbers testify that poison is one of the modes of infanticide, and they also bring out that when it has been determined to kill by poison, opium is employed. The Rajpoots, then, had acquired this knowledge about opium, that it is out of all proportion more fatal to very young children than it is to adults. I need hardly add that all medical men know this fact very well. Concerning the administration of this drug for the purpose of infanticide, it is said there are two methods used, both of which exhibit a ruthless kind of skill: the one method is to smear the drug over the nipple of the mother, so that the child will imbibe the poison along with its mother's milk; the other is to spread on the roof of the child's mouth a little opium and allow it gradually to be dissolved and swallowed. This latter is probably the most frequent method employed.

No sooner was it discovered that infanticide was practised among the Rajpoots, than a means of suppressing it was sought for. Mr Jonathan Duncan, only a few months after his discovery, persuaded the Rajpoots around Benares, who were under British rule, to enter into a covenant by which they engaged themselves to abolish the crime. This, however, turned out a failure; for the crime was still rampant in the same part of the country in 1816; and the magistrates then stationed there—Messrs Fortescue, Smith, Shakespeare, and others—reported to the Governor-general of the day that infanticide still existed.

Mr Duncan, from being Resident at Benares, had been promoted to be Governor of Bombay,

and there he soon stirred up inquiries on the subject of infanticide, and the result was to find it was largely practised in Gujerat, Katch, and Kattiawar, among a tribe called the 'Jadelas,' who are nearly identical with the Rajpoots. In 1807, Major Alexander Walker was commissioned to make an extensive inquiry embracing the countries named above; and this officer did much to bring about a better state of things. In Northern India little was apparently done till the year 1841, when Mr Robert Montgomery (afterwards Sir Robert Montgomery, Lieutenant-governor of the Punjab), then magistrate of Allahabad, made a vigorous crusade against infanticide. He established the system, which, with modifications, is that which is still used for its suppression. His efforts were followed up by those of an officer already mentioned, Mr Unwin, the magistrate of Mynpoorie, who instituted a system of inspection in the villages of the district in which Chohan Rajpoots dwelt. This consisted in the village watchmen being called on to report the birth of a female child to the police, who, in turn, had to report to the magistrate. An order was then issued that one month afterwards the health of this child was to be again reported on; and if it became ill, it was to be seen by a police officer, who again reports; and if it died under suspicious circumstances, a post-mortem examination must be made by the civil surgeon of the district. The effect of this system of inspection was that in six years after its institution there were one thousand two hundred and sixty-three girls of six years and under living in the Chohan villages of the Mynpoorie District; while at the beginning of those six years there were none at all. In other words, at the end of 1843 there were no girls in those villages of Chohan parents; in May 1851 there were over twelve hundred of them. This statement gives some idea of the destruction of life that would have taken place had this able magistrate not interfered in the way he did.

The means taken to suppress female infanticide in later years are similar to those instituted by Mr Unwin. Since 1870, these measures have had the authority of a special Act of the Legislative Council of India, the Female Infanticide Act being Act VIII. of that year. This enactment was chiefly for use in the North-west Provinces. It gives power to the local Government to proclaim villages where the crime is known to be practised; and to entertain police in excess of the ordinary establishment, for the detection and prevention of the crime; and to keep registers of births, deaths, and marriages, or to take a census of suspected classes and persons, as well as other minor regulations. The working of the Act during the last twenty years has been attended with a great decrease of the crime, as may be seen from the following: In the Administration Reform of the North-west Provinces for 1881-82, the number of proclaimed villages was 2368; in the Report for 1883-84 it is said that the practice had been suppressed to a considerable extent, and was then confined to a very few families: in the Report for 1886-87 the crime was stated to be getting still rarer, and the number of proclaimed villages had gone down to 1573. It is also remarked that the custom of the father of the bride receiving a sum of money from the bride-

groom had been adopted, and was increasing. This in itself tends to diminish the temptation to infanticide. In the Report for 1887-88, it is said that the proclaimed villages were 1381, nearly two hundred fewer than in the previous year. It is also remarked that the alteration in the marriage custom just mentioned was at work, and producing favourable results, the crime still decreasing, so that hopes are entertained that it will soon disappear.

THE MAYOR OF SAWMILL FLAT.

CHAPTER II.—CONCLUSION.

THE reader doubtless inferred, when he discovered an Englishman of talent and refinement in the wildest frontier Territory of the United States, that such a man had his own good reasons for being there. The inference was a correct one. John Lee was a man with a history—an unpleasant history—and he went to South-western Arizona to begin life over again, and to 'grow up with the country.' The day after the town meeting, the remarks of the new settler anent jail-birds and the subsequent confusion of Dr Lee furnished the topic of conversation throughout the settlement. At the noon hour several miners and others gathered, as was their wont, in front of Andy Dunbar's store. Jim Hawkins, whose faith in Lee was still unshaken, was there and bore as long as he could the generally unkind remarks which fell upon his ear.

'Boys,' he said at last, 'you don't give the Doctor a fair shake. You've knowed Doc. Lee longer a good deal than you've knowed this feller Cadwell, and yet just because Cadwell gets up and makes some dirty remarks which ain't proven, not by a jugful, you jump on the Doctor with both feet. Wait and see what Lee has to say for himself. I'll just bet any of you lads an even thousand that Cadwell is a liar, and will crawl down from his perch. Here's the cash—who wants to cover it? Put up or shut up!'

The men felt somewhat ashamed of themselves, and no one cared to accept Hawkins' bet. The old man continued: 'There's just one thing I'll promise you, boys. If Cadwell can't or won't prove his words, Jim Hawkins is a-going to lick him clear out of Arizona. Yes, sir, that's what I'm a-going to do, Reeve or no Reeve; and if the Justice wants to have me arrested for assault, I'll pay a good round fine with pleasure.'

Jim Hawkins' blood was hot and his fingers tingled. He was an old Westerner, and had lived most of his life in communities where law and order were only theories. But the old Anglo-Saxon comes strongly to the surface in Western men, and his love of fair-play was as keen as his hatred for a slanderer or a coward. He felt that he could not wait a week to thrash Cadwell, so on his way home he stopped at John Lee's shanty. The Doctor was busy writing in the room that he called his surgery. There was a blank dull look upon his face, which did not brighten as usual at the sight of his friend, and neither of the two offered any greeting to the other.

'Doc,' said Hawkins shortly and excitedly, 'was you ever in jail?'

'Yes, Hawkins, I was.'

Those words cost John Lee his best friend, just when he needed him the most. If he had only qualified his reply, or if Hawkins had pursued his inquiry a little further with a view to learning particulars, the result would have been different. But no more words were spoken; and Jim Hawkins, shocked and disappointed, walked away to his mill with a faltering step. For if there was in Sawmill Flat that day a man with a heavier heart than John Lee carried, that man was honest Jim Hawkins.

That same night John Lee lay down as usual upon his rather hard couch, but he could not sleep. He lay awake, ruminating upon the mysterious ways of Providence and of mankind. He had never in his whole life done aught of which he need be ashamed; and yet he had been incarcerated for weeks in a prison, had been put upon his trial for murder, and acquitted only because of a persistent disagreement in three different juries which had been impanelled to try him. He had left his native land with the dark shadow of suspicion resting upon him—a shadow which he and his many friends were utterly powerless to dispel. Despairing of ever regaining his old standing in any English community, John Lee, hoping against hope that he might be justified in the sight of his fellow-men before death should claim him, emigrated to the Western world, and took up his abode upon the frontier of civilisation. And as he lay upon his sleepless bed, he could not but think how very small, after all, the world is. For he had travelled six thousand miles to escape the sneers and black looks of those who had mistrusted him, only, when Time was beginning to heal his wound, to find himself confronted by one of the men who verily believed him guilty of a foul crime.

Lee had seen this man Cadwell several times during the six months' residence of the latter at Sawmill Flat; and yet, although something about the man had always seemed familiar to him, he had, strangely enough, never made Darius Cadwell's acquaintance. But when, at the town meeting, the man arose and in hard tones utterly void of feeling asked the assemblage if they wished to elect a jail-bird or a murderer for their Mayor, Lee in a moment recognised him as a member of one of the juries that had tried him at the York Assizes.

Far into the night the doctor lay thinking upon the cruelty of his fate. It was two o'clock perhaps when he fell into a troubled doze, only to be awakened by a hammering upon the door of his shanty. He started up but half awake, and went to the entrance, almost expecting to see the cold-blooded jurymen.

'What now?' he asked, loudly and roughly for John Lee.

The door was now open, and by the moonlight could be seen a man, haggard and weary and covered with dust. In the left hand he held the rein of a saddle horse, and Lee could see that both horse and rider had travelled a long distance.

'Air you Doc. Lee?'

'I am.'

'I'm from Rosario, near the Mexican line. It's seventy miles from here. We've got the yellow fever—got it bad. The town's picketed, and I'm the last man out. We only had one doctor, and he died 'tending the first case. We heered you doctored yellow fever in Louisiany, two years ago. Is that right?'

'Yes, it is. I have seen a good deal of yellow fever.'

'Will you come down to our town and help us out, Doc.?' The man gasped his request as if he dreaded a negative reply. He was a rough specimen, but he realised that he spoke for dying men and women.

'Yes, I will—right off,' replied Lee, as he commenced to dress himself. 'How many cases when you left—and when did you leave?'

'Thirty cases and eight deaths already, boss. I left at four o'clock yesterday afternoon. Been riding ever since, and my mare's clean tuckered out.'

'Well, you just take a wash and then lie down for half an hour. Here is water and a towel. I've got a couple of good ponies out here at the back. I'll bring them round while you rest.'

Lee was wide awake by this time, and his professional interest was aroused. He had plenty to think of now besides his own troubles, and that suited John Lee. He set all that his modest larder contained before the tired messenger, and gave him a glass of whisky-and-water.

'Do you feel like doubling?' Lee asked the man half an hour after his arrival.

'You bet I do, Doc. I'm made over, and I'm good for a hundred miles.—By the Lord, Doctor, you're the stuff, you are. I suppose you know, sir, that once you're in Rosario you can't get out?'

'Come on; never mind that. Let's start.'

Both men stepped outside where the ponies were waiting. Lee locked the door, and with a piece of chalk wrote upon it: 'Gone to Rosario—Yellow Fever.' Then they leaped into their saddles and cantered away.

The settlement or town of Rosario was a much larger place than Sawmill Flat, although the settlers were by no means so prosperous as those at the Flat. Rosario was now visited by that fearful scourge from which none of Uncle Sam's territory bordering on the Gulf and the Mexican line is altogether exempt. The terrible summer climate, the morasses and swamps, and the bad drinking-water, all lend their aid to the plague itself, which, when it once breaks out, flees before nothing but the winter frosts.

It was noon when Lee and his companion reached the 'dead' line of pickets, posted for quarantine purposes around the afflicted place by the people of the adjacent districts, and there the physician parted with his guide.

Lee was not at all fearful. He had himself suffered from the 'yellow jack' in a mild form; and he had afterwards been one of the most active and successful doctors when the scourge had visited New Orleans two years before. Of course he incurred some risks, but not so many as those who had never been attacked by the disease, or who knew nothing of the correct method for treating it.

He was a welcome arrival in that miserable community of dead and dying, and he plunged right into his work. Before dark he had visited every case, and had enrolled a corps of assistants to nurse the sick and to enforce the rules which he drew up to minimise the spread of the plague. By nightfall, too, he had forgotten for the time being his personal troubles and the existence of Darius Cadwell.

Besides Jim Hawkins, whose good-will he had now lost, John Lee had at least one other staunch friend in Sawmill Flat. This was none other than Jennie Dunbar, the belle of the settlement, and only child of the wealthy storekeeper and trader, Andy Dunbar. Perchance she loved the handsome and interesting Doctor; at all events, she much admired him, and, with a woman's instinct, believed that he was innocent of any such fearful crime as had been indirectly charged to him by Cadwell. Her acquaintance with Lee was very slight and superficial. Of course, in so limited a community they had met often; but Lee, for good reasons, which he had partially explained to Hawkins, had steadily and consistently refrained from paying any particular attention to the girl, who was very handsome, and, though spoiled by her father, possessed of much good common-sense. Now, this girl of twenty years knew well the value and good moral effect of an expression of sympathy and confidence; and she judged rightly that such an expression from herself to Dr Lee at this time would have an immense influence with 'the boys' of Sawmill Flat, who one and all admired the girl and esteemed her father.

Upon ordinary occasions, Jennie would have been the last to make any overtures to Lee or any other man for a closer acquaintance, but the present was not an ordinary occasion. Her father had just bought her a spirited horse, and on the very day of the town meeting a spick and span new buggy had arrived from St Louis. She resolved to make this an excuse for inviting Lee to drive with her, knowing that if they two were seen riding together it would be a tacit but unmistakable intimation that she believed in Lee and counted him her friend. So, immediately after breakfast, on the morning that John Lee was riding hard and fast to fever-stricken Rosario, Jennie Dunbar drove out to the Doctor's shanty, and was the first to read the notice written in chalk upon the door.

The girl was not only surprised and disappointed; she was thunderstruck. She sat down upon the bench where the Doctor often smoked his pipe, and remained there some moments lost in thought. Then she looked at her watch. It was just seven o'clock. She sprang into the buggy and drove to her father's house, which she entered. In ten minutes she came out again with a small bundle in her hand, and behind her she had left a note for her father and mother. The bundle contained one cotton dress and a change of underwear. The note ran as follows:

DEAR FATHER AND MOTHER—I have gone to Rosario to nurse the yellow-fever cases. I knew it was no use to ask your permission. But do not be angry; I want to do something useful. I feel sure that I shall come back soon and well; so don't worry.

JENNIE.

That night, Jennie Dunbar left her new horse and buggy with one of the quarantine guards, and passed through the dead line into Rosario to report at Dr Lee's headquarters as a volunteer nurse.

Jennie Dunbar was an impulsive girl; and as is the case with most young women of a similar nature, her impulses were usually good. Do not let it be supposed for a moment that her sudden trip to Rosario was a foolish escapade, nor yet merely a girl's tribute of love to the man who had well-nigh—if not quite—won her heart. She had longed over and over for such an opportunity as this; for Jennie Dunbar was not the sort of a girl to remain contentedly the spoiled favourite of a small frontier settlement. She wanted work, and work of a nature wherein she could display her sound judgment and her fearless spirit. Such work was now before her.

Lee shook hands with the girl, and cordially welcomed her. He was not an effusive man, but he was just as glad to see the familiar face of a woman whom he knew he might fully trust with his most critical cases.

'Your father and mother know of your coming of course?' remarked Lee.

'Yes,' replied the girl—which she believed, rightly, to be true enough by that time.

'Well, you take a rest, and I will assign you to work at daylight,' he said; adding, as he looked at his watch, 'it is now ten o'clock.'

It is not necessary here to detail the hard and weary life, full of both discouragement and cheer, which the Doctor and his nurses led during the next few weeks in that pest-smitten town. At first the number of patients increased steadily, and, notwithstanding all the efforts of Lee, each day found Death reaping a rich harvest. But in three weeks the climax was reached and the fresh cases became fewer.

When October arrived, the worn-out watchers at Rosario began to look eagerly for the first night-frost of autumn, however slight; for frost and yellow fever never dwell together.

During the long weeks the Doctor had become acquainted with well-nigh every man, woman, and child in Rosario; but there was one man who had carefully avoided Lee. This was an Englishman, who was taken down with the fever on the 1st day of October, and in forty-eight hours he was a doomed man. His tongue was swollen badly, but he managed to ask the Doctor how long he might expect to live.

'The chances are, my poor fellow, that you will have exactly twenty-four hours of life. Is there anything you wish done—any message to send to any one?'

'Yes, Doctor, I've got a message for the whole world, but most of all for you. Can't you guess who I am?'

A curious gleam played upon John Lee's face, and mingled feelings crowded his bosom as the truth dawned upon him. 'Good God!' he exclaimed. 'Yes, you are—you are Richard Dent!'

The dying man nodded assent. After a pause, in which to gain strength, the doomed victim asked: 'Did you ever suspect—er—er—anything, Doctor?'

'Suspect? Suspect? Why, Dent—I know

beyond the shadow of a doubt that you murdered the father of my betrothed bride.'

Again the man nodded. 'Yes, that's right. I didn't mean to, but I did, and I let you shoulder it all. I wasn't man enough to toe the mark and let you out, Doctor. You came mighty near—yes, you did—mighty near swinging for it. But I'll pay it all up pretty soon, Doc. Twenty-four hours you said, that's all.'

There was another pause, during which Lee gave Dent some medicine to relieve him a little.

'Why don't you tell the boys, Doctor? There's time to hang me yet. Those fellows would hang me or burn me, or a dozen like me, if you only say the word. There's time enough—twenty-four hours.'

'Bah!' replied Lee. 'I wouldn't hurt you. You've probably paid a big price already. Don't think about me, Dent: a dying man should make his peace with God—not with men.'

'There ain't a notary or a magistrate you could get, is there? I could make a—you know—yes, a deposition.'

'No; there's no one, and if there was one, I wouldn't bother. I must leave you for a while; but I will return soon. Your nurse is on the veranda.'

When John Lee left, by the front door, the house in which Richard Dent lay dying, Jennie Dunbar, who, unseen, had heard all, ran out at the back. As fast as she could go, she hastened to the picket line, which she reached at a spot where mounted messengers waited to do errands for the imprisoned people of Rosario.

'Two of you,' she said, quietly but quickly, 'start at once for Sawmill Flat. One of you find Jim Hawkins, and the other look for Darius Cadwell. Tell them that I, Jennie Dunbar, and Dr Lee both demand their presence on a matter of more than life and death. The yellow fever is not to stop them. Hurry, for God's sake, men! One thousand dollars apiece if you bring them here within twelve hours; and one hundred dollars extra for every hour saved from twelve. You know me—you know the Doctor: our promise is good.'

Before the last word was spoken, the two men were in the saddle galloping toward Sawmill Flat, and Jennie Dunbar began to count the minutes until their return. She had not intended to deceive them when she gave her order in Lee's name: she only did it to add weight, for scarcely a man in Rosario but would have deemed it an honour to make some sacrifice for the brave physician who had served them so well.

It was eight o'clock in the evening when the two messengers departed from Rosario: at five o'clock in the morning they were back with Hawkins and Cadwell—the former of whom had come willingly enough; the latter after some demur.

The anxious girl was waiting for them, and at once conducted them to the cottage where Richard Dent, in all the throes of the last stages of the fever, awaited his rapidly approaching end. They were none too soon, for the power of speech had already left him, and delirium would speedily set in.

Lee, who was in the room, was much surprised

when Hawkins and the others entered, and would have ordered them out. But Hawkins had been advised of what was necessary by Jennie.

'Excuse my rudeness, Doc,' he said; 'but I am here by virtue of my magisterial commission received from the Governor of Arizona.—Now, Cadwell, you ask questions of this poor cuss. I will listen.'

Cadwell at once began. 'Do you know anything of the murder of old Squire Bowes of Leyburndale, Yorkshire?'

Dent nodded.

'Did this man, Dr Lee, have aught to do with it?'

A shake of the head was Dent's reply.

'Do you know who did commit that murder?'

Again Dent nodded affirmatively.

'Can you tell us who did?'

The dying man nodded once more and feebly pointed his forefinger at himself.

'And your name is Richard Dent?'

Another nod.

'That will do, Cadwell,' said Hawkins, who now stood over Dent.—'Doctor, hold up the sick man's hand.'

Lee complied.

'Now, then,' said Hawkins, 'you solemnly swear that the murder of one Bowes at Leyburndale, Yorkshire, England, was committed by you, Richard Dent; and that John Lee was not a party to the act in any way, shape, or manner? That is the truth, so help you God?'

For the last time Dent nodded assent, and then all but the Doctor left the room.

Richard Dent was the last victim of the yellow fever at Rosario; but the quarantine was not removed for some weeks, during which time all the Sawmill Flat people were compelled to remain within the prescribed limits. Even when the dead line was wiped away, only Jim Hawkins and Jennie Dunbar returned to the Flat.

John Lee, worn out with his labours, went up into the mountains of Colorado to recuperate; while Darius Cadwell, after making an elaborate statement in writing, which he signed before a notary, decided that he might find elsewhere a more comfortable residence than his shanty at Sawmill Flat.

On the 1st day of January, John Lee was still at Denver, and there, about a week later, a letter from Jim Hawkins found him. The following is the letter, with all grammatical errors eliminated:

CITY OF SAWMILL FLAT, ARIZONA TERRITORY,
Jan'y 1st, 1889.

DEAR FRIEND—We have just held our election for Mayor. The boys nominated you, and we polled a full vote. You are elected by acclamation. Hurrah! How soon can you come and take hold of the City? All the boys send their regards.—Your friend,
JIM HAWKINS.

Mayor Lee replied in person, for he at once went down to 'take hold.'

Whether or not the City of Sawmill Flat will ever attain the success anticipated by its progenitors is as yet an unsolved problem. But Dr John Lee is still its honoured Mayor, and he will without doubt do his best for his friends

and neighbours; while, if there is one person who approaches him in popularity it is his wife, who bears a striking resemblance to Jennie Dunbar.

RATS ON SHIPBOARD.

It was a very great while before the mariner came to realise that among the perils which beset his calling he must reckon the existence of rats on shipboard as by no means an insignificant one. That sailors have for centuries viewed the vermin with a superstitious eye is evident upon the testimony of many old writers. Shakespeare, in the *Tempest*, says:

A very carcass of a boat,
Nor tackle, nor mast—the very rats
Instinctively had quit it.

The reputation of the rat as an evil omen, therefore, is beyond question very ancient; but as a pest whose presence is a menace to the safety of life at sea the animal has earned a distinction which is quite modern. A most remarkable instance of the mischief which the creature is capable of doing came to light during the proceedings of a Naval Court of Inquiry held in August 1875 for the purpose of investigating the cause of the loss of the barque *Commodore*, of Hartlepool. The vessel, which was burnt at sea, had been loaded with a cargo of timber, and the fire broke out in the hold in a most mysterious manner. It was eventually proved, on the evidence of the entire crew, that beyond a shadow of doubt the outbreak was originated by a rat carrying off a lighted candle, which had stood in the fore-castle, and was presently missed by the sailors, and dropping it among the dry and resinous pine stowed below. The *Shipping Gazette*, in commenting upon this extraordinary case at the time, and speaking of the danger generally of rats on shipboard, said that 'they have caused the foundering of many ships by gnawing holes in the planking, or so eating away the inner sides of the wood as to leave very little for the straining of the hull to do in completing the aperture; they have been known to nibble the timber at the waterways until the wood was so thin as to admit rain-water through it; they will attack the bungs of casks and create leakage; find out the soft parts of the knees or lining, and make a passage for themselves from one part to another.' So fully has the danger of this now come to be recognised, that such contingencies are generally provided for in the insurance of wooden-built ships.

As one pair of rats will produce three or four dozen young ones in the course of a twelvemonth, it may easily be conceived that a sailing-vessel, loaded with a cargo likely to prove particularly attractive to the rodent quadrupeds, by the time she returns from an ambling voyage around the world must be literally infested with the creatures. Various are the means of extermination employed. The owners of the big lines of steamships find it necessary to engage a regular rat-catcher; and on the return of each vessel, as soon as the freight has been discharged, he sets to work with all the science of his calling to remedy the nuisance. In a passage across the Atlantic and back again, occupying barely a

month, it is commonly found that the rats have increased so prodigiously, notwithstanding the ship sailed with an apparently clear hold, as to require a good-sized cart to remove the carcasses when the professional gentleman has made an end of his work. The common plan in use among shipmasters who do not aspire to the dignity of employing a regular rat-catcher is to smoke the animals out of the hold. Dana, in his admirable *Two Years before the Mast*, gives a good account of the manner in which this is done. He says: 'As the next day was Sunday, and a good day for smoking the ship, we cleared everything out of the cabin and fore-castle, made a slow fire of charcoal, birch bark, brimstone, and other materials on the ballast in the bottom of the hold, calked up the hatches and every open seam, and pasted over the cracks of the windows and the slides of the scuttle and companion-way. Wherever smoke was seen coming out, we calked and pasted, and, so far as we could, made the ship smoke-tight. The captain and officers slept under the awning which was spread over the quarter-deck; and we stowed ourselves away under an old studding-sail, which we drew over one side of the fore-castle. The next morning, we took the battens from the hatches and opened the ship. A few stifled rats were found: and what bugs, cockroaches, fleas, and other vermin there might have been on board, must have unrove their life-lines before the hatches were opened.'

It has frequently happened that ship-captains, finding their vessels whilst at sea overrun with rats to such a degree as to be a serious inconvenience, have attempted to deal with the nuisance by scattering poisons in the hold. The remedy has of course proved effectual, but in the end, far worse than the disorder; for the creatures, perishing at the bottom of the ship, naturally begin to decompose after being dead a little while, and then the vessel is haunted by a most villainous odour. Imagine a craft becalmed for days under a broiling equatorial sun, with hundreds of rats decaying among the inaccessible nooks and crannies of her hold! The origin of more than one marine pestilence might doubtless be traced to this cause.

Sailors have a novel rat-trap, which, we believe, was devised in the first instance by an old Jack as an amusement for the rest of the fore-castle. Its great charm is its perfect simplicity. An inverted box is placed upon the deck, one end of which is tilted upon a short stick that balances it, and attached to which is a piece of twine, leading into the hand of a seaman who lies stirless in his hammock with his eyes cautiously peering over the rim of it. Under the box are dropped a few crumbs of biscuit or a small cube of salt junk. Presently the rats in the forepeak beneath, finding all still overhead, venture up through the interstices between the timbers. The sight of their sharp snouts and small bright eyes is as cheering to the expectant sailor as the bob of the float is to an angler. By-and-by one of them spies the bait, and makes for it, when jerk goes the string, down comes the box, and the animal is imprisoned.

A writer in the *Nautical Magazine* tells a story of how a Yankee skipper contrived to free his ship from rats. Whilst he lay in port, he

discovered that one of the British ships then in the harbour had amongst her cargo a great quantity of cheese. He thereupon found an excuse for hauling over to her and mooring his own packet alongside. The next step was to procure a plank, smear it well with an odiferous preparation of red herrings, and place it so as to lead through one of the ports on board the Englishman. The immediate result was a wholesale emigration of the rats from the American ship's hold to the cheese-laden vessel alongside.

The sagacity of the rat is not perhaps to be equalled by that of any other animal, the dog alone excepted. Their instinct in quitting a sinking ship is remarkable. Nor do they always rush up just as the vessel is settling down and leap blindly overboard in the manner generally supposed. Some years ago a ship whilst lying secured to a quay was run into and stove by another vessel. She was sinking rapidly, when a long trail of rats were observed very cautiously creeping along the hawsers which connected her with the wharf, and scampering away as hard as they could pelt for the shelter of a friendly warehouse the moment they touched the land. There is even more talent shown in this procedure than in the monkeys' manner of bridging a river.

The sea-going rat occasionally exhibits an extraordinary and most perilous desire to get at water. Some little while since, a vessel, then almost new, began to leak so seriously that she had to be docked before she could proceed on her voyage. It cost the shipwrights a long search to discover the weak spot; but at last they found that right aft, in the bilge, the rats had gnawed clean through the planking; and nothing kept the water from rushing in save the thin sheets of metal with which the vessel was sheathed. The leak was repaired and the ship sailed; but after a short time she began to make water again rapidly, leaving no doubt that the rats were still the cause of the mischief. Upon this the captain, wisely imagining that it must be thirst which drove the creatures to this expedient of nibbling away the timber, ordered a daily allowance of water to be placed for them upon the hatch-coamings in the 'tween-decks. This they were not very long in discovering; 'and never again,' concludes the captain, in telling the story, 'during all the while that I remained in the ship and carried out this plan were we troubled with any more leaks.'

All of us must recollect the story of the shipwright in the *Uncommercial Traveller* who bartered his soul to the devil for an iron pot, a bushel of tenpenny nails, half a ton of copper, and a rat that could speak; and how this rat was incessantly signifying the fact by repeating the melancholy refrain:

A lemon has pips,
And a yard has ships,
And I'll have chips!

"What are you doing, Chips?" said the rat that could speak.—"I'm putting in new planks where you and your gang have eaten old away," said Chips.—"But we'll eat them too," said the rat that could speak; "and we'll let in the water, and we'll drown the crew, and we'll eat them too." Chips, being only a shipwright, and

not a man-of-war's man, said: "You are welcome to it!"

It is perhaps a pity, seeing that the animals swarm to such a degree on board every variety of vessel, that some means of utilising them could not be devised. The first idea to naturally follow this reflection is, why not *eat* them? Let not the epicure shudder at the suggestion: one and all who, whether by necessity or curiosity, have partaken of the rat declare it to be by no means such an unsavoury morsel. The flesh when cooked is about the colour of a pigeon's, and of a flavour that combines with the tenderness and succulence of the rabbit the higher and more matured qualities of the hare. The famous Sir Sidney Smith entertained a high opinion of the delicacy of rats. 'He asserted,' says Lieutenant Parsons in his entertaining *Nelsonian Reminiscences*, 'that rats fed cleaner and were better eating than pigs or ducks; and agreeably to his wish, a dish of these beautiful vermin was caught daily with fish-hooks, well baited, in the provision hold, for the ship was infested with them, and served up at the captain's table. The sight of them alone took off the keen edge of my appetite.' No doubt, the feeling of disgust which exists against the idea of employing the rat for gastronomic purposes is largely due to the want of discrimination which the creature shows in its own feeding. It will devour with equal avidity human flesh or decayed vegetable matter; whilst its known predilection in favour of the sewers is enough to nauseate the most unscrupulous appetite. But it may at least be urged that whilst the rat is on shipboard it is free from the contamination of the drain-pipe; and as to its indelicacy of feeding, it cannot surely be worse or more debauched in its taste than the hog or the duck, or a great many other animals which are reckoned very choice eating indeed. Different nations have different palates, and amongst the Chinese and other eastern races the rat is considered so much of a dainty that it is no uncommon circumstance for a vessel entering one of the ports of the Celestial Empire to be boarded by a party of natives who come to offer money for permission to hunt the ship in search of the animals. During the siege of Paris, rats were consumed in prodigious quantities, and one of the luxuries of that dreadful time was a rat-pie made with mushrooms.

The rat on board ship, as elsewhere, has a disagreeable trick of getting into the most untoward places. Herman Melville in one of his books describes how, after he had long been eating molasses from a certain jar, he discovered a rat lying smothered in the stuff; whilst one of the commonest things possible is to find the creature drowned in the scuttle-butt which holds the fresh water, or hopelessly wedged into a tierce of beef that is opened to replenish the harness-cask. A case was quite recently reported by one of the shipping papers in which the water-tanks of a vessel newly arrived from the antipodes, on being emptied and cleared out, were found to contain the skeletons of many dozens of the creatures, so that the crew were startled by the discovery that for the whole voyage home their water had been tainted with an infusion of rats. Yet the health of all on board had been wonderfully good during the passage, nor had the least disagreeable

taint been apparent in the water beyond the flavour of the brine used to preserve it. Such is the effect of the imagination upon the bodily health, that had the crew *known* they were drinking from a cistern full of dead rats, the flavour of the water would have been found most repugnant, and possibly a good deal of sickness would have been reported upon the ship's arrival.

The seafaring rat is not as a rule of such a ferocious disposition as his brother rodent of the sewers. Sailors when on long and tedious voyages, such as a whaling cruise, will often make pets of them, training them to come up out of the hold at certain hours to be fed. We knew of one old sailor who used regularly to sleep with a rat in the clews of his hammock, till one night he was rudely awakened by being precipitated to the deck. He at first imagined his shipmates had been playing a very common fore-castle prank upon him; but he discovered, on examining the lanyard which had suspended his hammock, that the sharp teeth of his favourite rat had gnawed right through it. This was the occasion of a little coolness between them.

Many are the stories of rats on board ship which might be told were there space; but one more must now suffice. A vessel lying moored in the river Hooghly neglected the usual precaution of unbending sails, and kept her canvas furled upon the yards. She stayed at Calcutta for about a fortnight. When she was ready to get under way, sail was of course made; but imagine the astonishment of all on deck when the gaskets had been cast off and the canvas dropped loose, at seeing a perfect shower of rats fall squeaking through the air! The various sails in which the animals had harboured themselves were nibbled through and through, so as to resemble sieves, and were rendered so perfectly useless that the vessel could not leave until fresh ones had been bent in their place. For what reason the rats should have taken to the rigging, or how they managed to get aloft, was a speculation which, but for his vexation at the loss of his sails, the captain might well have amused himself in trying to solve.

THE OLD BARGE.

By THOMAS ST E. HAKE.

IN THREE CHAPTERS.—CHAP. I.—ALONGSIDE.

ON the river-bank, a mile above Battersea Bridge, there once stood—it stands there no longer—a small thatched house. It was constructed of wood; and the two diamond-paned windows, one on each side of the porch, looked out upon the Thames. The house was not accessible at all hours. At high-tide the garden was sometimes under water; and there were times—though these were fortunately of rare recurrence—when the whole structure threatened to get under weigh and take a seaward course with the ebb. But when the tide was out there was an impassable barrier of mud betwixt it and the water's edge. Between tides was the best moment for landing. A few rugged stone steps led up from the bank to a gateway facing the porch.

One evening, about the hour of sunset, a young girl came out into the garden, stopped at the gateway, and looked down at a barge moored alongside. It was an old barge, long and narrow: a 'one-horse' canal barge, that had seen its best days, and was now leading an amphibious existence, rising when the water rose, and sinking reposefully upon mud and slime when the water fell. It had marks of wet-rot upon it, and of dry-rot too. Time and tide had carried away every vestige of paint from its sides long ago.

On board this barge were seated two men. One of them was old, the other young. The latter, seated upon the upper deck, or cabin roof, was making a large net, which hung over the cabin door between him and his companion. He was a dark-skinned young man, with something of the gipsy in his appearance. He had black watchful eyes, when no one else's eyes were bent upon him; but when he thought himself observed—and he was keenly suspicious—all his senses seemed concentrated upon the net-work in hand. The old man, who was sitting in the stern, smoking a short clay pipe, appeared completely lost in thought. He was staring down-stream, towards Battersea Bridge; but it was obvious that he saw nothing—nothing of the light craft that floated to and fro—except in an absent-minded, dreamy way. He was a small-featured, weather-beaten bargee, with a white beard, and thick white eyebrows; and the deep lines at the corners of his eyes expressed a certain degree of cunning. There were deeper lines across the brow, which gave a care-worn, anxious look to the face. His broad muscular frame had, to all appearance, lost none of its strength; and he had large bony hands, which had a peculiar grasping tendency. But frequent work at the tiller, the handling of ropes, barge-hooks, and barge-oars for so many years, might account for this.

'Grandfather,' said the girl, after watching the two men for a moment in silence, 'you'll come in and sup with us to-night; won't you?'

The man gave a slight start at the sound of her voice. 'Why,' said he—'why should I come in to-night? Come now.'

'It's my birthday,' replied the girl, half apologetically.

'Ah!' and the old man glanced towards his companion, whose eyes, happening to be bent upon him, were at once cast down upon the net. 'What do *you* say, John?'

'I?' and he flashed a look at the old man and then at the girl. 'I'm not invited.'

At this moment the sound of sculls, falling with a soft plash upon the water, attracted their attention. They all looked quickly round. A light skiff, rowed by a handsome young fellow, pulled into the little creek where the barge was lying, and came alongside. 'Good-evening!' and the boatman, speaking in a cheery voice, raised himself into the barge and attached his skiff to the iron ring. 'Good-evening, all!—Bertha,' he added, looking up with an eager face towards the girl—'look!' and he pointed to a little scarlet flag that was fluttering in the stern of his boat. 'Brand-new, and hoisted in honour of the occasion. Happy returns!'

The girl's face had brightened at sight of the boat. The boatman's voice brought a look of

radiance into her eyes. They were large eyes, that contained something more than mere gratitude for his words. She reddened slightly as she said: 'Thank you, Davy;' and added: 'You'll stay and take some supper with us to-night?' Her look and tone expressed more than an invitation; it seemed like an appeal.

'Ay,' the old bargeman chimed in, 'Davy will stay.' Then glancing at the net-maker, he said: 'Come, Morison! you're invited too, you know. Go and keep them company.'

John Morison, never raising his eyes, never ceasing to work at the net, answered: 'You're not going to sup indoors, are you, Mr Landrick? I've never known you do it, birthday or no birthday. Very good. Then I shan't, and that settles the matter.'

As Davy Rotherford stood there, looking at these two men, an odd thought crossed his mind. What had put the idea into his head, and why it should come to him at such a moment, he could not comprehend. He had seen these men seated there scores of times before. He had seen Morison making nets, and always in the same attitude, ever since Landrick had brought his barge alongside and settled down here to pass his remaining days within sight of his own home. Perhaps it was something in these men's expressions, something in their attitudes towards each other. He could not say; but he saw in this swarthy young net-maker a quaint resemblance to a dark spider spinning a web; and he saw in the old bargeman an unconscious victim, who would presently get caught in the toils.

'Ah, well,' said Landrick, evidently displeased at Morison's refusal. 'Please yourself, John!—Run up to the house, Davy, and cheer up grandmother. She's a bit low-spirited, Bertha says. I shall stop o' board. It has been my habit for nigh upon fifty years; and habit is second nature. At my time o' life a man can't alter his habits, bad or good. He can only drift, as we say, with the tide.'

Bertha had already gone in; and Rotherford now followed. The room which he entered from the porch, without crossing hall or passage, was a low-pitched kitchen supported by oak beams overhead. The furniture was antique. A great clock, resembling a sentry-box, stood between the window and door, with the date upon its cracked and yellow face. The chairs were of dark oak, with bars in their backs like prison gratings. In one of these chairs was seated, beside a smouldering fire, a gray, wrinkled woman bent with age. She looked up quickly, as though startled out of a nap, as the young man closed the door.

'Who's that?' said she, shading her eyes with her hand. 'What's the matter? The tide ain't ebbing yet, is it?'

'Why, Mrs Landrick,' said Rotherford, 'don't you know me? I'm David—Davy Rotherford, your old favourite. Ain't you glad to see me?'

The woman's face softened. 'Come in, Davy,' said she—'come in. I thought it was Morison: I was dreaming about him. That's how it was. He's aboard with Landrick, ain't he?'

'Yes; and too busy net-making,' said Rotherford, 'to leave his work.—Why, how,' he added, as his odd thought suddenly recurred—'how does he happen to be troubling *your* dreams?'

A listening look became intently expressed in Mrs Landrick's whole attitude. 'Wait, Davy,' said she significantly—'wait! The tide ain't ebbing yet.'

Rotherford was standing with his eyes bent upon the woman. He was trying to put some clear construction upon her words. Suddenly he looked round and caught sight of Bertha Landrick standing at an inner door. Her face was so changed—so pale and expressive of alarm—that he took a quick step towards her, for she seemed on the point of falling. But she recovered almost before he reached her side, and lifted her finger to her lips to enforce silence. He sat down at the supper-table without a word; and Bertha began to busy herself in getting some provisions into a basket for her grandfather. Glancing presently towards the old bargeman's wife, Rotherford was surprised to find that the woman had relapsed into her drowsy state, with her head bent forward over the fire, and her hands clasped upon her lap.

Rotherford was the son of a master-lighterman. He was employed all day in his father's office; and of an evening was usually out upon the river. Landrick had served his father in his earlier days, and Rotherford had been for many a journey on river and canal with the bargeman when a boy. They had always been on friendly terms; and since Bertha had budded into womanhood, it would seem that Davy's visits by no means diminished.

As he sat there to-night, eating his supper with an appetite after his vigorous row up stream, he was greatly concerned when observing that Bertha would eat nothing. That unaccountable appearance of anxiety was still expressed in her restless eyes and pale cheeks. He longed to question her; but she scarcely remained at table two minutes at a time. Her thoughts seemed all the while to be centred in her grandfather; for she was constantly hurrying out to the barge to see if he needed anything. Davy found it impossible to get a word with her; and he had many words to speak of—words he had rehearsed over and over again to the quick dip and plashing tune of his sculls.

Bertha had gone down to the barge for the twentieth time at least, leaving Rotherford alone with the drowsy old woman. Mrs Landrick awoke suddenly, as she always made a point of doing, and glanced eagerly round. The red glow of the setting sun, looking aslant through the window, touched her face. 'Not night yet?' she muttered, blinking her eyes in the glare of sunlight—'Not night yet? I dreamt it was quite dark—dreadful dark, and that the tide was ebbing fast.—Where's Bertha?'

'On board the barge,' said Rotherford, crossing to the window. 'She'll be back directly.'

Mrs Landrick looked quaintly at the young man. There was a puzzled expression on her face. 'Davy,' said she, 'I dreamt that the barge was gone—that my old man was gone—and then—and then I awoke.'

'Gone?' said Rotherford, with a smile. 'Do you mean sunk?'

'I don't know,' said the woman. 'Gone—disappeared. I can't get the dream out of my head! I've had the dream before: it's the second time since daybreak. Can there be anything wrong?'

Look out, Davy. Is the old barge alongside?' said he.

'Yes, yes. It's lying snugly alongside,' said he. 'There's nothing wrong. But it's nearly high tide,' he added, 'and time for me to be getting home. Good-night, Mrs Landrick.'

'Good-night, Davy. You're sure the tide ain't ebbing yet?'

'Quite sure.'

When Rotherford reached the barge and stepped on board, he found that Morison had taken his leave. There was no spider; but the web lay spread across the deck. Bertha was in the cabin, putting a match to her grandfather's stove; and the old bargeman was busying himself with trimming his lamp for the night.

'So you still sleep on board, Mr Landrick?' remarked the young man.

'Ay, ay,' was the reply.

Rotherford looked thoughtful. 'Now, wouldn't it,' he persisted, 'at your time of life be safer to sleep indoors?'

The bargeman glanced suddenly round: 'Where's the danger here?'

'Oh, I was merely going to remark,' Rotherford hastened to explain, 'that you might find your house, perhaps, preferable to an old barge! The river-fogs and cutting winds are apt to get at one, you know, when the winter comes round. That's all.'

The girl was still bending down over the stove. She looked up with a thankful face at Rotherford. 'You are right, Davy,' said she—'I am sure you are right.'

'Davy,' said the old bargeman, as he lit the lamp and fastened it on its hook overhead, 'I've been used to this sort of life, as I've often told you, ever since I was a lad. And there's another thing I've told you,' he added, 'many a time—a man can't change his habits at my age. He must drift along with the tide.'

The sun had set; but it was still broad daylight, with a deep glow over the sky. It was an autumn evening; and a chilly wind fled across the river with a shivering sound and died away. The cry of some water-fowl in its flight over the marshes reached their ears, and that too died away. Was the night likely to prove a stormy one? In the upper sky the clouds were motionless, but their distorted shapes expressed commotion.

The desire on Rotherford's part to speak with Bertha, since he saw that it was equally her desire to speak with him, became intense; and as he lowered himself over the side of the barge and she went forward to loosen the rope, he seized the moment to whisper: 'Bertha! what is troubling you?'

She glanced about her with that look of dread again in her eyes. 'I cannot tell you now,' said she hurriedly. 'Grandfather will think there's something amiss if he hears us talking together. I'll try,' she added, 'though I can't promise—I'll try to come to you before the twilight is gone. Will you wait for me?'

'You know I will!' and he pressed her hand to his lips. Then he quickly added: 'At the old ferry steps?'

The girl nodded. The boat was detached; and with a turn of the sculls Rotherford was out in the tide. He rowed quickly down stream. Not

that there was any need for so much haste; for even had Bertha been able at once to slip away by the little pathway behind the house, she could not have reached the ferry steps before him. But Davy was naturally impetuous; and the mere thought of seeing Bertha, of speaking with her alone, impelled him to pull vigorously at his sculls. In a few minutes he reached the ferry steps, attached his boat, and walked up and down by the river-side, waiting impatiently for her. It was a deserted, lonely spot. For since Battersea Bridge had been built, the ferry had fallen into disuse, and few people passed this way. But it was a spot which Rotherford loved. He and Bertha had met here many a time. It was here that he had avowed his love for her; it was here that she had given him her promise that she would one day be his wife.

He was troubled about Bertha to-night. The strange look of dread upon her face, which he had never seen there before, sorely perplexed him. Was some peril at hand? He could comprehend nothing: his brain was crowded with a hundred odd fancies, that flashed upon him and took to flight, and came back again, only bringing bewilderment and a deeper state of anxiety concerning her.

Nearly half an hour had passed, and he had begun to despair of Bertha's coming; for it was beginning to grow dusk, and he knew that when the twilight was gone he must give up all hope of seeing her. But in the midst of these despondent thoughts he descried her pretty figure hurrying along the pathway. He hastened forward to meet her.

'Davy,' said the girl, answering his inquiring look, 'it's about grandfather I'm worried. A danger threatens him. I have come to tell you what it is. You will help me—will you not?'

He answered her earnestly: 'Dear Bertha! you know I will. Tell me what this trouble is.'

They sat down side by side on the ferry steps. Rotherford took the girl's hand, and looked with eager interest into her uplifted face. The twilight was fast fading out of the sky; and the gusts of wind that came across the Thames ruffled the water, and rocked Rotherford's boat as it lay close by with the tide lapping at its sides. With scarcely a pause and in a low hurried tone, Bertha explained to David Rotherford the cause of her distress.

'I'm going to tell you something,' said she, 'that grandfather believes is only known to himself and me. He is wrong. His secret is known to others. It is known to those who can and will injure him, as I fear, before daybreak—unless,' she added, 'you remain on guard all the night through. Can I ask you to do that?'

'Why, Bertha,' said Rotherford, 'do you think that would be a hardship to me? You do not know how deeply I love you.'

An expressive sigh escaped Bertha's lips. 'Davy,' said she, 'I will tell you everything. Ever since grandfather brought the old barge alongside the home, as you know he has led the same life on board as when he was an active bargeman making journeys up and down canals. He cannot change his habits, as he is always reminding us. The cabin is his home, and the little stove his fireside. How often have I seen

him seated there, smoking his old clay pipe, and looking as though he would scorn to change places with a Prince! He has been a very sober, thrifty man; and during his long lifetime he has saved a good deal of money. In his cabin on board the barge there is a small cupboard, and in this cupboard, locked up in a strong iron box, are all his savings—quite a little fortune.—Now, listen! If he is robbed of this, Davy, he and grandmother will be destitute. At least,' she added, 'they will probably be dependent upon me—upon the little that I can earn—for their support. For grandfather will be too broken to go on making or mending nets, as he does now. Indeed, I scarcely dare think what would happen to him if the mere dread of any such disaster crossed his mind.' As Bertha whispered these words there was fear in her look and tone.

Rotherford sat for a moment silent, staring intently over the darkening river, deep in thought. Suddenly he started up. 'You suspect some one,' he said; 'you know that a plot is hatching to rob your grandfather. Yes, and I can name the man.'

'Stay!' said Bertha. Rising hastily, she placed her hand upon his arm. 'Don't breathe his name, not even in my ear. The very thought of him frightens me. He may be listening, as I always think he is, in hiding hard by. He haunts me; and grandmother, as you must have noticed to-night, is haunted by him too.—Now, Davy,' the girl went on, 'I'm going to tell you something strange.' Her hand was still upon his arm, and her scared face still raised to his in the growing dusk. 'When it is high tide,' said she, 'the water lies close under our windows on the river-side; and often, the night being still, voices will come to us from the Thames and startle us out of our sleep, as a dream will sometimes do. It is sometimes a shout—possibly a warning of danger to some one—that wakes us. Sometimes it's a cry—a shrill cry of distress—that sets one's heart beating fast. But the voices that have meaning in them, speaking together as they go by with the tide, are the voices that frighten us most; and among these voices more than once we've heard *his* voice: we've heard enough to satisfy us that he's planning to rob grandfather of his gold; and it's to-night he's for carrying out his scheme. Davy! what shall we do?'

Rotherford took both the girl's hands in his own and tried to reassure her. 'Leave all to me! I will keep guard along the bank,' said he, 'and be within call of the old barge, until day-break. Be brave! Trust me, Bertha. Good-night.'

Bertha threw her arms about his neck without a word, and then she hastily left him and went back along the pathway to the thatched house.

It was now almost dark; and when Bertha entered the kitchen it was quite dark there; for the fire was almost out. But she managed to light the lamp by the smouldering embers, and with it in her hand she went through the rooms, only four in number, to assure herself that all was well before locking up the house for the night. In one of these rooms she found her grandmother sleeping; for Mrs Landrick always retired to bed at sunset, though she slept a good part of the day in her armchair by the fireside.

Bertha looked out of the window towards the place where the old barge was moored. Gusts of wind, louder and more frequent now, passed over the river; and the rain had begun to fall and beat against the panes. But the barge-lamp was burning steadily over the cabin door, and she felt satisfied that all was well on board.

She drew her grandmother's chair towards the fire and sat down to keep her guard within doors. She would not think of resting while Davy was out upon the Thames and on such a night. She would sit here till daybreak—till the danger was past, and then she would go down to the ferry steps to thank Rotherford for his watchfulness and devotion. She was exceedingly wakeful for an hour or more. She listened nervously to every gust of wind, as though she thought the voices that had frightened her on other nights might again reach her ear. But no sound of voices came; and gradually her eyelids drooped and her head sank upon her arm and she lay there fast asleep.

Suddenly a loud voice wakened her. It was a shout such as she had heard at night upon the Thames many a time before. But she started up with a cry upon her lips and ran to the window and looked out into the night. The light that she had seen burning steadily, before she fell asleep, was not visible now. She threw a cloak about her shoulders, took the lamp from the table, and hurried out. It was a pitch-dark night; and the wind and rain beat in her face. With difficulty she found her way to the water's edge. Raising the lamp over her head she looked down upon the dark river. A cry of despair escaped her—the old barge was gone!

LOVE.

STRANGE are his moods, and strange is he,

A child of divers ways:

He leads you on through flowery paths,

Through bright and golden days;

And guided by his gentle hand,

And listening to his song,

And gazing in his lovely eyes,

You walk for ever on.

And many pass you by, and they

Stretch out their hands in vain;

Some go with Death, and Sorrow some

Walk hand in hand with Pain;

And some with Scorn go laughing by,

And some who weep and moan:

But all of them young Love ignores,

And on they pass alone.

And through the pathways where they go

No ray of light appears;

No gleam of sunshine ever comes,

The way is wet with tears.

Sad for a moment, too, you grow,

And beg Love take them too:

He smiles, and shakes his golden curls—

'They cannot come with you.'

A TOURIST'S HOLIDAY IN VENICE.

DOES not a Tourist who has entered the hard service of Cook—who has made Baedeker's closely-printed itineraries his rule of life—who has thoughtlessly asked his friends before starting, 'What ought I to see?' and dare not face them again until he has obeyed their so lightly uttered, 'Go there; do this; be sure to see that'—does not such a one, by all that is fatiguing, deserve a holiday? Who shall condemn him if for once he plays truant, shuts the guide-book with as deep a sigh of relief as erstwhile the daybook, and leaves undone, wittingly, much that reason and conscience assure him he ought to have done?

Thus we, hard-wrought tourists, have taken a holiday; partly in bravado, defying the bondage of sight-seeing—partly in despair at finding our task beyond us. 'Venice,' says the methodical Baedeker, 'may be seen in three or four days;' and forthwith he allots to each day its share of churches and pictures and points of view. Have we not plodded after him, book in hand, day after day? Have we not cricked our necks agonisingly in the study of ceiling paintings, climbed towers, explored *pozzi*, with the best will in the world, only to find ourselves at the end of a week hopelessly in arrears? We play truant to-day, therefore, half from weariness, and half with the hardened conscience of the boy who knows if he did go to school it would only be to sit at the bottom of the class—in conspicuous failure.

Baedeker left at home, and our minds clear alike of cant and Ruskin, we wander forth with an unwonted air of leisure, to enjoy such humours of life as we may chance upon. It is a brilliant morning, in a course of fitful weather. Last night's rain lies still in the hollows of the pavement, and is baled out by gondoliers as they make their boats smart for the day's custom. One turns his cushions, revealing their orange-striped, fair-weather sides; another wreathes the prow of his boat with flowers; a third spreads the gayest of carpets for his patron's feet. But we do not

succumb to these lures, for, to tell the truth courageously, we find the swaying motion of a gondola anything but pleasant, and immensely prefer the penny steamer. So, with a half-formed purpose of ultimately taking a steamer up the Grand Canal, we drift with the general tide of humanity towards the square of San Marco. It is early, but the shops are open, and fascinating as usual, and we glance as we pass at the long array of windows stored with trinkets, pictures, photographs, lamps of wrought-iron, necklaces of coral and pearl, mosaics, and a thousand trifles of Venetian glass. Reaching a street corner, we are stayed by a gathering crowd, and find, emerging from one of the narrow *callés* or lanes between the closely-built, tall houses, a funeral procession, preceded by the most perfunctory of hired mourners, whose insignia of office, tall four-wicked candles, carried indifferently at all angles, flare smokily in the sunlight, and bespatter with wax as they pass the people and the pavement on either hand. Then follow the clergy and the bier and the real mourners, all slowly making for the adjacent church of San Moise, where the long service is to be performed. As they disappear within its great doors, the spectators disperse, most resuming with us their way to the square of San Marco, the heart of Venice. As we enter the square, a man mutely offers infant turtles for sale, creatures no bigger than garden snails, each in a little open box, with a supply of green meat of some sort—net cost probably ten centimes, although the vendor as we glance at them speculatively suggests half a franc. Next comes a dealer in sweetmeats, holding forth long wooden pins—I should say skewers, did that not suggest cat's meat—on which are threaded pieces of orange, or two or three figs, or shelled walnuts, each cluster encased in caramel, and valued at fifteen centimes.

At every doorway of the glittering shops all round the great arcade, ingratiating tradesmen greet you as you pass with cordial good-mornings, and entreat you, with spider-like friendliness, to walk into their parlours. Out-at-elbows loafers

make for you as you leave the importunities of the arcade for the open square, and thrust upon you brown paper cones of peas, wherewith to feed the numberless pigeons circling overhead, and pecking about, more tame than winter robins, at your feet. As you come near the glorious façade of St Mark's—fain to stand and look to your heart's content at the rich glow of these mosaic pictures filling the arches, and the oriental beauty of the clustered domes beyond them—a flight of greasy touts surround you, and clamour for the privilege of showing you the Campanile, the Baptistry, the Church itself.

There is no peace, no holiday, you perceive, for the tourist among these birds of prey, and you turn off at random out of the square into one of the narrow *callés* on your left. Narrow alleys are these streets, as a rule scarce more than three feet wide; and the light which reaches the little shops and ground-floor dwellings of the tall houses on either hand cannot even in midsummer be more than twilight. Yet all sorts of trades are carried on briskly in these obscure regions: milliners, bakers, smiths, jewelers, poulterers, display their wares in the dusky recesses on either hand; rows of poultry in the last instance ingeniously proclaiming their original nature by means of a few ruffled duck, or turkey, or ordinary hens' tail feathers still decorating their otherwise plucked and trussed carcasses. A calf's head, ghastly in its pallor, is faintly visible from the *chiaroscuro* of a butcher's shop; and at the adjacent barber's you find yourself literally face to face with, and within a few inches of, the be-lathered customer upon whom he operates. You emerge upon the open paved *campo*, originally the burying-ground of the little island parish you happen to be traversing. It is Saint's day in this parish—and some little boys have dressed a tiny shrine in the corner near the church, an old wooden chair, whose seat is covered with handfuls of grass, stuck with half-withered flowers; among them a floating wick in a saucer of oil burns in front of the little coloured print, representing some sacred subject, propped up like an altar-piece against the broken back of the chair. The boys dart at you with saucers, clamouring for a donation towards expenses; and before you can cross the *campo*, the church doors open, and out streams a procession of the Host—a larger edition, as it were, of the child's-play you have just seen. Tonsured, and glorious in stiffly-flowered brocade, they parade under a golden canopy, preceded by acolytes swinging empty censers, and bearing outshone candles in the face of the sun. Some dozen of the crowd, stopped perforce to make way for them, kneel, and uncover as the Host passes; most glance indifferently, and press on as soon as the way is clear.

The next *campo* we cross is almost deserted, except for a flower and vegetable market in one corner, and in the centre a Venetian baby, taking a walking lesson. I do not know whether the means of instruction used is peculiar to Venice; in any case, it is worth description. The little one-year-old was put, standing, in a sort of crinoline of wicker-work very wide at the base, and at the top fitting under the baby's arms. The mother stood some way off, the child stretching its hands to her, and at every step of the

little dancing feet the light framework slid forward, while it could not upset. The self-satisfaction of the baby with the random progress it found itself making was evident in its happy face and crowing laughter.

We found ourselves by this time again in the neighbourhood of San Moise. The funeral party had not yet emerged from the church; and in the nearest canal, gondolas draped with black and silver waited to convey the bier to the cemetery island. Later, as we wait on one of the floating barges used as steamboat stations, we see the funeral barge and its attendant gondolas slowly rowing away across the lagoon, accompanied by music, which sounds doubly sweet and mournful across the water. We are waiting for a steamer to the Lido, that long island which lies, a protecting barrier, between Venice and the sea. The Lido is a sort of Cockney pleasure resort for Venetians. There are no churches on it, neither altar-piece nor ceiling painting to constrain attention; and Baedeker scorns to include an excursion thither in any of his well-filled days. It is all modern, and somewhat vulgar. Big restaurants anticipate your custom in self-laudatory leaflets thrust upon you ere you land. Weather-beaten sailors, professional Jacks-ashore of the Brighton and Margate type, pursue you with trays of shells and coral; and to convey you across from the inner to the outer shore of the island, a tramway presents itself, drawn by two creatures almost as startling at first as griffins or dragons, but which you realise are horses—the forgotten beast of traffic and burden common to all the universe, Venice alone excepted. To jolt across the Lido behind them is of course a thrilling experience for the Venetian Cockney, and our consciences prick us not a little as we, on whom such pleasures palled in childhood, selfishly take possession of two of the seats so greatly in demand.

Arrived at the other side of the Lido, we may wander at will on the long sandy shores of the island, may sit on the grassy banks, where, here and there, storms and high tides have left a tangled wreath of seaweed to mark their farthest claim. And here we may, and we do, fleet the time, basking in the sunlight, and breathing in the drowsy balm of the soft sea-wind, as we watch the coming in of the tide from the wide Adriatic, whose waters, so wonderfully blue, break in iridescent foam at our feet, each bubble rainbow-hued, like the fairy-haunted foam-bells of Sir Noel Paton's pictures. We looked vainly for the little sea-horses, said to strew the shores here, and had indeed to condescend to buy some afterwards from the shell-vendors rather than return empty-handed. We searched in vain for these; but we chanced on a rarer wonder. Beaten down among the foam at the edge of the tide by the wind, which, though so warm, was too strong for him, we found a dragon-fly, his long rainbow-wings clogged with wet sand, his gleaming body limp and motionless. He revived, however, in the warmth and shelter of his rescuer's hand; and before we left the Lido, we placed him in the leafy seclusion of a garden hedge, to dry his beautiful wings at leisure and take stock of his strange experience.

Our holiday was over. We returned to Venice and our hotel, with its electric-lit *table-d'hôte*;

and although in the general jabber of exchanged confidences there we could not say we had 'done' a tithe of the sights our fellow-travellers could boast of since we parted at breakfast, yet, on soul and conscience, we thought, and incline to think still, that we had secured a holiday well worth remembering.

J. M. S. M.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXII.—THE DAY AFTER THE GHOST.

WHEN Mr Dering arrived at his office next morning he observed that his table had not been arranged for him. Imagine the surprise of the housewife should she come down to breakfast and find the ham and the toast and the tea placed upon the table without the decent cloth! With such eyes did Mr Dering gaze upon the pile of yesterday's letters lying upon his blotting-pad, the pens in disorder, the papers heaped about anyhow, the dust of yesterday everywhere. Such a thing had never happened before in his whole experience of fifty-five years. He touched his bell sharply.

'Why,' he asked, hanging up his coat without turning round, 'why is not my table put in order?' He turned and saw his clerk standing at the open door.—'Good heavens! Checkley, what is the matter?'

For the ancient servitor stood with drooping head and melancholy face and bent shoulders. His hands hung down in the attitude of one who waits to serve. But he did not serve. He stood still, and he made no reply.

He understood now. Since the apparition of South Square he had had time to reflect. He now understood the whole business from the beginning to the end. One hand there was, and only one, concerned with the case. Now he understood the meaning of the frequent fits of abstraction, the long silences, this strange forgetfulness which made his master mix up days and hours, and caused him to wonder what he had done and where he had been on this and that evening. And somebody else knew. The girl knew. She had told her lover. She had told her brother. That was why the new Partner laughed and defied them. It was on his charge that young Arundel had been forced to leave the country. It was he who declared that he had seen him place the stolen notes in the safe. It was he who had charged young Austin and whispered suspicions into the mind of Sir Samuel. Now the truth would come out, and they would all turn upon him, and his master would have to be told. Who would tell him? How could they tell him? Yet he must be told. And what would be done to the jealous servant? And how could the old lawyer, with such a knowledge about himself, continue to work at his office? All was finished. He would be sent about his business. His master would go home and stay there—with an attendant. How could he continue to live without his work to do? What would he do all day? With whom would he talk? Everything finished and done with. Everything—

He stood, therefore, stricken dumb, humble, waiting for reproof.

'Are you ill, Checkley?' asked Mr Dering. 'You look ill. What is the matter?'

'I am not ill,' he replied in a hollow voice, with a dismal shake of the head. 'I am not exactly ill. Yes, I am ill. I tried to put your table in order for you this morning, but I couldn't, I really couldn't. I feel as if I couldn't never do anything for you—never again. After sixty years' service, it's hard to feel like that.'

He moved to the table and began mechanically laying the papers straight.

'No one has touched your table but me for sixty years. It's hard to think that another hand will do this for you—and do it quite as well, you'll think. That's what we get for faithful service.' He put the papers all wrong, because his old eyes were dimmed with unaccustomed moisture. Checkley had long since ceased to weep over the sorrows of others, even in the most moving situations, when, for instance, he himself carried off the sticks instead of the rent. But no man is so old that he cannot weep over his own misfortunes. Checkley's eye was therefore dimmed with the tear of Compassion, which is the sister of Charity.

'I do not understand you this morning, Checkley. Have you had any unpleasantness with Mr Austin—with any of the people?'

'No—no. Only that I had better go before I am turned out. That's all. That's all—he repeated the words in despair. 'Nothing but that.'

'Who is going to turn you out? What do you mean, Checkley? What the devil do you mean by going on like this? Am I not master here? Who can turn you out?'

'You can, sir, and you will—and I'd rather, if you'll excuse the liberty, go out of my own accord. I'm a small man—only a very small man—but, thank God! I've got enough to give me a crust of bread and cheese to live upon.'

'I tell you what, Checkley: you had better go home and lie down and rest a little. You are upset. Now, at our age we can't afford to be upset. Go home, and be easy. Old friends don't part quite so easily as you think.' Mr Dering spoke kindly and gently. One must be patient with so old a servant.

Checkley sobbed and choked. Like a child he sobbed. Like a child of four, Checkley choked and sniffed. 'You don't understand,' he said. 'Oh, no—you can't understand. It's what I saw last night.'

'This is very wonderful. What did you see? A ghost?'

'Worse than a ghost—who cares for a ghost? Ghosts can't turn a man out of his place and bring him to be a laughing-stock. No—no. It was a man that I saw, not a ghost.'

'If you can find it possible to talk reasonably'—Mr Dering took his chair and tore open an envelope—'when you can find it possible to talk reasonably, I will listen. Meantime, I really think that you had better go home and lie down for an hour or two. Your nerves are shaken; you hardly know what you are saying.'

'I was in Gray's Inn yesterday evening. By accident, at eight.' He spoke in gasps, watching his master curiously. 'By accident—not spying.'

* Copyright 1892 in the United States of America by Harper & Brothers.

No—by accident. On my way to my club—at the *Salutation*. Walking through South Square. Not thinking of anything. Looking about me—careless-like.

'South Square, Gray's Inn. That is the place where the man Edmund Gray lives: the man we want to find and cannot find.'

'Oh! Lord! Lord!' exclaimed the clerk. 'Is it possible?' He lifted his hand and raised his eyes to heaven and groaned. Then he resumed his narrative.

'Coming through the passage, I looked up to the windows of No. 22—Mr Edmund Gray's Chambers, you know.'

'I believe so.' Mr Dering's face betrayed no emotion at all. 'Go on; I am told so.'

'In the window I saw Mr Edmund Gray himself—himself.'

'Curious. You have seen him—but why not?'

'The man we've all been so anxious to find. The man who endorsed the cheque and wrote the letters and got the papers—there he was!'

'Question of identity. How did you know him, since you had never seen him before?'

This question Checkley shirked.

'He came down-stairs five minutes afterwards, while I was still looking up at the windows. Came down-stairs, and walked out of the Square—made as if he was going out by way of Raymond's Buildings—much as if he might be going to Bedford Row.'

'These details are unimportant. Again—how did you know him?'

'I asked the Policeman who the gentleman was. He said it was Mr Edmund Gray. I asked the newspaper boy at the Holborn entrance. He said it was Mr Edmund Gray, and that everybody knew him.'

'So everybody knows him. Well, Checkley, I see nothing so very remarkable about your seeing a man so well known in the Inn. It adds nothing to our knowledge. That he exists, we know already. What share, if any, he has had in this case of ours remains still a mystery. Unless, that is, you have found out something else.'

Checkley gazed upon his master with a kind of stupor. 'No—no,' he murmured. 'I can't.'

'What did you do, when you found out that it was the man?'

'Nothing.'

'You did nothing. Well—under the circumstances I don't know what you could have done.'

'And he walked away.'

'Oh! He walked away. Very important indeed.—But, Checkley, this story does not in the least account for your strange agitation this morning. Have you anything more to tell me? I see that you have, but you seem to experience more than usual difficulty in getting it out.'

The clerk hesitated. 'Do you,' he asked at last—'do you—happen—to know Gray's Inn?'

'I daresay I have been there—years ago. Why?'

'Oh! you haven't been there lately, have you?'

'Not lately—not for forty years, or some such inconsiderable period. Why?'

'I thought you might yourself have met Mr Edmund Gray—been to his chambers, perhaps.'

Mr Dering sat upright and laid his hand upon

his letters. 'Checkley,' he said, 'I am always willing to make allowance for people in mental distress, but I think I have made allowance enough. Come to the point. Have you lost any money?'

'No—no; not so bad as that—but bad enough. No, I couldn't afford to lose money. I haven't got enough to spare any. But I got a shock—kind of stroke—partly because of the man I met, and partly because of the person with him.'

'Oh! who was that? Are we arriving at something?'

'I hadn't told you that. The person who was sitting at the open window with him, who came down-stairs with him, and walked out of the Square with him, was no other than your own ward, Miss Elsie Arundel herself!'

'Oh! why not?' asked Mr Dering carelessly. 'She told me yesterday, was it? that she knows him.'

'If it had been any one else she was with,' he replied, mixing up his grammar—'if it had been any one else who was with her—I wouldn't have been surprised! But to see the two together. That gave me a turn that I can't get over.'

'Still—why not? Miss Elsie Arundel has already told me that she is acquainted with Mr Edmund Gray.'

'What? She has told you—she has actually told you? Oh! what has she told you? Oh! Lord! Lord! What is a man to say or to do? She told you—what is best to do?' He wrung his hands in his distress and his perplexity.

'I cannot understand, Checkley,' said Mr Dering with emphasis, 'the reason for this display of excitement. Why should she not tell me or anybody else? Do you suppose that my ward is doing anything clandestine? She has told me that she is acquainted with this man. She asserts further—that we have made a great mistake about him. What she means, I cannot understand. She says, in fact, that this gentleman is a perfectly honourable person. It is possible that he has deceived her. It is also possible that the name of Edmund Gray had been wrongfully used in the papers which belong to the case. Certainly it was an Edmund Gray who endorsed the first cheque: and an Edmund Gray having an address at 22 South Square whose name is connected with the later business. Well, we shall see presently.—When do you take out the warrant for the arrest of this man? By the way, Elsie Arundel implores me not to allow that step. When are you going to do it?'

'This morning, I was going to do it. Everything is ready—but—'

'But what?'

'I can't do it now.'

'The man is clean gone off his head.'

'Leave it till to-morrow—only to-morrow, or Monday. Before then, something is certain to turn up. Oh! certain sure it is. Something must turn up.'

'There is certainly something that you are keeping behind, Checkley. Well—wait till Monday. To-day is Saturday. He can't do very much mischief between this and Monday.—That's enough about Edmund Gray. Now, here is another point, to which I want a direct answer from you. My brother asserts, I believe on your authority, that Athelstan Arundel has been living

in a low and profligate manner in some London suburb, and that he was in rags and poverty early this year. What is your authority for this?

'Why, I heard him confess—or not deny—that he'd been living in Camberwell in bad company. It was at the *Salutation* I heard it. He didn't see me. I'd got my head behind a paper. He never denied it.'

'Humph!—And about the rags?'

'I don't know anything about the rags.'

'Very likely there is as much foundation for the one charge as for the other. Three or four years ago, he was in America, to my knowledge. He wrote to me from America. I now learn, on the authority of his sister, that he only came back a month ago, and that he has been and is still in the service of an American paper. What have you got to say to that?'

'Nothing. I don't feel as if I could say anything. It's all turned upsy down. That won't do, I suppose, no more than the rest.'

'But, my friend, if that is true, your theory of conspiracy and confederacy, which you took so much pains to build up, falls to the ground as far as Athelstan is concerned.'

'Yes.—Oh! I haven't nothing to say.' It was a mark of the trouble which possessed him that his language reverted to that of his young days, before he had learned the art of correct speech from the copying of legal documents. He preserved the same attitude with bent head and hanging hands, a sad and pitiful object.

'Since Athelstan was not in London during the months of March and April, he could have had no hand in the later forgeries. And it is acknowledged that the same hand was concerned both in the earlier and the later business.'

'Yes—yes—the same hand. Oh! yes—the same hand,' he repeated with pathos unintelligible to his master. 'The same hand—the same hand; yes—yes—the same hand—that's the devil of it—same hand done it all.'

'Then what becomes of your charge against my young Partner? You were extremely fierce about it. So was my brother. You had no proofs—nor had he. If the same hand was in both forgeries, it could not have been the hand of George Austin. What do you say to that?'

'Nothing. I'm never going'—still standing hands hanging—'to say anything again as long as I live.'

'But you were very fierce about it, Checkley. You must either find more proofs or withdraw your accusation.'

'Oh! if that's all, I withdraw—I withdraw everything.'

'Why did you bring that charge then, Checkley? You've been making yourself very busy over the character of my Partner. You have permitted yourself to say things in the office before the clerks about him. If it turns out that he has had nothing to do with the business, you will be in a very serious position.'

'I withdraw—I withdraw everything,' the old clerk replied, but not meekly. He was prepared to withdraw, but only because he was forced.

'Remember, too, that it was you who brought the charge against young Arundel.'

'I withdraw—I withdraw everything.'

'You went so far as to remember—the other

day—having seen him replace the notes in the safe. What do you say to that?'

'I withdraw.'

'But it was a direct statement—the testimony of an eye-witness. Was it true or not?—I don't know you this morning, Checkley. First, you appear shaking and trembling: then you tell me things which seem in no way to warrant so much agitation. Next, you withdraw an accusation which ought never, to have been made except with the strongest proof. And now you wish to withdraw an alleged fact.'

Checkley shook his head helplessly.

'I acknowledge that the business remains as mysterious as before. Nothing has been found out. But there remains an evident and savage animosity on your part towards two young gentlemen in succession. Why? What have they done to you?'

Checkley made reply in bold words, but still standing with hanging hands: 'I withdraw the animosity. I withdraw everything. As for young Arundel, he was a supercilious beast. We were dirt beneath his feet. The whole earth belonged to him. He used to imitate my ways of speaking, and he used to make the clerks laugh at me. I hated him then. I hate him still. It was fun to him that an old man nigh seventy, with no education, shouldn't speak like a young gentleman of Oxford and Cambridge College. He used to stick his hat on the back of his head as if it was a crown, and he'd slam the door after him as if he was a Partner. I hated him. I was never so glad as when he ran away in a rage. He was coming between you and me, too—oh! I saw it. Cunning he was. Laying his lines for to come between you and me.'

'Why—you were jealous, Checkley.'

'I was glad when he ran away. And I always thought he'd done it, too. As for seeing him put the cheque back in the safe, I perceive now that I never did see him do it. Yet I seemed to think at the time that I'd remembered seeing him do a kind of a sort of a something like it. I now perceive that I was wrong. He never done it. He hadn't the wits to contrive it. That sort is never half sharp. Too fine gentleman for such a trick.—Oh! I know what you are going to say next. How about the second young fellow? I hate him too. I hate him because he's the same supercilious beast as the other, and because he's been able to get round you. He's carneyed you—no fool like an old fool—and flattered you—till you've made him a Partner. I've worked for you heart and soul for sixty years and more, and this boy comes in and cuts me out in a twelvemonth.'

'Well! but Checkley—hang it!—I wouldn't make you a Partner.'

'You didn't want no Partners. You could do your work, and I could do mine and yours too, even if you did want to go asleep of an afternoon.'

'This is grave, however. You hated Mr Austin, and therefore you bring against him this foul charge. This is very grave, Checkley.'

'No—I thought he was guilty. I did, indeed. Everything pointed that way. And I don't understand about young Arundel, because he came into the *Salutation* with the Cambridge gentleman who gets drunk there every night,

and he said that he'd lived at Camberwell for eight years with bad company as I wouldn't name to you, sir. I thought he was guilty. I did, indeed.'

'And now?'

'Oh! now it is all over. Everything's upsy down. Nobody's guilty. I know now that he hasn't had anything to do with it. He's a young man of very slow intelligence and inferior parts. He couldn't have had anything to do with it. We ought to have known that.'

'Well—but who has done it, after all?'

'That's it.' Checkley was so troubled that he dropped into a chair in the presence of his master. 'That's it. Who's done it? Don't you know who done it? No—I see you don't so much as suspect. No more don't I. Else—what to do—what to say—Lord only knows!' He turned and ran—he scuttled out of the room, banging the door behind him.

'He's mad,' said Mr Dering. 'Poor man! Age makes men forgetful, but it has driven Checkley mad.'

THE COLOURS OF THE SEA.

NINE people out of ten, if asked to make a definite statement as to the colour of the water of the ocean, would unhesitatingly pronounce it to be blue. 'The deep blue sea' and 'the azure main' are familiar expressions, and the blueness of the ocean is looked upon as its unvarying attribute. Yet the sea that fringes our shores is not blue; its colour is a much nearer approach to green; and in other parts of the world the departure from the tint that is supposed to belong peculiarly to the world of waters is even more marked. From the earliest days, mariners have been struck by the variation in the colours of the sea. The hardy Phœnician sailors, when first they ventured away from the blue waters of the Mediterranean, were astonished to find themselves floating on seas that seemed to belong to another world, so different was their hue; and at a later day, Columbus and the other hardy pioneers in the discovery of the New World were equally surprised at the various coloured waters which they encountered. This change of colour in the sea was a phenomenon that influenced the superstitious and faint-hearted amongst those venturesome crews more than any other cause except the trade-winds: the wrath of Heaven seemed to them to be pictured in the unwonted tints which the familiar element assumed; and all the tact and firmness of their leaders was needed to combat the feelings thus aroused. Broadly speaking, the waters of the ocean may be divided into two colours—blue and green: the former prevailing in the tropics; the latter, in the higher latitudes. It has been proved that the blueness of sea-water holds a constant ratio to its saltness; that is to say, the greater the amount of salt present in it, the more vivid the shade of blue that it assumes. The specific gravity of green sea-water is less than that of blue; so, when the colour of the ocean is observed to change from blue to bluish green, and from bluish green to green, it may be taken for granted that it decreases at the same time

in saltness and weight. The waters that surround these islands and stretch between them and the North Pole are by the continual melting of the ice of the Arctic Circle made fresher than the waters that lie under the burning skies of the tropics; and because they are fresher, they are green instead of blue.

There are numerous exceptions to the broad rule that we have enunciated; but, as exceptions should, they only serve to make its truth more apparent. For instance, great tracts of green water may be met with in the neighbourhood of the Cape Verd and the Canary Islands, where generally the ocean shows an unvarying shade of blue. This is caused by the mighty flood of fresh water which the river Congo pours into the ocean there; and as the mouth of this great stream is neared, the waters lose their blueness more and more completely, until they pass from green into the brown which marks the actual mouth of the river. Every one knows that river-water is lighter than the salt water of the ocean, and this lighter water floats on the top of the heavier, spreading out for a distance of hundreds of miles on either side of such a huge artery as the Congo. The frigate *Gazelle*, which was sent out by the German government for the purpose of exploring the ocean and laying bare some of its secrets, furnished a convincing proof of the difference in colour between river and sea water. Both on entering and leaving the mouth of the Congo, the action of her screw was observed to bring up water from below the surface which formed a broad green track at her wake; while the brown waters of the river continued to flow on either side, and gradually closed over the green path which showed the true colour of the ocean there.

In the same way as green water is found within the tropics, water of the intense, vivid blue usually peculiar to the equator and its neighbourhood is met with in the more temperate latitudes, that commonly exhibit sea-water of a bluish-green or green pure and simple. The blue waters of the Mediterranean, culminating in the wonderful ultramarine of the Grotto of Capri, seem out of place, until we consider that a comparatively small amount of fresh river-water finds its way into this land-locked sea, resulting in a state of saltness of its waters which renders them of the brilliant hue that is so charming a feature of the scenery of Southern Europe. The Gulf-stream, again, that grand dispenser of warmth gathered from the fervid sun of the tropics, gives another example of the presence of blue waters in high latitudes. It preserves the azure tint which marks the seas whence it originates long after it has left them, and right across the Atlantic carries a shade of blue that reminds the sailor in the ship crossing it of brighter seas and skies than are ever seen outside the tropics. The current that flows towards the equator from the north, called the Labrador Current, meets the Gulf-stream between the Banks of Newfoundland and the Bermuda Islands, with the result that the Atlantic is there divided into broad stripes of blue and green-blue where the southern-born waters are making their way to temper the cold of less genial climes; green where the northern stream is flowing along bearing its chill flood to the sunny south.

The colour of the Red Sea has been at one time and another ascribed to a variety of causes. It is really owing to the presence of innumerable microscopic algae; but red sand and red animalcules have both been advanced as the reason for the peculiar hue of the water of this sea, the shores of which are the hottest spot on the face of the earth. The White and Black Seas are named from the never-melting snow and ice which surround the one, and the bleak inhospitable shores and sudden tempests of the other.

Minute algae, called 'diatoms,' are responsible for the black waters that are often met with in the northern seas. Whalers always seek these tracts of dark water, as they know that there they are most likely to encounter the objects of their search. The little animals upon which whales feed are supported by diatoms, which are consequently the indirect cause of the presence of the huge sea-mammal in the waters which they blacken by their inconceivable numbers. The Yellow Sea derives its colour from the presence of a minute vegetable organism similar to that which gives to the Red Sea its distinctive hue. Darwin, in the account of his voyage round the world in the *Beagle*, adduces two interesting instances of coloured waters in the following words: 'On the coast of Chili, a few leagues north of Concepcion, the *Beagle* one day passed through great banks of muddy water, exactly like that of a swollen river; and again, a degree south of Valparaiso, when fifty miles from the land, the same appearance was still more extensive. Some of the water placed in a glass was a pale reddish tint, and examined under a microscope, was seen to swarm with minute animalcules, darting about, and often exploding. They are exceedingly minute, and quite invisible to the naked eye, only covering a space equal to the square of one-thousandth of an inch. Their numbers were infinite; for the smallest drop of water which I could remove contained very many. In one day we passed through two spaces of water thus stained, one of which alone must have extended over several square miles. What incalculable numbers of these microscopical animals! The colour of the water as seen at some distance was like that of a river that has flowed through a red clay district; but under the shade of the vessel's side it was quite as dark as chocolate. In the sea round Tierra del Fuego, and at no great distance from the land, I have seen narrow lines of water of a bright red colour, from the number of crustacea, which somewhat resemble in form large prawns. The sealers call them "whale-food." Whether whales feed on them I do not know; but terns, cormorants, and immense herds of great unwieldy seals, derive, on some parts of the coast, their chief sustenance from these swimming crabs.'

Many purely local causes influence the colours of marine waters, and give them certain decided and constant shades. Thus, a bottom of white sand will communicate a grayish colour to the sea, if it be not very deep; while yellow sand will give a sort of apple-green tint. The presence of rocks lends a deep shade to the water that covers them. Red sand exists on the bed of the ocean at some places, notably the Bay of Loango, and here the waters assume a deep red hue. These are some of the more prominent

instances of the variety of colours that different circumstances give to water which in every instance appears perfectly transparent and colourless when viewed in an untinted vase.

THE OLD BARGE.

CHAPTER II.—WITH THE EBB.

MEANWHILE, Rotherford had stood on the ferry steps, watching Bertha's retreating figure until the twilight had hid her from view. He had then gone to his boat and cautiously rowed down stream, with the wind and rain driving up against the tide and growing rougher as the night fell. He kept close under the bank, out of the rapid current. His intention was to pull alongside Landrick's barge while there was still a gleam of light, make fast there, and remain on the alert till daybreak. And although the prospect was anything but promising, even to an ardent lover, David Rotherford would have gone through a severer ordeal for Bertha's sake. For was not this solitary night-watch on the Thames under her very window? And within doors—as he judged by the light—she was keeping night-watch too. He came up alongside the barge as noiselessly as possible in order not to disturb Landrick, and attached his boat to the stern, where his presence would not be suspected.

The tide had begun to ebb. Rotherford listened intently for the slightest noise. All that Bertha had told him about the weird midnight voices on the river recurred to him now. The wind blew boisterously, and in the sound he imagined that he heard whisperings on all sides; and he frequently peered round with a strong conviction that there was a noiseless figure moving about on the barge—a black, crawling thing, like a huge spider, and blacker than the night. So strong did this conviction become that at last he resolved to go stealthily on board and satisfy himself concerning the dark shadow. If it existed only in his brain so much the better; if not—

Suddenly the barge began to move—move slowly out of the creek towards mid-stream; and Rotherford's boat, swinging round, glided after it—glided away with the ebbing tide! Rotherford could hardly believe his senses. It was like a dream—a strange nightmare. His first thought was to raise an alarm; but as he opened his lips the thought flashed across him that the figure—a dim moving figure now—was on the deck and creeping towards the cabin; and were he to cry out, his boat would be cut adrift. It was still in his power to leap on board the barge and go to Landrick's aid.

As the figure went into the cabin, leaving the barge to take its course with the tide, Rotherford drew alongside and crept up into the stern, advancing on hands and feet across the deck towards the little skylight. His heart throbbed loudly as he looked down. The cabin lamp, still hanging in its place, was burning brightly, and its light fell upon the dark eager visage of John Morison. His figure was bent forward, and his hands—no longer employed in mending nets—were busily occupied in opening a cupboard over Landrick's head. The old bargeman was lying asleep in his bunk; he was enveloped in a rough coat; and

over this coat was a quantity of netting. Should he awake suddenly and attempt to rise, he must become entangled in this web. This was obviously the 'spider's' handiwork, thought Rotherford. The intention was doubtless to throw Landrick into confusion while he completed his purpose and made his escape.

In another moment Rotherford was standing at the cabin door. Morison's arm was already plunged into the cupboard. As Rotherford's shadow fell upon him he looked round : a gasping cry escaped him, and the box dropped ringing and clinking upon the floor. The man sprang towards Rotherford, more with the intention of making his escape than of showing fight ; but Davy caught him by the throat, flung him down as he would have done a dog, and stood over him ready to repeat the action should he move. But Morison made no attempt to rise ; he lay cringing at the other's feet, and trembling from head to foot.

The ringing sound of the iron box, or more possibly the money inside it, had roused Landrick. He started up on his elbow and stared at these two men as though he doubted whether he were awake. The one man, standing silently over the other under the dim light of the barge-lamp, was as startling and unexpected as any dream could be.

Davy was the first to break the silence. 'Mr Landrick,' said he, in a rapid manner, 'the barge is adrift ! Throw that netting off you, if you can, and get to the tiller. The tide's ebbing fast. We shall be down on Battersea Bridge and broken to pieces against the timber, if you're not quick. I'll look to this fellow : it's all his work.'

'Let him go, Davy !' cried the old bargeman—'let him go overboard, or I shall pitch him there. Let him take his choice.'

Rotherford obeyed. He stepped back a pace to allow Morison to rise. 'You hear ?' said he.

Morison had heard. He instantly sprang to his feet and glanced round with an air of desperation. There was a slight gleam of light in the sky. The day was breaking. It was just light enough to indicate objects over the river and on either bank, in dark uncertain outline. The nearest object—and it was the one that instantly caught Morison's quick eye—was Rotherford's boat at the stern. He ran aft and flung himself into it. A minute afterwards he was rowing away in the semi-darkness ; and the very fluttering of the sculls upon the water expressed the creature's abject fright.

Old Landrick now seized the tiller and pointed down-stream. 'Davy,' said he, 'that's Battersea Bridge yonder. Stand steady. We shall be upon her, I'm afeared, afore we can get the barge righted for shootin' between the piles. Stand steady, lad, and a sharp lookout !' he added ; 'ay, there's rocks ahead.'

Rotherford made no reply. He bent down and kept his eyes fixed upon such dim outlines of the bridge as were indicated in the uncertain morning light.

It was a dark mass, with some dozen oil-lamps at equal distances, spanning the Thames. This wooden structure, which connected the antique parish of Battersea with Old Chelsea, was an object of dread to all who navigated 'above bridge.' Its history stretches back a century or

more. During the severe winter of '95 the bridge had been considerably damaged by huge blocks of accumulated ice, that had become attached to the piles, drawing them rudely at the rise of the tide. It was not until the end of the last century, about the period of this tale, that the bridge was even lighted with lamps : it was indeed the only wooden one that possessed this poor accommodation. In those days the bridge had nineteen openings, varying from thirty-one feet in the centre to sixteen at the ends : the piers were formed of groups of timber piles with a clear headway of fifteen feet under the centre span at high-water. It was towards this centre that Landrick now exercised all his ingenuity to direct the barge. No harder task could have been set a bargee in broad daylight ; but it was still practically night ; only a glimmer of dawn, in dusky gray, stretched across the sky beyond the openings under the bridge. And the tide was ebbing faster now, was carrying this old and slender craft straight down upon the massive piles ; and only a miracle could prevent a collision.

No words passed between Landrick and his young companion. Each was at his post. Rotherford stood in the forepart of the barge-boat, hook in hand, and with a 'fender' ready if needed to deaden the blow. The old bargeman, with a firm grasp upon the tiller, looked keenly ahead. He knew that his cabin home—his iron box that contained all his savings—his life and Davy's too—depended upon such skill as he possessed, such as time and tide were doing their utmost to defeat. A minute more—one more gleam of daylight and a slower tide—and the barge might be saved ! But that could not be : to shoot between the piles at so narrow an opening was now impossible. The barge swung round. Rotherford shouted loudly and ran aft—shouted to Landrick to let go the tiller and cling to the rope astern for his life. A moment afterwards there was a crash ; the barge creaked and shivered, and began to settle down among the piles, with the water rushing in through a leak in her side.

CHAPTER III.—CONCLUSION.

When Bertha discovered that the barge was gone from its moorings, she did not lose her presence of mind : she kept a cool head and acted promptly. Passing with her lantern farther within the creek, and walking at the water's edge, she came upon a little tub of a boat. It belonged to her grandfather ; and it was one which she had used for crossing the river since she was a child. The boat was propelled by dropping a short oar over the stern, and screwing in fish-tail fashion to and fro. The girl stepped into this boat, fixed the oar, and began to work her course out into the river. The barge could have taken but one direction—down-stream with the tide. And in that direction she now began to urge the boat, making but slight noise with the oar. She listened and looked about her, wondering where Rotherford could be. Had he not promised her that he would watch the night through ?

The deep silence on all sides troubled her. And even the gleam of light that came into the sky only roused a momentary sense of reassurance. For the sight of the dark bridge brought a dreadful thought to her brain and awoke

sudden terror and despair. She felt the danger ; and now the gleam of daybreak came to show her, like a beacon, where that danger lay. She could not hide from herself that the barge, with her grandfather on board, had probably sunk to the bottom of the river. And in the dead of night ! It was horrible to think of. But where was Davy ? The mere thought of him gave her courage. Had he gone for aid ? He must know what had happened : he had feared to alarm her. She paused in her rowing and called to Rotherford by name : 'Davy !'

But no answer came back to her across the river—not a sound. The sense of loneliness and dread grew upon her now ; and yet she persevered, screwing vigorously at the oar—hurrying on towards Battersea Bridge with the tide racing after her and dancing in dark eddies round her boat. As she neared the bridge, always listening with intentness, she fancied that she heard voices—voices among the shadowy piles. Her heart beat loudly. She went down on her knees and began working like a mad woman at the oar. In her anguish she again cried out : 'Davy—Davy !'

At last ! It was his voice : it came to her from under the bridge and urged her to fresh exertion : 'Bertha ! we are here—your grandfather and I, and the barge is sinking fast. Can't you see us ? —There ! Now ship your oar. I can hold the boat.—Can't you see us now ?'

Bertha could see nothing—hear nothing. A darkness deeper than the night came across her eyes ; her senses were forsaking her ; and as Rotherford reached out his hand and brought the boat alongside the sinking barge, the girl dropped down unconscious in the stern.

In a moment old Landrick had stepped into the boat and Davy too, but not a moment too soon. Rotherford had scarcely taken the oar and pushed the boat clear of the woodwork under the bridge, when the barge rolled upon its broken side and went down stern foremost. The tide swept over it, eddying and gurgling among the piles.

'Gone !' cried Landrick with a groan. 'Home and savings too, Davy, all swallowed up. I'm a ruined man.'

Rotherford answered angrily : 'Come, come, Mr Landrick ! What are you thinking about ? If it hadn't been for Bertha, we should have been swallowed up too. Look to your grand-daughter, sir. Don't you see she has fainted ?'

'Ay, ay. Poor thing !' and he bent down over her.

Rotherford, setting the boat's head against the tide and getting free of the bridge, steered towards the ferry steps where he and Bertha had met in the twilight on the previous evening.

Nothing more was seen of John Morison. But Rotherford afterwards learned that the notorious *Red House* tavern in Battersea Fields—in those days a den of gamblers and thieves—had been his favourite resort. It then became evident, even to the old bargeman, that the net-mending was a mere pretext for discovering the best means of gaining possession of the iron box which Landrick had guarded day and night in the barge cabin ever since he had taken up his moorings beside the thatched house.

At low tide, when Rotherford rowed back with

Landrick under Battersea Bridge to examine the spot where the barge had sunk, they were not a little surprised to discover the old craft lying half out of water. Upon closer inspection, it was found that she had got caught among the piles, and had become wedged in between them so firmly that there was no likelihood of her sinking deeper if she could be recovered before the tide broke her to pieces.

The difficulty proved comparatively slight. On the following day, at low tide, the barge was buoyed up and towed back to its moorings. But it was no longer habitable : there was a great hole in the stern as well as in one side. Landrick was compelled to take up his quarters in the thatched house, and here he soon settled down, mending nets all day long, and in the evening sitting down opposite Mrs Landrick in the chimney corner.

The iron box was found upon the cabin floor, where it had fallen. And when David Rotherford had won Bertha's hand, and become a partner in his father's firm, he induced Landrick to invest his savings in the lighterman's business, where they proved far more profitable than when lying 'cabined and confined' on board the old barge.

SOME CURIOUS MARRIAGE CUSTOMS IN SCOTLAND.

ALONG the northern and north-eastern coasts of Scotland there are many towns and villages whose populations consist mainly of fishing-folk. These people live as a class unto themselves. They have their own peculiar customs and their own deep-rooted superstitions. Amongst these, marriage is the occasion for many a strange ceremony which is unknown in other classes of society.

On the shores of the Moray Firth—the spot need not be more specifically localised—there is a flourishing little village of some fourteen hundred inhabitants, consisting chiefly of fisher-folk. Every autumn at the close of the herring-fishing there is a succession of weddings in the village, and the superstitious and uniform customs associated with these ceremonies are interesting and somewhat unique. The young man and maiden do not court in the orthodox fashion. Their method is much more prosaic, and what is characteristic of one case may generally be accepted as characteristic of them all. There is, of course, an occasional instance of genuine good old-fashioned courtship, but that is rather a rare exception.

'Mother,' said one young man on his return from a successful herring-fishing, 'I'm goan to get merried.'

'Weel, Jeems ; a' think ye sh'd just gang an ask yer cousin Mārack.' And as he had no particular preference, he went straight away to ask her.

'Wull ye tak me, Mārack ?' was the brusque and business-like query which he put to the young woman in the presence of her sister Bella.

But Mary had promised her hand to another that same evening. 'I canna tak ye, Jeems,' was her reply ; and then, turning to her sister : 'Tak ye 'im, Bellack.' And the sister took him.

Here is another instance, and the difference of

method is not very pronounced. Meg was a young woman of some nineteen summers, fairly good-looking, as the majority of the girls are. She was visiting a neighbouring house, when her mother put her head in at the door and addressed her: 'Yer cousin Danny is doon the hoose askin' if ye'll hae 'im.'

'Tell 'im to come an' ask,' is Meg's sensible answer. And when Danny forthwith comes and repeats the request, Meg simply says: 'Ay, Danny.'

These specimens, with slight variation, are of the most common occurrence. The young folks sometimes have no immediate expectation of receiving an offer of marriage. They may anticipate a 'Wull ye tak me?' from some one when they think their turn has come; but as often as not they have no indication beforehand of who the particular swain is to be. It must not be supposed that the young man is always successful in his advances. There is at least one authentic case in the village where the would-be proposer was refused by five successive young women in the course of the same evening.

When the offer of a young man is accepted, he is said to be 'contracted,' and there is no delay in carrying through the other necessary formalities. They forthwith go through the ceremony called 'beuking,' which is the localism for booking. The beuking consists simply of entering the names of the contracting parties in the Registrar's book for proclamation. If either party resiles from the contract, a fine of forty pounds Scots (£3, 6s. 8d. sterling) is exacted from the defaulter. From the time of the beuking until the marriage, which takes place a fortnight or three weeks later, the bridegroom, as he now comes to be named, never goes to sea in pursuit of his calling. In refraining from going to sea until the marriage, he is carrying out a fixed and established rule. In the interval there are many things to be done. The young man proceeds to purchase some few necessaries for himself and his bride, procures the little furniture required for their house, and generally makes arrangements for the stocking of the household. He invariably presents his bride with one or two requisites, in which custom appears never to allow him any latitude. A dress, a pair of boots, and a Paisley shawl or plaid of good dimensions, are procured for presentation to the young woman against her wedding day; and in these she is borne to the altar.

The beuking usually takes place on a Friday, and as a rule the invitations to the marriage are given upon the same evening. The invitations are issued in a simple and primitive manner. The bridegroom chooses a best-man and the bride a best-maid, and these two important functionaries, having received their instructions, proceed to bid the friends of the respective parties to the wedding. They go from house to house and verbally deliver their message, the best-man going to the bridegroom's friends and the best-maid to the bride's. Any one who receives an invitation of a later date, or by any other method, views it very much in the nature of a 'piper's bidding.'

A peculiar and somewhat oriental ceremony takes place on the evening before the marriage: this consists of the washing of the bride's feet.

A few of the girl's principal female friends only are invited to this ceremony; and although it is viewed as a solemn rite, without which the marriage would be incomplete and unlucky, yet it must be confessed that the ordeal is usually carried through with considerable levity and good-natured fun. The bride as a rule just dips her feet in the tub, and the washing is at an end. But the ceremony does not end there. The young woman, on the withdrawal of her feet from the tub, drops a ring and a shilling into the water, whereupon there is a struggle by the girls who are present for possession of these articles. The one who secures the ring will be the next to get married, and the finder of the shilling will have the most of this world's goods and gear. In the excitement and fun which ensue, there is a rush to the chimney for soot, and a general attempt at blackening each other's faces takes place. When the fun is at its height, an expected visitor is ushered into the room. This proves to be the bridegroom, who approaches the bride, and in a very matter-of-fact way hands her the pair of boots which he has purchased for her. Inside one of the boots there is a small present for the bride, consisting of seven or eight shillings in silver for her own particular use. Before the party breaks up, all present receive a general invitation to breakfast on the morrow—that is, the wedding day. Other verbal invitations to breakfast are also issued—some to the house of the bride's, and others to the house of the bridegroom's, parents. This concludes the ceremonies of the evening.

On Friday the marriage is celebrated. It is always on a Friday, which is a curious reversal of the popular superstition attaching to that particular day. The first important event of the wedding day is the breakfast, which goes on at the house of the bride's parents and at the house of the bridegroom's at the same time. The breakfast may occupy over an hour, and then the guests go home to dress for the wedding. The marriage guests proper are usually more numerous than those who have been invited to the breakfast.

The marriage invariably takes place in church, about one o'clock in the afternoon. Shortly before that hour the bride's invited guests begin to assemble at her parents' door and form into couples on the roadway. Then the bride issues forth with her best-man on one side and her best-maid on the other, and the three, arm-in-arm, take their places at the head of the guests. But the procession must be preceded by at least two married couples fairly advanced in years, and without them the company is not complete. With one or two married couples in the van there is good luck and omen. In this order, then, the procession wends its way to the church, two deep, and the couples arm-in-arm. When they reach the church, most of the guests take their seats near the officiating clergyman, with the bride and her best man and maid in the front pew. But a few of the party leave the building immediately the others are seated. The object of their doing so is to proceed to the house of the bridegroom and inform the party there that the bride is ready. Then the same order of procession of the bridegroom's party takes place—the bridegroom leaning on the arm of his best-

man on one side and of his best-maid on the other, and the whole company preceded by two or three married couples, as in the case of the bride's procession. The bride's guests meantime have been waiting in the church, doing nothing. There is nothing unusual in the ceremony performed by the clergyman; it is in the orthodox fashion.

When the ceremony is ended, the whole of the guests of both parties re-form in front of the church; and, with the four or five elderly married couples leading, the newly-married pair coming next, and the whole body of guests following, the company—consisting often of forty or fifty couples—marches back in procession to the house of the bride's parents. On the way, many of the party scatter coppers and sweets amongst the spectators on the roadway, and not infrequently special offerings are handed by the processionists to favoured onlookers. At the door of her parents' house, bread is broken on the head of the bride; and then the guests disband. Most of the women go into the house; and many of the men repair to a public-house to drink, on their own account, to the health of the newly-married couple. Outside the door of the house a crowd has collected, largely composed of children. To them are thrown offerings of currant cake and sweets, for which there is a general scramble, and much innocent fun is indulged in by the children, to whom a wedding is a great event.

In due time the minister who has married the young couple puts in an appearance, for to him falls the duty, at a fisher wedding, of cutting the marriage cake. The room in which the ceremony takes place is crowded with the guests of both parties, and refreshments are passed round. With much talk and many congratulations half an hour is pleasantly spent, and then the apartment is cleared, to make way for the laying of the dinner tables. In the interval the guests fill up the time as they please, usually in walking about the streets and greeting friends and neighbours. In the course of about an hour dinner is ready.

The dinner ceremony of a fisher wedding is a function peculiar unto itself. It goes on in two houses at the same time, the bride's party partaking of the meal at the table of her parents, and the bridegroom's party at that of his parents, just as in the case of the breakfast. As the married pair cannot be in two places at the same time, they give preference by custom to the bride's guests, and take up a prominent position at the dinner table. But it is doubtful if they always enjoy that dinner. Their freedom of movement is somewhat circumscribed. Whilst the other guests are enjoying their dinner in a rational manner, the poor young man and wife are penalised by the restrictions of a custom which is as inconvenient as it is unique. They are not each allowed a plate from which they can separately partake of the food provided. A plate of soup of which the first course consists is placed *between* them, and they are compelled to sup from it turn about, neither of them being permitted to take two spoonfuls in succession. The division of labour has to be equal and uniform. The effort is somewhat awkward for both parties, but it is performed in good-humour, and to the satisfactory fulfilment of an unwritten law which is more

binding than statutory enactment. The second course is served up in like manner to the first, and the young couple are again restricted to a joint supply on a single dish. The difficulty of eating from the same plate is even more marked in this instance than in the case of the soup supply. A spoon is not so difficult to handle as a knife and fork, and how they manage to wield the double instrument whilst eating from the same dish requires to be seen to be appreciated.

But while the second course is in progress, we arrive at an interesting stage of the feast. In the house of the young man's parents a similar meal has been proceeding. It commenced concurrently with the other, has been conducted on the same lines, with a similar supply of edibles on the table, and will occupy a similar space of time. But the second party has not been honoured with the presence of the young couple. Their patronage is required to complete the enjoyment of the dinner and the fulfilment of the marriage customs. Accordingly, the bridegroom's best-man and best-maid rise from their places in the middle of the second course, and make their way to the house where the young married pair are going through the ordeal of a public exhibition of unity. The two messengers, without ceremony, appear in the midst of the bride's guests and demand the presence of the young couple at the bridegroom's table. The request is never denied. It is part of the ceremony, and is carried out to the letter. They leave the table at which they have been endeavouring to fulfil an awkward part, proceed to the bridegroom's house, take the places reserved for them at the table, and proceed with their meal at the place where, at the other table, they left off! They are of course received with manifestations of pleasure, and at this table they finish their dinner, but under the same restricted formula as they were subjected to at the other.

The dinner, or rather the double dinner, occupies an hour or more of time, and when it is finished the guests of both parties disperse to amuse themselves about the streets as they see fit. By so doing they make room for another relay of guests, who, owing to the numbers invited, have been unable to find accommodation with the first relay. When these are satisfied, they in turn make way for the children—usually the children of the guests—and the little ones make a hearty meal of what is left of the supplies.

Two or three hours afterwards the guests again assemble at the respective tables, when high tea is partaken of. This meal is quite a function of the day's proceedings. By the time it is over the evening is pretty well advanced, and the hour is nearing for the inevitable dance. This dance might more fittingly be called a ball, so far as numbers are concerned, for it is not restricted to those who were bidden to the wedding. It is practically open to all the young men and maidens in the village, and many who have taken no part in the earlier proceedings of the day put in an appearance. A description of the dance with its attendant amusing features would occupy an article by itself. The dances are all of the 'country' character, and very brimful of humour are some of the scenes. Perfect decorum is maintained, but the dancing is generally

of a ramshackle kind, with much gesticulation and shouting. An old fiddler supplies the music.

Saturday is a comparatively quiet day with the marriage party; but there are a few ceremonies to be gone through. Many of the wedding guests are early astir, and make their way to the house of the young couple, who are informed by their visitors that it is time to rise from their slumbers. If they ignore the advice, it will be the worse for them. The intruders have a duty to perform—to carry them away to breakfast to the house of the young woman's parents—and that duty they intend to accomplish. As a rule they experience little opposition at the hands of the newly-married pair, who in due time are conducted to the breakfast table. Here a number of the guests of the previous day assemble. These friends have received a special invitation through the medium of the young woman's best-maid, and the invitation only extends to a favoured circle. Breakfast over, the young couple dress for a round of calls. They visit the guests who had been present at the marriage ceremonies, and receive at their hands, according to the ability of the several donors, a variety of presents; for amongst this fishing community the wedding gifts are presented after, and not prior to, the event which calls forth their generosity. The forenoon visits occupy many hours, and when these are at an end the young man and maiden rest from their labours until the following morning.

On the Sunday there are several important duties to be performed, and these are never overlooked. The husband and wife are up betimes, and for the first time in their married experience they are permitted to partake of a meal together, alone and unobserved. It must be a relief which they fully appreciate. After breakfast they dress with scrupulous care in their wedding garments, for they have to go through the 'kirking' ceremony with due formality and circumstance. No marriage is complete until this custom has been fully observed. The young man attires himself in the regulation blue-black suit most favoured by the villagers, puts on his white cotton marriage gloves, and carefully adjusts upon his head a tall satin hat. The hat is probably not his own, and, apart from the uncertainty of fit, he is unaccustomed to its use. But he must perforce wear it, and cheerfully adapts himself to use and wont. His wife is careful of her adornment, and seldom arrays herself in borrowed plumage. It is her husband's prerogative to provide his spouse with fitting apparel, and he is always faithful to his trust. In addition to the boots already referred to, she has received a bonnet of excellent design. The colours are sometimes pronounced, but not unduly, and as a rule the headgear is not devoid of taste. Her gown is also new and of good solid material. But the great feature of her clothing is the Paisley shawl, comparatively rich in substance, and of a pattern and texture which have become stereotyped in the village as the regulation design for newly-married women.

When the couple are ready and the time arrives, the husband's best-man at the marriage and the wife's best-maid arrive arm-in-arm at the door of the house, and the husband and wife immediately join them. In procession they march to church, the married pair leading the

way. The small company is watched with interest by many of the inhabitants, particularly by the younger villagers. But there is no demonstration. In procession they march up the aisle, and all four seat themselves in the pew which is henceforth to be occupied every Sunday by the young couple, who at this stage have practically settled down to their wedded life. There is no ceremony of any kind performed in the church. They just go through the service like the other worshippers. At its conclusion, the party must return in procession to the house whence they started, and with that the ceremony ends. The remainder of the day is observed as a day of rest. The evening service does indeed again claim their attendance, but the ordeal is not so formidable, and does not exercise their attention to the same extent as the forenoon ceremony. Thus on the evening of the fourth day the marriage rites come to an end. On the Monday all go about their usual vocations, and engage in their hard life's struggle for existence.

AUSTRALIAN SNAKE YARNS.

ALTHOUGH not so frequently met with, nor so deadly in their effects as the snakes of India, still, the snakes of Australia are a power sufficient to make their presence known and felt in every portion of it. They are occasionally found even in the most populous towns. In removing an old house in the centre of Sydney, a few years ago, a good specimen of the death-adder was discovered. It is not by any means an uncommon experience in the outskirts of a town to discover a snake in the wood-pile or under the veranda. Farther out in the country, they frequently appear in houses; and many instances are related of these creatures having been discovered in the bed of the settler. Such bedfellows, though coming only to enjoy the superfluous heat, are far from being pleasant companions, more especially if the human animal awakes before his reptile-friend has gone. During my protracted residence in the Bush, I have occasionally known of a bite having been received through some sudden movement of a restless sleeper. For, so long as the snake may be permitted to enjoy the heat of the body unmolested, so long will it remain passive, and share the bed quietly with its companion. Treated, however, to a sudden movement which threatens its worldly peace, the snake will retaliate by biting, and then endeavour to escape in the disturbance it has made. As a rule, snakes will use their utmost endeavours to escape from man. The fang of the snake is deadly, but the weapons of mankind are more so. It is only when hard pressed by necessity or fear of danger that a snake will strike at all. The desire to destroy a snake is far more deeply implanted in man than the desire to destroy man is implanted in the snake. When once seen, a snake is bound to be killed, if possible. This may be considered to be the first principle of a Bushman's creed, and thus, with the increase of population, these reptiles are being effectually exterminated.

Some of those snakes, too, of which we hear

the 'yarns' are perfectly innocuous. It by no means follows, then, that every snake we have heard about was a poisonous reptile; nor is it every bite that comes from a poisonous snake. A snake is, however, a snake; and a snake-bite is a snake-bite; so that every precaution is taken to kill the animal and to cure the patient, and that, too, whether the reptile is venomous or not. This caution is praiseworthy; but the doctors make capital out of the transaction, for almost every snake-bite with its result finds its way into the papers. By that time the reptile has developed into one of the most poisonous of snakes, and although 'killed by a well-directed blow,' it has acquired since its death at least three feet additional in length.

The snakes most common to Australia, naturalists tell us, are the brown snake, the black snake, the death-adder, the tiger-snake, the diamond-snake, and the carpet-snake. I don't say this list exhausts the series, but these I have seen and handled—after their death. Of these, the diamond and the carpet snakes are perhaps the most common, the most beautiful, and the largest. Fortunately, they are not venomous, although they will hiss and rear and bite exactly as the others. The death-adder is the shortest and smallest, but its bite is considered to be fatal. The tiger-snake is the fiercest, and very venomous. The brown and black snakes also inflict injuries, but these, under favourable conditions and with attention, may be cured. The wound given by a venomous snake is simply two small punctures, produced by the fangs. The wound produced by the bite of his non-venomous kinsman shows four or more punctures, made by the true teeth. The fangs of a venomous snake are two long teeth, having a canal passing down the centre of the tooth. At the base of this fang there is a little sac or cavity containing the poison. The fangs are ordinarily kept lying flat in the mouth, and are no more used for purposes of mastication than is the sting of a bee. In fact, snakes don't masticate. When the snake wishes to strike, the fangs are erected. Additional poison is secreted, and, as the fang is pressed against the limb or body 'struck,' the poison is pressed from the sac down the fang and into the wounds. The fangs are sometimes drawn by inducing the snake to strike a towel or other soft cloth, and then by a sudden jerk the fangs are absolutely torn out. They are not teeth. During the swallowing process the fangs are lying quietly in the mouth, and are not used at all. The peculiar construction of the skull of the snake enables it to take in the body of an animal very much larger than itself, and snakes always swallow their prey entire, leaving it to nature to digest the mass.

The aboriginal blacks when bitten rush into water, and having immersed themselves therein, remain there for a very considerable time. They say this is an effectual cure. The natives and the residents of these colonies tie ligatures above the wound, bleed, suck, cauterise, and amputate, according to the position of the bite. They also dose the patient with whisky, brandy, gin, gunpowder, pain-killer, ammonia, anything that is handy. The medical profession tries subcutaneous injection of morphia, ammonia, and other things simple and compound. Latterly, the profession

has attached much credit to strychnine administered as a remedy—not to assist the patient in his exit to 'that bourne.'

In the month of February, snakes are said to be in their most ferocious mood. It is stated that they will during that month commence the assault on a person without waiting to be attacked.

Snakes can run rapidly, but are easily killed when attacked properly. A single blow of a sapling, or even a whip-lash, will break a snake's back. After it has undergone this operation, it is positively powerless, being only able to wriggle. As a rule, when one is killing a snake, he does not take time to see the effect of his back-breaking blow. He has the creature in a pulp before he finishes. He usually draws up from shortness of breath, quite unable to continue the exercise longer. Many houses in the country have snake-sticks—long slender saplings—standing at known places round the house, so as to be handy when a snake shows up. 'For snakes only' might be written on these sticks, as 'For fire only' is written on the buckets standing in order in our large establishments. In killing a snake, great care must be used not to come up too close behind the reptile. On such an occasion it has the habit of throwing a back somersault like a circus clown and bringing its fangs into contact with your face. Many persons become so fearless that they will seize the most venomous snake by the neck, and kill it coolly with a stone or knife or against a tree. Others, catching the reptile by the tail, will swing it, and keep swinging it round the head, making the creature's head describe a circle, and so move about with it until a convenient opportunity offers for dashing its brains against a tree or rock. Such experiments may exhibit the performer's intrepidity of character, but at the same time they indicate a reckless foolhardiness that makes one shudder even to be a spectator.

But I have said so much about snakes, that my readers will think I have forgotten the promised yarns. The first which I shall mention I heard directly from a clergyman. He said it occurred to himself. It comes, therefore, stamped with truth. I tell it as nearly as possible in the language of my friend.

'My father had two farms: on one of these we resided; the other one we kept simply as a grazing farm. The distance from the one farm to the other was about twenty-five miles. One day my father sent my brother and myself to the distant farm to bring home some of the cattle. So we rose and started early, and by the afternoon we arrived at our destination. There was an old house on that farm which had been used by the late settler. We kept the door locked, and only used the house when our business led us to the other farm either for branding cattle, mustering them, or making repairs on fences. The roof was fairly water-tight, and we kept a sort of a rough bed in the kitchen, and an old blanket or two in a chest. Taking with us what provisions we required, we often camped here for a week at a time. On this occasion, however, we arrived in the afternoon, lighted our fire, got in a supply of wood, set our blankets to the fire, and made ourselves comfortable generally. Then we went out and rounded up the cattle, so as to have them handy for the morning; and

about eight o'clock we turned in, my brother and I sleeping in the same bed. You learn to turn in early in the Bush.

'Some time during the night I was awakened by something heavy pressing on my chest. Fortunately, I became conscious at once; and you may guess my horror when I perceived it was a snake, which had coiled itself like a watch-spring across my breast. It had crept in below the blankets, and was simply enjoying the heat without exhibiting the slightest concern as to the person from whom that enjoyment was obtained. To say that I became immediately conscious is to say that my blood ran cold. I had the satisfaction of knowing that as long as I remained still I had nothing to fear; but the moment I moved I was a dead man. And yet to lie still was torture. There was that horrible cold crawling snake lying a practical nightmare on my body. What was I to do? What I did was to reach over my hand and pinch my brother sharply.

"What are you doing?" he drawled, half sleeping.

"Archie, get up quietly and get a light. There's a snake lying coiled on my breast. Get up very quietly, man, or the thing will bite."

'Archie was all awake. He jumped out of bed, and was at the fire in "no time" with the lighted candle in his hand. Meantime the snake lay still, quietly enjoying the hot cushion on which it rested.

"What shall I do now? Are you sure it is a snake?"

"Certain. Get a stick, and be ready."

'Archie got one of the snake-sticks from the corner, and placing the candle on the table, awaited my further instructions.

"Now lift the clothes quietly. The brute will likely slip off. But I say, look here, Archie—don't strike at it till it is well off me."

'My brother threw off the blankets while I lay motionless, glaring at the deadly reptile coiled upon me. I declare its head was within eighteen inches of my own. Its eyes seemed burning fire.

'The snake looked up at the rough treatment which it was receiving and fastened its eyes on Archie. Then it raised its head, darted out its little forked tongue and hissed at him. It was just like a cat. Oh, it was terrible agony! My brother started back, while I lay like a log, bathed in a fearful perspiration. Suddenly it moved, and the next moment I experienced a great relief by feeling the horrible creature crawling off my body.'

'And the snake? I asked, hanging on the words of a man who had survived such fearful experiences. 'You killed him, of course; and what length was he?'

'Killed him—not at all. The creature got clean off. He ran like a rat, and escaped into a hole below the floor. We never saw him again; and I assure you I never wish to have any nearer acquaintance with the same gentleman.'

Mr. Richard Palmer lived in a beautifully situated cottage on the Macleay River. He had come out to the colony of New South Wales when a very young lad. He was the eldest son of his parents, and had been visited with a great misfortune: he had been born blind. However, his father had succeeded in business,

and he was enabled to leave Richard comparatively well off. The other members of the family were also very good to Richard, so that he was, as the world says, independent when he married and settled down on the Macleay.

One day Richard was walking in his little garden. In his right hand he carried a glass, in which one of his children had brought him some new milk to the arbour. His child Johnny—eight years old—held him by the other hand, and guided the father's steps. Suddenly the child cried out, 'A snake! a snake!' and dropping the father's hand, ran off towards its mother, who happened to be a spectator of the whole adventure. Mr. Palmer stood paralysed. He was perfectly incapacitated through his blindness to fight a snake, and the reptile was even now winding itself about his leg. The child had given him no indication of its whereabouts, and he was fearful of moving anywhere, lest he should tread upon it. The blind man therefore stood still, while Mrs. Palmer set up a shrieking and a clamour that called all the family around her. Suddenly he heard the angry hiss, and immediately a blow was struck with much force, which fortunately struck the glass that he carried in his hand. He stepped back involuntarily, and so released the snake, on the point of whose tail he had been standing all the time. The snake then disappeared among the plants and long grass, and Mrs. Palmer rushed forward to find her husband safe. Had the glittering glass not attracted the reptile, the probability is that it would have struck the man, and so brought about his death.

The above adventure was not Mr. Palmer's only snake-experience. On a former occasion he was sitting on his own veranda, his arm leaning on a little table beside him. On this table there was also a glass of milk. He was sitting in that silent way in which a blind man will rest for hours, when he suddenly became aware of some animal lapping the milk in the glass at his elbow. Thinking that it was the cat, Mr. Palmer reached out his hand to drive the animal away. One can conceive his horror when he found he had placed his hand fair on the cold body of a large snake. One may conceive his happiness when he heard the dreadful creature glide gently away without attempting to do him any injury. This snake was subsequently killed, and measured about seven feet in length. It belonged to the brown species, and owed its death to the unbridled fondness which all snakes have for milk.

As an illustration of how greatly snakes are realised, and how much their bite is dreaded, the writer will venture on one short narrative of an event which actually came within his notice.

Mrs. Peters went out one evening for some wood for the fire. The wood cut during the day was kept in a wood-box near the kitchen door. Her imprudence in not taking a light with her was shown by the speedy return she made within the door. Receiving a smart prick in her finger while she was scraping up a handful of the wood, she at once came to the conclusion that she had been bitten by a snake. The neighbours rushed in, attracted by her cries. They examined the wound, or what Mrs. Peters said was the wound. There was little or no visible mark, yet Mrs. Peters was most determined in her assertion.

She had been bitten by a snake, and she was going to die, no matter what the neighbours said to the contrary. One ran off for whisky, and another galloped into town for the doctor. The foolish but heroic woman would wait for none of these. She seized the tomahawk, and ordered her husband to cut off the top of her finger there and then. It was a piece of rude surgery, and the husband naturally objected. Still the woman persisted, and the poor husband was compelled to do as she directed. She spread out her fingers on the kitchen table, and the husband, after much entreaty, cut off the top of the luckless finger with one blow of the tomahawk. Ten minutes after, the writer saw the poor woman, now perfectly calm, with her finger-stump held in a bowl of water, and the severed tip lying on the table by her side. She was not growing sleepy or exhibiting other indications of snake-bite. The doctor assured me she had not been bitten by a snake at all, but had probably received a smart jag with a splinter of some sort. To this day, she attributes her life to her own prompt action. He would be a bold man, even now, who would dare to hint that the wound might have been caused otherwise than as she determined. Everybody else believes that she lost her finger through an injudicious mixture of foolish fancy and strong determination.

On one occasion, says another correspondent, I was walking with my wife over to the house of a neighbour, and to save ourselves a detour, we passed through a portion of the Bush that was generally very wet. It was known to be much frequented by snakes, and therefore generally avoided. Hearing a slight rustle below some brush, I looked in, and saw a sight which I had never seen before. A large snake had succeeded in securing a half-grown chicken, and was busily engaged in licking it all over, preparatory to swallowing it entire. I lay down on the ground beside it, and attentively watched the operation. My wife, who was less interested than I was, went on to the house of our neighbour, and sent me assistance in the shape of a man with a loaded gun. The snake seemed so intent upon its work that my presence did not disturb it in the slightest. It was very methodical, cementing all the feathers the one way, so as to let the bird glide naturally and easily down the contracted orifice of its throat. Having slimed the body to its satisfaction the snake proceeded to swallow it. This it did by commencing at the head of the fowl. The head and neck disappeared slowly, and with a sort of sucking-in motion. It would be almost more correct to say that the snake crept outside and round the fowl. The mouth was gaped so much over the head and neck, we wondered how ever it could take in the body of the fowl. The snake's jaws were quite equal to the occasion. They even seemed to be capable of a little more distension, and gradually—bit by bit, jerk by jerk—the chicken disappeared, and the snake appeared the greater. The legs of the chicken hung out last, and slowly followed the body. What seemed strange was that the throat, which had enlarged to admit the body of the fowl, was now tight even for its legs. I judge by this that the pleasure of eating in snakes must be in the direct ratio of the size of the food bolted. The legs also disappeared ;

and we could distinctly trace the shape of the entombed fowl passing down the body of the snake in the same slow manner as it had entered by its mouth. The process of the eclipse of the chicken lasted over an hour, from the first point of contact till it was completely hidden. When the free exhibition had afforded us all the amusement we were likely to receive, a shot from the gun brought the career of the serpent to a close. It was a carpet snake, and measured eleven feet seven inches from head to tail.

THE GLOW-WORM.

ONE of the most striking and comparatively rare sights that summer affords is to behold on the green mossy bank of some country lane, as night draws on, a multitude of gleaming lights like terrestrial stars, now glittering in their emerald setting and anon disappearing from view. This surprising spectacle to the townsman is readily understood by the dweller in the country, who knows that these bright points 'glowing like night-tapers with beauty' are but glow-worms, and who perhaps is able to capture for us one or more of these interesting creatures.

Other and especially tropical lands possess many specimens of light-giving insects ; there 'the fireflies dance through the myrtle boughs ;' but the glow-worm is almost our sole representative of luminous animals. The Rev. J. G. Wood, the veteran naturalist, in his admirable book on *Common British Insects*, says : 'It is fortunately very plentiful in this country ;' but if this be true, it cannot apply to the north of England or to Scotland, for, though there are spots where, on some warm evening in July or August, they may be seen lighting up the shady glade, yet there are wide districts, probably whole counties, where they have never yet been observed. In Essex, Kent, the Isle of Wight, and similar localities, in sheltered, slightly-damp places, the glow-worm's greenish-blue lamp may be oft observed shining among the grass or leaves. Many a greenwood legend is associated with its bright twinkling light ; it often brings to mind

Those fairy elves
Whose midnight revels by a forest side,
Or fountain, some belated peasant sees—
Or dreams he sees ; while overhead the moon
Sits arbitress, and nearer to the earth
Wheels her pale course.

When a colony is thus seen in some damp shady lane, overhung with trees and bordered by green sloping banks, the effect produced is very beautiful. They look like tiny lamps in the soft moss, and afford the naturalist a subject for contemplation as to the chemistry and mechanism by which such a delightful result is brought about.

The animal belongs to the Malacodermata, or Soft-skinned Beetles, all of which have a flexible exterior, and are usually covered with a very short and delicate down. The species is termed *Lampyridæ*, from two Greek words signifying 'shining tail ;' and the English example—for there are many in the family—has the special name *Lampyris noctiluca*, the last word being Latin for 'night-light.' The sexes differ much in appearance. The female possesses neither

wings nor elytra (wing-sheaths); the head is concealed under a large and rounded prothorax; the male has large wings and elytra that cover the whole body. He is less in size than his mate; one writer calls him 'a slender scarabæus.' He is difficult to meet with, and is therefore regarded as a prize by the entomologist who is lucky enough to effect his capture. Both sexes have the power of emitting light; the lamp of the female being, however, much brighter than that of the male. Instead of a mass of phosphorescence throwing a radiance of some inches in extent, such as the female exhibits, he has but two tiny spots of light no larger than pinheads, which he displays in flying. It was formerly thought that he had no light-giving faculty; but this has been proved to be a mistake. The female also possesses the singular power of shutting off or being able to conceal her light on the approach of nocturnal birds or of footsteps. She can also trim her lamp to an unwonted brilliancy, but generally extinguishes it altogether about eleven or twelve at night. Shakespeare, whose knowledge of the natural world excites our wonder, and who never missed an opportunity of using an illustration therefrom, makes his Ghost in *Hamlet* say:

The glow-worm shows the matin to be near,
And 'gins to pale his ineffectual fire.

When examined in the dark, the light is seen to proceed from the last three segments of the insect's body, the under side of which emits it in an uncertain wavering sort of way, the fact of its being handled seeming to alarm the insect. Schultze found that the animal possessed thin whitish plates on the under side of these segments, each plate consisting of two layers—a front one, yellowish transparent and luminous; and a back one, white and opaque from the presence of a great multitude of doubly-reflecting granules which Kolliker supposes to consist of urate of ammonia. He also found that branches of the insect's breathing-tubes (tracheæ) ramify among the cells of the front layer, and end in star-like corpuscles.

So much for the structure of the luminous apparatus; but as to the cause of the luminosity there is a variety of opinions. Some savants hold that it is due to a sort of natural combustion, and it is said that if a glow-worm be placed in oxygen, the light is greatly intensified for a time; but the animal seems either unable or unwilling to continue it. On the other hand, when Matteucci placed it in hydrogen and carbonic acid—gases which do not support combustion—the light still continued to be emitted for thirty or forty minutes. Phosphorescent undoubtedly is its nature, and that is about all that science can at present affirm. As to the object of this display authorities differ. The common idea has always been that it is intended as a signal between the male and his mate.

One naturalist (Ackroyd) writes: 'The light of this little organic lamp illuminates the insect's path, and probably discloses to its minute and sensitive eyes that of which it is in quest, although at times it may be a source of danger, as when it serves as a mark for some voracious bird which, like Cowper's nightingale, is in want of a supper.'

Again, some have thought it is connected with the reproductive faculty, and one scientist affirms, we do not know with what truth: 'As soon as the female has deposited her eggs—which, by the way, shine in the dark—the light disappears in both sexes.' But we are inclined to believe no utilitarian theory will account for this singular development of light from a living insect, and that its phosphorescence was given to it for the same reason that the butterfly's wing glows with many-coloured plumage, and that the rose is dowered with softly tinted petals and rich perfumes.

Not only is this beetle interesting to the entomologist, but it is useful, especially in its larval state, to the farmer. Neither old nor young touch plants as food, but feed on decayed worms and snails, attacking and devouring the latter when still alive, their shells being no protection to the luckless molluscs. The structure of the larva is rather remarkable. In the first place—which is very unusual—it bears a singular resemblance to the imago or perfect female insect; and in the next it is furnished with a peculiar apparatus at the end of the tail, which serves a double purpose—namely, assisting its locomotion, and acting as a brush to remove the slime from its food, and this apparatus can be protruded or withdrawn at will.

SHADE AND SHINE.

AWAY to the Westward the swift ship is sailing,
In cloud-wreath and mist sets the tremulous sun;
From ocean and shore the dim twilight is failing;
The darkness and shadow of night are begun.
Oh sea-birds! sweep on, with your cry wild and wailing;
Break shoreward, oh waves! with your desolate moan;
Away, with the light slowly waning and paling,
My love saileth Westward—my loved one is gone.

Aglow from the sunrise, the gay bark comes dancing;
Red flushes the ocean, the sky blushes bright;
The gleam and the glory of daylight advancing,
Drive backward the shadow and darkness of night.
Oh wave! kiss the shore with caresses entrancing;
Oh bird! catch its music in swift-winged flight;
Right over the laughing sea, glowing and glancing,
He cometh, my loved one—he cometh, my light!

TEETH AND TOOTHACHE.

OF teeth it may be said that that man is happiest who is unconscious of them. We do not mean as an ornament. It is true that some peoples, as Montaigne says, 'take great care to black their teeth, and hate to see them white; whilst others paint them red.' Europeans have a taste of their own in the matter, and love to see them white. For proof consult contemporary fiction *passim*, where even the villains have a fine set to show, and know it. Let Herrick sing of the rubies and pearls of his Julia's mouth; teeth for the present purpose are not jewels. They are to be regarded as the 'fons et origo mali,' and that evil is toothache.

Toothache is as old as sin, and as universal. To erring man it might figure as a form of final torture. It must have been part of the punishment of our primeval parents, whose doom we inherit. The first that an infant knows of teeth is pain; from the cradle to the grave they are an active source of annoyance. Some there be, indeed, who say not without pride that they never had a touch of toothache in their lives. But call not a man happy till he is dead. Hereafter writhing in anguish, they shall assuredly repent the premature boast. And there are strong men and the like who misuse their teeth to lift surprising weights, or, emulating that terror of the Spaniards and hero of the *Revenge*, Sir Richard Grenville, chew glasses up without a grimace. 'Blind mouths' (to pervert Milton's phrase), they do not look to the end—the fevered gums, the dull unceasing ache, the shooting spasm, as if a red-hot needle were thrust into the brain. If a man does altogether escape the fell disease, one is tempted to ascribe to him a low order of nervous organisation. He must be 'only an animal, only sensible in the duller parts.' Nay, he is even lower than that, for animals, too, have toothache, and especially such as possess a high degree of intelligence. The dog and the horse are well-known sufferers. On the authority of a quaint old French book on the subject,

we may add the wolf; and the hippopotamus 'endures quite a great pain from its teeth, so that it is constrained to get out of the water to find a remedy.'

This book is one of the earliest modern authorities on toothache that we have discovered. It is scientific, as science went in 1622. Its author, one Maistre Arnould Gilles, was apparently court dentist, for he dedicates his book to Marie Henriette de Bourbon, sister to the reigning king; and it is published at the appropriate sign of the Three Golden Teeth, in Paris. It is remarkable, we may say in passing, that the literature of toothache is so meagre. An ailment of such ancient standing in the world's history might be expected to obtain more frequent and detailed notice. Such modern treatises as exist are purely technical, and undeserving of the name of literature. There is in them nothing historical, nothing human and sympathetic to the view of the sufferer. Even in the ordinary life of to-day there is no disease which gains us so little pity from our friends. It is not fatal, they say, and are apt to be impatient with our groans. And we ourselves, once the attack is over, straightway forget what manner of torture it was, and go unthinkingly about our daily business. Now, this is surely wrong. It may be true that toothache never killed anybody directly; but assuredly, if analogy goes for anything, it has been the cause of crime and death. Imagine an absolute monarch with an obstinate tooth. It would be a grim amusement to him, almost a necessity, to sign a death-warrant. There have been martyrs to toothache in another than the ordinary usage of the term.

But to return to Maistre Arnould. The first thing to note is that he advises the specialisation of dentistry. 'It is very necessary that dentists should have no other vocation.' He has known instances where patients have died from hemorrhage because the ignorant drawer of teeth did not know how to stop the bleeding. The world, he says, by way of peroration, may think the title 'Drawer of teeth' strange, and perhaps

despise it. But Maistre Arnauld glories in it as very useful to the public, 'and does not do, like an infinity of others, who, coming to this town [of Paris], call themselves Grand Operators. He is happy to do his task well, to take the little fee that is given him, and is never ill-content.' It is only lately that in England the Royal College of Surgeons recognised dentistry as a special branch of medicine. Some twenty-five years ago their dental certificate was established. Before that, the craft was confined to tooth-drawing mainly, and had for its professors the local barber, blacksmith, or watchmaker. We are now beginning to see that unlicensed practitioners do a lot of mischief. The ancient Egyptians were before us in this field; for Herodotus tells us that no doctor in Egypt was permitted to practise any but his own peculiar branch, and some attended solely to diseases of the teeth. Proofs of their skill have been found in some mummies at Thebes whose teeth were stuffed with gold.

So much for the disease; but what of the cure? Maistre Arnauld gives several prescriptions, but they are commonplace compared with more ancient remedies. Here are two methods from Pliny: Put your hands behind your back; bite off a piece of wood from a tree which has been struck by lightning, and apply it to the ailing tooth. Or you may fumigate the tooth with the tooth of another of the same sex—how that is done we are not told—and bind the canine tooth of an unburied corpse to it. Habbdarrahman on Egyptian medicine advises that the molar of a dead man—whether buried or not apparently does not matter—be hung over the groaning sufferer, and the pain will abate. Others, again, say: 'Burn a wolf's head and keep the ashes. They are a great remedy.' It is difficult to cap the piquancy of such cures; but Sir Thomas More has done it; and his prescription has the advantage of not requiring such inaccessible materials. 'I have heard it taught me,' he says in 1557, 'for the toothache to go thrice about a churchyard and never think on a fox's tail.' This reminds one in its malicious pleasantry of 'Don't nail his ears to the pump;' for the suggestion of foxes' tails in connection with churchyards, though not very obvious to the common man, must always and inevitably recur to those who tried the cure.

The man in dental anguish sometimes curses with Burns 'the venom'd stang that shoots his tortured gums along.' Sometimes, on the other hand, he prays. St Augustine in his *Confessions* relates how he once suffered from 'dolor dentium' (toothache), apparently in an aggravated form, for he could not speak. Thereupon, he wrote on wax a prayer to God for the other brethren to repeat; and as soon as all were on their knees the pain went. 'But what a pain!' he says—'never since my tender age had I experienced the like.' Southey, in his *Life of John Wesley*, tells of that eminent preacher that when his own tooth ached he prayed, and the pain left him. Unfortunately, ordinary men do not seem to have such efficacious faith. When the excruciation begins they must bear it philosophically; and on Shakespeare's authority toothache finds out just the weak place in the philosopher's armour of patience. In the middle ages the devout who

were racked with pain had a special patron to whom they could call for deliverance. St Apollonia, a martyr under the Emperor Philip, among other cruel indignities had her teeth pulled out. In consequence, she became toothache's tutelary saint, as her emblems—one of which is 'holding a tooth in pincers'—sufficiently testify. And there would seem to have been yet another martyr, St Blaize, who took cognisance of the disease. He was honoured in the little town of St Blazey, in Cornwall, where candles offered upon his altar were supposed to be an infallible cure for toothache.

Perhaps something may be added on the subject of toothpicks. These are said to have been invented in Italy. Certainly they were in common use among the Romans. In Martial's Epigrams there are frequent references to the 'denticulipium,' sometimes reviling its abuse, sometimes praising its use. The particular form of toothpick which Martial preferred was a pointed strip of mastic-wood; but, in default of that, he recommends a quill. Singularly enough, the useful instrument was regarded as an innovation in Queen Elizabeth's time. The Bastard, in *King John*, sneers at

Your traveller—

He and his toothpick at my worship's mess.

Travellers in France and Italy, it seems, brought toothpicks back, and used them ostentatiously; and all those who affected foreign fashions sedulously imitated them. Commonly a case of toothpicks made of wood was carried about by fine gentlemen. A more violent eccentricity of fashion is pointed at by Sir Thomas Overbury, who describes a courtier as walking in St Paul's 'with a picktooth in his hat, a cape cloak, and a long stocking.' Apparently the 'Johnny' of the present day, who is so unremitting in his use of the homely quill, has inherited the toothpick and his flourishing display of it from the coxcombs that thronged the court of the Virgin Queen.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXIII.—THE THREE ACCOMPLICES.

ON that same evening the three accomplices—probably on the proceeds of their iniquities—were dining together at the *Savoy*. After dinner they sat on the veranda overlooking the river and the Embankment. 'Tis sweet, what time the evening shades prevail, while one is still in the stage of physical comfort and mental peace attendant upon an artistic little banquet, to view from the serene heights of a balcony at that hotel the unquiet figures of those who flit backwards and forwards below. They—alas!—have not dined so well, or they could not walk so fast, or drag their limbs so hopelessly, or lean over the wall so sadly.

Elsie leaned her head upon her hands, looking down upon this scene, though not quite with these

thoughts. Young ladies who are quite happy, and are going to be married next week, do not make these comparisons. Happiness is selfish. When one is quite happy, everybody else seems quite happy too—even Lazarus and the leper. We must never be happy if we do not wish to be selfish.

Coffee was on the table. Athelstan had a cigar. They were all three silent. During dinner they had talked gaily, because everybody knows that you cannot talk with strange people listening. After dinner they sat in silence, because it is only when the waiters are gone that one is free to talk.

'Elsie,' said George presently, 'you have something to tell us—something you have discovered. For my own part, since I handed the case over to anybody else, I feel as if I were not interested in it. But still, one would like to know—just for curiosity's sake—when Checkley is to be "run in."'

'Yes,' said Elsie, 'I must tell you. Perhaps I ought to have told you before. Yet there was a reason. Now—you will be greatly astonished, George.'

'Before you begin, Elsie'—Athelstan removed his cigar—'I must tell you that yesterday evening I, too, made a discovery—what the Americans call a pivotal discovery—a discovery that discovers everything. I should have told you last night, but you announced your communications for this evening, and I thought we would expose our discoveries at the same time.'

'You have found out, too!' Elsie cried. 'I see by your face that you have. Well, Athelstan, so much the better. Now, tell your discovery first, and I will follow.'

'It is this. I have discovered Edmund Gray. I have sat with him and discoursed with him, in Freddy Carstone's Chambers. He came in, sat beside me, and conversed for more than an hour.'

'Oh!' said Elsie. 'Then you know all—as much as I know.'

'Observe,' George interposed, 'that I know nothing as yet.'

'Wait a moment, George. Learn that I have myself known Mr Edmund Gray for a fortnight. You will think, perhaps, that I ought to have told you before. Well—but there is a reason—besides, the way, to begin with, did not lie quite clear before me. Now the time has come when you should advise as to the best course to follow.'

'You have certainly been more mysterious than any oracle, Elsie. Yet you will bear witness, if it comes to bearing witness, that I accepted your utterances and believed in them.'

'You certainly did, George.—And now, Athelstan, tell him the whole.'

'In one word, then—Edmund Gray, the man we have been looking after so long, is none other than Edward Dering, of 12 New Square, Lincoln's Inn, Solicitor.'

'I don't understand,' said George, bewildered, 'Say it all again.'

Athelstan repeated his words.

'That is my discovery, too,' said Elsie. 'Now you know all, as you understand.'

'But I don't understand. How can one man be another man?'

'I sat beside one man,' Athelstan added, 'for an hour and more; and lo! all the time he was another man.'

'And still I am fogged. What does it mean?'

'It means, George, what you would never suspect. The one man received me as a stranger. He knew nothing about me: he had never heard my name, even. Yet the other man knows me so well. It was very odd at first. I felt as if I was talking to a sleep-walker.'

'Oh!' cried George, 'I know now. You have seen Mr Dering in a kind of sleep-walking state—I too have seen him thus. But he said nothing.'

'You may call it sleep-walking if you like. But, George, there is another and a more scientific name for it. The old man is mad. He has fits of madness, during which he plays another part, under another name. Now, do you understand?'

'Yes—but—is it possible?'

'It is more than possible; it is an actual certainty. Wait. Let Elsie tell her story.'

Then Elsie began, with a little air of triumph, because it is not given to every young lady to find out what all the men have failed to find.

'Well—you see—I was always thinking over this business, and wondering why nothing was found out about it, and watching you look this way and that, and it occurred to me that the first thing of all was to find out this Mr Edmund Gray and lay hands upon him. At first I thought I would just go and stand outside his door all day long and every day until he came. But that seemed a waste of time. So I remembered how you found his door open, and went in and spoke to the laundress. I thought that I would do the same thing, and sit down there and wait until he should come. But I was afraid to sit in the rooms of a strange man all alone—no, I could not do it. So I just found out the old woman—the laundress—as you did, George, and I gave her money, and she told me that Mr Gray was at his Chambers almost every Saturday afternoon. Very well; if anybody chose to wait for him all Saturday afternoon, he would certainly be found. So on Saturday afternoon I took a cab and drove to Holborn, and got to the place before his arrival. But again, as it was not quite nice to stand at an open doorway in a public Square, I thought I would wait on the stairs. So I mounted—the doors were all closed—nobody was left in the place at all—I thought I should be perfectly safe and undisturbed, when I heard the noise of footsteps overhead—a tramp, tramp, tramp up and down, with every now and then a groan—like a hungry creature in a cage. This kept on for a long time, and frightened me horribly. I was still more frightened when a door overhead opened and shut and the footsteps came down-stairs. They belonged to a man—an elderly man—who seemed as much frightened at seeing me as I was at seeing him. He asked me whether I wanted any one; and when I said I wanted Mr Edmund Gray, he said that he was a friend of Mr Gray's, and that, since I was a friend too, I might act for Edmund Gray and lend him some money. He looked desperately poor and horribly hungry and thin and shabby, the poor old man!'

'So you acted for Edmund Gray. That was old Langhorne. He is a barrister, who lives in the garret, and is horribly down on his luck.—Go on.'

'Poor Elsie!' said George. 'Think of her, all alone on the staircase!'

'When he was gone, there was no sound at all. The place was perfectly quiet. The time passed so slowly—oh! so slowly. At last, however, I heard a step. It came up the stairs. Oh! my heart began to beat. Suppose it should be Mr Edmund Gray. Suppose it was some other person. Suppose it was some horror of a man! But I had not long to wait, because Mr Edmund Gray himself stood on the landing. He stared at me, rather surprised to find a young lady on the stairs, but he showed no sign of recognition whatever. I was a complete stranger to him.'

'And was the man Mr Dering?'

'He was—Mr Dering. There was just the least little change in him. He wore his coat open instead of buttoned. He had no gloves, his hat was not pulled over his eyes, and his face was somehow lighter and brighter than usual.'

'That is so,' said Athelstan. 'Exactly with these little changes he presented himself to me.'

'Perhaps there is another man in the world exactly like him.'

'Futile remark!—Go on, Elsie.'

'Then I guessed in a moment what it meant. I stepped forward and asked him if he was Mr Edmund Gray. And then I followed him into his rooms.—George, there is no manner of doubt whatever. Mr Dering has periods, whether regular or not I cannot tell, when he loses himself and becomes in imagination another man. He is mad, if you like, but there is method in his madness. The other man is just himself turned inside out. Mr Dering believes in the possible wickedness of everybody: the other man believes in the actual goodness of every man. Mr Dering considers Property the only stable foundation of society: the other man considers Property the root of all evil. Mr Dering is hard and jealous: the other man is full of geniality and benevolence. Mr Dering is Justice: the other man is Mercy.'

'Very neatly put, Elsie. There is quite an eighteenth-century balance about your sentences and sentiments. So far'—Athelstan contributed his confirmation—'So far as I could judge, nothing could be more true. I found my man the exact opposite of himself.'

'Can such a thing be possible? If I were to speak to him, would he not know me?'

'You forget, George. You have seen him in that condition, and he did not know you.'

'Nothing is more common'—Athelstan the Journalist began to draw upon the encyclopædic memory which belongs to his profession—'than such a forgetfulness of self. Have you ever been into a Lunatic Asylum? I have—for professional purposes. I have discoursed with the patients, and been instructed by the physicians. Half the time many of the patients are perfectly rational: during the other half they seem to assume another mind with other memories. It is not real possession, as the ancients called it, because they never show knowledge other than what they have learned before. Thus, a sane man who cannot draw would never in insanity become an artist. So Mr Dering,

when he is mad, brings the same logical power and skill to bear upon a different set of maxims and opinions. Said a physician to me at this asylum of which I speak: "There are thousands of men and women, but especially men, who are mad every now and then, and don't know it. Most of the crimes are, I believe, committed in moments of madness. A young fellow steals money—it is because at the moment he is so mad that he even persuades himself that borrowing is not stealing: that he is only borrowing: that he can get it back, and put it back, before it is found out. What is uncontrollable rage but sudden madness? There are the men who know that they are mad on some point or other, and cunningly hide it, and are never found out. And there are the men who are mad and don't know it. In their mad times they commit all kinds of extravagances and follies, yet somehow they escape detection." So he talked; and he told me of a man who was a lawyer in one town with a wife and family, and also a lawyer in another with a different wife and family. But one lawyer never found out the other; and the thing was only discovered when the man got a paralytic stroke and died in a kind of bewilderment, because, when the time came for him to be the other man, he found himself lying in a strange bedroom with a strange family round him. I had long forgotten the asylum. I did the place for my paper three or four years ago, and scored by the description. Since last night I have been recalling my experience and applying it. You see there can never be any physical change. This is no Hyde and Jekyll business. Whatever happens must be conducted with the same body and the same mind. The same processes of mind in which the man is trained remain, but his madness requires a new setting.'

'One cannot understand,' said Elsie.

'No. But then one cannot understand everything. That's the real beauty of this world: we are planted in the midst of things: we can give names to them—Adam began that way, didn't he?—but we can't understand any of them; and most people think that when we have given a name we have succeeded in understanding. Well, Elsie—we don't understand. But we may find out something. I take it that the other man grew up by degrees in his brain, so that there is no solution of the continuity of thought and recollection. The Edmund Gray developed himself. He has been developed for nearly ten years, since he has occupied the same Chambers all the time.'

'But about the forgeries?' George sprang to his feet. 'I declare,' he cried, 'that I had quite forgotten the real bearing on our case.'

'Edmund Gray,' said Elsie, 'says that his own lawyer who manages his affairs is Edward Dering. If he were to write letters while Edmund Gray, he would not impose upon Edward Dering.'

'He cannot write to two men,' said Athelstan. 'There must be a border-land between the waking and the dreaming, when the two spirits of Edmund Gray and Edward Dering contend for the mastery, or when they command each other—when Edmund Gray endorses cheques and Edward Dering writes letters and conducts transfers for his client—his double—himself.'

'I have seen him in such a state,' said George. 'At the time I never suspected anything but a

passing trouble of mind, which caused him to be so wrapped up in his thoughts as not to be able to distinguish anything. He was then, I doubt not now, carrying out the instructions of Edmund Gray, or he was Edmund Gray acting for himself. Checkley whispered not to disturb him. He said that he had often seen him so.'

'I have never tried to understand,' said Elsie. 'But I saw that Edmund Gray was Mr Dering gone mad, and that he himself, and nobody else, was the perpetrator of all these forgeries; and I have been trying to discover the best way—the kindest way to him—the surest way for us, of getting the truth known.—George, this is the secret of my mysterious movements. This is why I have not given you a single evening for a whole fortnight. Every evening—both Sundays—I have spent with this dear old man. He is the most delightful—the most gentle—the most generous—old man that you ever saw. He is full of ideas—oh! quite full—and they carry you out of yourself, until you awake next morning to find that they are a dream. I have fallen in love with him. I have had the most charming fortnight—only one was always rather afraid that he might come to himself, which would be awkward.'

'Well, Elsie, have you found a way?'

'I think I have. First, I have discovered that when he is surrounded with things that remind him of Edmund Gray, he remains Edmund Gray. Next, I have found out that I can, by talking to him even at his office, when he has his papers before him, turn him into Edmund Gray.'

'You are a witch, Elsie.'

'She is,' said George, looking at her in the foolish lover's way. 'You see what she has turned me into—a long time ago, and she has never turned me back again.'

'I have been thinking too,' said Athelstan. 'For our purposes, it would be enough to prove the identity of Edmund Gray and Edward Dering. That explains the resemblance of the handwriting and of the endorsement. My commissioner's recollection of the man also identifies the cheque as drawn by himself for himself under another name. It explains the presence of the notes in the safe. It also shows that the long series of letters which passed between him and the broker were written by himself for himself. Here, however, is a difficulty. I can understand Edward Dering believing himself to be Edmund Gray, because I have seen it. But I cannot understand Edward Dering believing himself to be the Solicitor to Edmund Gray and writing at his command.'

'But I have seen him in that condition,' said Elsie. 'It was while he was changing from one to the other. He sat like one who listens. I think that Edmund Gray was at his elbow speaking to him. I think I could make him write a letter by instruction from Edmund Gray. That he should believe himself acting for a client in writing to the broker is no more wonderful than that he should believe himself another man altogether.'

'Show me, if you can, the old man acting for an imaginary client. Meantime, I mentioned the point as a difficulty. Prove, however, to Mr Dering and to the other concerned that he is Edmund Gray, and all is proved. And this we can do by a host of witnesses.'

'I want more than this, Athelstan,' said Elsie. 'It would still be open to the enemy to declare that George, or you, or I, had made use of his madness for our own purposes. I want a history of the whole case written out by Edmund Gray himself—a thing that we can show to Mr Dering and to everybody else. But I dread his discovery. Already he is suspicious and anxious. I sometimes think that he is half conscious of his condition. We must break it to him as gently as we can. But the shock may kill him. Yet there is no escape. If the forgeries were known only to ourselves, we might keep the discovery a secret; and only, if necessary—but it would not be necessary—keep some sort of watch over him and warn the Bank. But Checkley has told the clerks and the people at the Bank, and there are ourselves to think of, and my mother and Hilda.—No; we must let them all know.'

'And if one may mention one's self,' said Athelstan, 'my own little difficulty presses. Because, you see, I don't know how long I may be kept here. Perhaps to-morrow I might go on to St Petersburg or to Pekin. Before I go, Elsie, I confess that I should like my mother to understand that—that she was a little hasty—that is all.'

'You are not going to St Petersburg, brother.' Elsie took his hand. 'You are not going to leave us any more. You are going to stay. I have made another discovery.'

'Pray, if one may ask'—

'Oh! you may ask. I saw a letter to-day—Mr Dering showed it to me. It was written from the States three or four years ago. It showed where you were at that time—and showed me more, Athelstan—it showed me how you lost the pile of money that you made over that silver mine—you remember, Athelstan?'

He made no reply.

'Oh! do you think that I am going to accept this sacrifice?—George, you do not know. The donor of that great sum of money which Mr Dering held for me—we have often wondered who it was—I have only found out to-day—it was Athelstan. He gave me all he had—for such a trifling thing—only because I would not believe that he was a villain—all he had in the world—and went out again into the cold. He said he dropped his money down a gully or a grating on the prairie—some nonsense. And he sent it all to me, George.—What shall we do?'

'Is this really true, Athelstan? Did you really give up all this money to Elsie?'

'She says so.'

'It is quite true, George. I saw the letter—Mr Dering showed it to me—in which he sent that money home, and begged Mr Dering to take care of it, and to give it to me on the day when I should be one-and-twenty. He cannot deny it. Look at him. He blushes—he is ashamed—he hangs his head—he blows tobacco-smoke about in clouds, hoping to hide his red cheeks. And he talks of going on to St Petersburg, when we know this secret, and have got the money! What do you call this conduct, George?'

'Athelstan—there is no word for it. But you must have it back. You must, and shall. There can be no discussion about it. And there is not another man in the world, I believe, who would have done it.'

'Nonsense. I should only have lost it, if I

had kept it,' Athelstan replied after the Irish fashion.

'You hear, Athelstan. It is yours. There can be no discussion. That's what I like a man for. While we women are all talking and disputing, the man puts down his foot and says: "There can be no discussion." Then we all stop, and the right thing is done. It is yours, brother; and you shall have it, and you shall stay at home with us always and always.' She laid her hand upon his shoulder, and her arm round his neck, caressing him with hand and voice.

The man who had wandered alone for eight years was not accustomed to sisterly caresses. They moved him. The thing itself moved him.

'All this belongs to another chapter,' he said huskily. 'We will talk of it afterwards, when the business in hand is despatched.'

'Well, then—that is agreed. You are to have your money back: my mother is to take her suspicions back: Mr Dering is to have his certificates back and his dividends: Checkley is to take his lies back: Sir Samuel is to have his charges back: George and I are going to have our peace of mind back. And we are all going to live happy ever afterwards.'

'As for Wednesday now,' said George. 'It is not an unimportant day for us, you know.'

'Everything is ready. On Sunday morning my mother is always at home before Church. I will see her then, and acquaint her with the news that the wedding will take place as originally proposed, at her house. This will astonish her very much, and she will become angry and polite and sarcastic. Then I shall tell her to prepare not only for a wedding feast but also for a great, a very great surprise. And I shall also inform her that I shall be given away by my brother. And then—then—if I know my mother aright, she will become silent. I shall do that to-morrow morning.—In the evening, George, you will get your best-man, and I will get your sisters, my bridesmaids, and we will come here, or go to Richmond or somewhere—and have dinner and a cheerful evening.—Am I arranging things properly?'

'Quite properly. Pray go on.'

'Sunday afternoon I have promised to spend with my master—Edmund Gray. He is going to read me a new Paper he has just finished, in which he shows that Property can be destroyed by a painless process.—Athelstan, put all your money into your pocket and keep it there—in less than a twelvemonth, and with it all crime—all sweating, all injustice.—No, Athelstan, he is not mad. When he argues on this theme he is persuasive and eloquent. He convinces everybody. I shall hear him out, and then I shall try to make him write down all that has happened. If we can only get such a confession, it would be better than anything else. But it may be difficult. He does not like being questioned about himself. If I do succeed—I don't know quite what I ought to do next. He must be told. Some time or other he must have the truth. I thought of asking all the people mentioned to meet at his office on Monday morning at noon when Mr Dering is always himself. On Sunday I would not. He has to address his people on Sunday evening. Let him do so undisturbed. I will leave him in happiness that one night

longer. But you two—you will be anxious. Come on Sunday evening—between eight and nine—to the Hall of Science. Then you will hear him and see me. And I will let you know how I have prospered.'

'Sunday evening,' said George. 'Monday comes next, then Tuesday, and before Wednesday, my Elsie, the character of these two convicts has to be completely whitewashed, even to the satisfaction of Hilda herself. Are we not running it pretty close?'

'Unbeliever! Doubter! I tell you that you shall be married with all your friends round you, and that Athelstan shall give me away. And you shall go away on your holiday with a quiet heart and nothing to trouble you. What a foolish boy not to be able to trust his bride even for such a simple thing as getting a confession out of a madman!'

'Do you sport a crest, old man?' asked Athelstan.

'I believe there is some kind of a sort of a thing somewhere around. But crests are foolishness.'

'Not always. Take a new one, George—a real one. Stamp it on your spoons and forks and in your books and on your carriage. Let it be simply the words, "Dux Femina Facti."'

(To be continued.)

THE ENFIELD SMALL-ARMS FACTORY.

SOME little time back we gave in the pages of this *Journal* a short account of Woolwich Arsenal (No. 380, April 11, 1891), where are manufactured ordnance of all sizes and classes, from the light field-gun of the Royal Horse Artillery to the huge monsters known as 'Woolwich Infants,' or by some such fanciful name. But, as every one knows, weapons of this character are quite in a minority as compared with those which are carried by the soldier himself, and form his personal weapons whether as an infantry or cavalry man. It is at Enfield, on the river Lea, some twelve miles down the Great Eastern Railway, that these weapons are manufactured, almost entirely, as required by our army.

Enfield Factory has not, like Woolwich Arsenal, an ancient history of its own. In the days of Henry VIII. and of Elizabeth, of the Duke of York and his faithful secretary, Samuel Pepys, Woolwich was famous for the production both of ships and of guns; but the small-arms factory on the borders of Essex dates only from the early part of this century. Its site seems to have been chosen regardless of any peculiar advantages for manufacturing purposes. It is simply a collection of workshops built in the flat meadows through which run the various branches, natural and artificial, of the lazy Lea; and the nearest town, about a mile and a half distant, is quiet and remote little Waltham, chiefly known for its Abbey Church, the burial-place of Harold, which rises in its midst.

The situation of the Enfield Factory is, however, advantageous in this way: the canals form a safe means of water transit for the gunpowder which is manufactured in the adjacent mills at Waltham, and which is required at Enfield for use in the proving of the barrels of firearms;

while the far-stretching marshes provide an apparently interminable range for carrying out the necessary experiments and trials with regard to the accuracy of the weapons manufactured.

Where one of the canals has been conducted into a square-shaped basin, the older and principal buildings of the manufactory have been located. They form a quadrangle of some extent; and here, too, are situated the offices and the quarters of the executive staff, which is composed partly of civilians and partly of military officers. Behind these, on the east side of the enclosure, and on the banks of one of the canals, are rows of workmen's cottages. Near the entrance gates are situated schools for the workmen's children; and at the other end of this street, as we may call it, is a church, which is served by the clergy of the parish of Enfield. On the west side extend north and south the flat meadows or marshes which form so convenient a spot for the testing and proving of the rifles.

As we have said, all sorts of personal weapons required for the arming of a soldier in the English army are made here, not only firearms, such as rifles and revolvers, but lances, swords, and bayonets, the last having now become a sort of short sword. There is also one class of weapons which occupies a sort of intermediate position between those carried by the soldier himself and those drawn by horses—that of machine guns, as they are called, which, though not carried by men on their shoulders or in their hands, are drawn about by them on small carriages. These machine guns are classed with personal arms, because they are usually employed in connection with infantry; and also because—which is a far more important reason—the ammunition required for them is similar to that used in rifles. In fact, they are in principle only a collection of rifles as used by the infantry, fastened together, or, as we shall see, a single rifle barrel with machinery attached which enables it to discharge with great rapidity.

There is one more general principle which we shall do well to bear in mind before we enter the factory. It is this, that of course the manufacture of small-arms is in as much a condition of uncertainty as that of larger warlike weapons in these days. What we see now may become obsolete in a very short time, and we shall be shown specimens of firearms which formed the universal weapons of the British army only a very few years ago, but are now as much out of date for practical purposes as cross-bows. Remembering this, let us go first when we enter to one of the offices, where we shall see arranged in a rack against the wall, amongst others, specimens of the old Enfield muzzle-loader, of the same weapon converted into a breech-loader, of the Martini-Henry rifle, and of the latest pattern of all, the magazine rifle. While, stored away in some out-of-the-way corner, it is just possible we might come across a specimen of the old smooth-bore or 'Brown Bess,' which formed the weapon of certain English linesmen so late as the beginning of the Crimean War.

The Enfield workshops are of course in appearance much like other workshops. There are the same processes of forging and casting, and the same machinery for hammering and turning and boring and drilling which we see elsewhere. Let

us rather confine our attention to those things which we shall not find in other places. We have come to see the articles which are turned out from here, in the process of their manufacture, rather than the machinery by which they are made.

A rifle, as every one knows, consists of three portions—the wooden stock, the barrel, and the lock. The stock is usually made of walnut wood, and is manufactured in what we should perhaps describe as a carpenter's shop. Formerly, the stock of a rifle was formed out of one long piece of timber; but now the complicated machinery of the breech and lock cannot be contained in a hollow in the wood, as was formerly the case, but has to be enclosed in a steel case, to which the wooden butt and barrel support are screwed. To the rifles of the newest pattern there hangs, just below the lock, the magazine, in which are carried five or, in some cases, ten cartridges, which spring up into place in turn, ready to be discharged. In short, the rifle has become, as regards its rapidity of action, something similar to a revolver pistol. We shall find that a lock has in its manufacture to pass through an almost infinite number of processes, each part having to be forged or beaten out till the whole can be fitted together.

Let us pass on to the barrel-making shop. Rifle barrels are made from a solid round bar of steel, which is at first considerably shorter and stouter than the finished barrel will be. This steel bar is heated red-hot, and is passed between several pairs of rollers, which convert it outwardly into the required form. It has, however, afterwards to be bored and then rifled—that is, furnished with the spiral grooves within, which give the bullet the necessary spin. Of course the barrel is by far the most important portion of a firearm, and the barrels of rifles are, at Enfield, tested and proved in the most ingenious and searching manner. The first proof takes place after the barrel has been bored, but before it is rifled. The barrels are loaded with cartridges of considerably greater weight both in powder and bullet than those which will be used in them when they are ready for service, and are enclosed in a sort of strong box which has one side open. They are then discharged through the open side into a heap of sand, and examined; but it is a rare event to find a barrel that has not been able to bear this test. The second proof, which takes place after the rifling, is of a similar character.

But these proofs are only to test the strength of a barrel; the test of its accuracy is a much more delicate operation. Of course the machinery by which it is bored and rifled works with the most admirable precision; but yet it is necessary to put this machine-work to trial. There are, amongst others, two highly ingenious methods for doing this. In the one case it is placed on a stand which is so constructed that on it the barrel can be made to revolve rapidly. The barrel is pointed towards a window, and in front of it is a fixed sight. The workman looks through it while it is revolving; and if the sight remains steady to his eye, that is a proof that the barrel may be said to be straight. But there is yet another method. The mechanism of this testing apparatus is rather difficult to describe, but is

something of this fashion. The barrel is made to revolve as before; but this time there is inserted in it a spindle, on which is fixed a short arm with a point which touches very lightly the interior of the barrel. If there is any inequality, or if the barrel is not perfectly straight, this short arm is of course shaken, and when this is the case, the motion is further communicated to a long arm at the end of which is an indicator, which is looked at by the workman through a magnifying glass.

Barrel, stock, and lock being at last completed and tested, the rifle is put together; but even then it is subjected to one more trial. This is carried out on the proof-ground in the marshes, and takes the form of an actual discharge of the weapon at a target. The rifle is screwed to a fixed and firm support, and then a certain number of rounds are fired at ranges of five hundred and one thousand yards respectively. In this test the hitting of the centre of the target, or 'bull's-eye,' is not the end in view, as it is in ordinary target practice. That sort of shooting depends of course on the steadiness with which the marksman holds the rifle. In this case, however, the fixed rest may be directed on any portion of the target, and the grip will always be the same. The only object of the test is to see whether the rifle throws the bullet at each round on or near the same spot. A marker at the butt examines the position of each shot, and the smaller the space on which they strike, the better the weapon.

We have not yet spoken of the machine guns. These weapons are, as part of the regular equipment of armies, quite modern, though the idea of binding together a quantity of barrels and then discharging them at once, or with great rapidity one after another, is not altogether novel. Sometimes, instead of a number of barrels, one only is required, and the cartridges are discharged from short barrels or chambers which are brought in turn into position with the longer one. This is the ordinary revolver system; but modern machine guns are a great improvement on this method, and entirely dispense with the necessity of loading separate chambers. Machine guns have succeeded one another with extraordinary rapidity, and a gun seems only to be adopted in order to be superseded. Thus, we have had during the last few years a series of these weapons bearing the names of Gatling, Gardiner, Nordenfelt, and Maxim. We will not stop to examine all these specimens—most of which, as we have already said, may be considered in a way obsolete—but will only remark on the newest and latest. When the revolver system was given up, the idea was how to work with a single barrel and drop in cartridges as required. At first they were dropped in from a hopper or 'feeder,' which was fixed on the top; but by the latest invention the cartridges are supplied from a long belt with pockets, which passes through the breech portion of the gun. Belt after belt can be inserted, as it is a very easy matter to slip the cartridges into the pockets, so that the discharge is continuous as long as there is ammunition. The machinery for picking the cartridges out of the belt, for inserting them in the breech, and for extracting the empty cases, is rather complicated, but almost self-working, the power employed being that of the recoil of the gun. Another highly important invention is that the barrel, to guard against overheating from

the continuous discharge, is enclosed in a cylinder which is filled with water.

As we walk about the factory we see, besides the workmen, here and there groups of men in military uniform. These are armourer sergeants, who attend classes at which they are taught the mysterious mechanism of the breech-loaders and machine guns. In former days, Tommy Atkins could be instructed how to keep his weapon in order, lock and all; but now its complications are beyond the power of his understanding or of his fingers, perhaps of both, and he has to hand over his rifle to a more skilled superior when it is out of order. Truly, military matters, from the movement of the vast army corps of the present day down to the mechanism of the soldiers' weapons, have become a highly technical matter. Dugald Dalgetty, notwithstanding his lengthy practical training, would not have been in it now.

War has indeed become a science in this latter part of the nineteenth century such as it never was before; not, of course, that men can be made to march faster nor horses to gallop more rapidly than they did in former days, but because the weapons which are used are such marvels of mechanical skill. And yet in how few years has this transformation been accomplished. What a short space separates us from the days of smooth bores and 'Brown Bess,' and what a step it is, all at once, as it were, from firearms which were hardly an improvement on those of mediæval days, to the breech-loaders and magazine rifles and machine guns which are turned out in such vast numbers from these Enfield workshops.

And so we leave the said workshops with their clang and their bang, and the throb of great machines, and the whirl of wheels, and the heat and the apparent drive and hurry, though of course there is really order in what seems to us to be confusion; and we pass out across the flat low meadows, and along the banks of the scarcely moving stream. But as we make, it may be, for the old Abbey Church of Waltham, which rises before us, we feel there is one consolation which the sight of these wonderful weapons of war brings to us, and it is this: that modern science has made wars less lasting than they used to be; that as soon as a declaration of war has once been made, or an expedition decided on, the contest will be, though no doubt severe and terrible, yet short and decisive, and must perforce be followed by an interval of peace far longer than the period of fighting.

AN OLD MAID'S MARRIAGE.

By GEORGE B. BURGIN.

MISS MATTIE was in a dilemma. A chill gleam of April sunshine shot across the table and lit dancingly on Miss Mattie's face. Miss Mattie was not averse to sunshine ordinarily, but this intrusive and irresponsible beam annoyed her; besides, it made the flame of the fire look sickly, and disturbed maiden meditations. She put on her spectacles, carefully adjusted her cap, and prepared for the worst. Then she rang the bell for Prudence, her handmaiden, who appeared in Quaker gray and a snowy cap. Little rebellious curls danced out from beneath the cap in a frivol-

ous fashion which nothing could restrain. Even now as she came in she made an attempt to reduce them to order, but in vain.

'Prudence,' said Miss Mattie, 'what did the Doctor's boy say?'

'That worldly youth, Mistress, attempted to pass the time in vain discourse concerning certain maidens who attire themselves in blue raiment and smite a heathen instrument called the tambourine'—

'Yes, yes, Prudence,' interrupted Miss Mattie, 'I daresay. But what did he say about the letter?'

'He said, Mistress, that he was to take back an answer; and I have entreated him to much profitable conversation until the answer be written.'

Miss Mattie looked perplexedly at the grave, serene-eyed, little Quaker maid. 'How old are you, child?' she asked.

'Twenty, Mistress,' said Prudence.

Miss Mattie gazed at the unopened letter on the table, and then at Prudence. 'Prudence, you are young,' she said, 'but wiser than your years. Have you—have you ever had a sweetheart?'

Prudence looked a little unprepared for this remark. But she was conscientious. 'Truly,' she said, 'there is one stalwart youth, a carpenter, who has flattered me many times when going to Meeting, but to whom I have not been drawn.'

'Oh, you—you weren't drawn to him?' asked Miss Mattie.

'Nay, Mistress; whereat he is much provoked, and threateneth to'—

'To what?' asked Miss Mattie.

'To fare forth to foreign lands and forget me,' placidly answered the little maid.

Miss Mattie still struggled with a certain shameful consciousness that she had wavered. What a tower of strength Prudence was! 'Did you—did you—did he ever kiss you?' she asked in a whisper.

Prudence opened her blue eyes widely. 'Surely, Mistress, it is the manner of young men to indulge in such unseemliness unless discouraged.'

'And—and did—you—did you discourage him?' asked Miss Mattie.

A faint colour stole over the pretty little maid's face. She looked distressfully at the carpet. 'The youth was strong, and I but slight,' she answered in confusion; 'and he was about to depart and—and'—

'W-what did he do?' asked Miss Mattie eagerly, still holding the letter in her hand.

'He saluted me, Mistress,' answered Prudence. A faint smile played over her lips at the recollection.

'Sit down, Prudence,' said Miss Mattie. 'I want to ask your advice, child. You know more about men than I do.'

Prudence sat down. Miss Mattie regarded her as a daughter, although Miss Mattie herself was only forty-five. But people in Little Bingleton rather prided themselves on looking old. It was thought to savour of flightiness if folks adopted modern fashions or travelled often to town. Miss Mattie was the only daughter of the late Dr Sewell. Ever since her father's death, which had happened about ten years ago, she had lived in

her own pretty little cottage on the outskirts of the town. People who remembered her fifteen years back said that Miss Mattie was then very handsome. She was still a sweet-faced woman, with rich auburn hair, and placid blue eyes. There had been whispers of a girlish romance a long time ago; but by-and-by people looked upon her as a confirmed old maid. The years passed, and still Miss Mattie lived her quiet uneventful days, until Dr Slurke, the one practitioner in the place, suddenly discovered that Miss Mattie was wasting her life. 'You've a mission to fulfil,' he had said. 'What is it?' placidly demanded Miss Mattie. 'I will go home and write it to you,' retorted the Doctor, attacked by a sudden fit of shyness. His manner had occasioned Miss Mattie some misgivings, but she had concealed them under her usual placid exterior until the arrival of the fatal letter.

The latter lay upon the table. Miss Mattie dared not open it. It seemed as if the occasion demanded a solemn and formal ceremony of some sort—a ceremony with witnesses. 'Open it, Prudence,' she said suddenly, turning to the little maid.

Even Prudence could not conceal something which approached to worldly curiosity. She took the letter in her hand and opened it with her usual deliberation. 'The man has a concern to marry thee, Mistress,' she said, after a steady perusal of the letter.

No woman likes to have a proposal of marriage put before her in so baldly prosaic a manner as in this instance. Miss Mattie felt that the occasion was not being treated with sufficient solemnity. 'Read it aloud please, Prudence,' she said; and Prudence read it:

DEAR MADAM—I never proposed to any one before—haven't had either the time or the inclination—and I have vainly consulted all the literature on the subject. Most of it seems to me to be rubbish. You are a sweet, amiable woman, of rather a melancholy disposition; I am bustling, savage, irritable, loud, and overbearing. Don't you think that we each have what the other lacks? I'm tired of living alone, so must you be also. Couldn't we join forces and travel together? You must be very solitary, and it is always so comforting to have a man in the house in case of burglars or fire or anything of that sort. Will you marry me? If so, kindly return a note in the affirmative by bearer, and I'll come up this evening to talk it over. If my letter is lacking in delicacy, remember that doctors are accustomed to come straight to the point. You want rousing; so do I. Which shall it be? Yes or no? I shall be walking impatiently up and down my garden—an exceedingly rash thing to do in this east wind—until I receive your reply.—Yours very faithfully,
SILAS SLURKE.

'Is that all?' demanded Miss Mattie, who had faint hopes that the missive would be couched in all the long-winded eloquence of Miss Austin's heroines.

Even Prudence seemed to have found it disappointing. She inwardly contrasted it with certain vain but impassioned utterances of the young carpenter, and then rebuked herself for instituting worldly comparisons.

'Is there nothing more in the letter, Prudence? Nothing about love?'

'The letter lacketh worldliness of that kind,' answered Prudence, seriously scanning the page.

Miss Mattie had not lost all sentiment. She recalled that episode of her vanished youth when Reuben Rountree had declared that he worshipped her. Reuben was only a farmer's son—a struggling farmer—and Miss Mattie's exalted position had been declared a fatal obstacle to Reuben's pretensions. Whereupon, Reuben had uttered wicked words, shaken his fist at Mattie's white-haired old father, and departed to lands unknown in search of fortune. He had taken a lock of Miss Mattie's fair hair with him, and she still cherished in secret a little black daguerreotype of the departed swain. All this had happened a quarter of a century ago. At first, the faith of love had kept Miss Mattie's heart warm. But hearts grow cold and faith wavers and dies away when the years pass and absent lovers make no sign.

Miss Mattie drifted placidly adown the stream of Time, distributing little gifts to her neighbours on the banks, and winning the love of all. But she found life rather dull. Her old school-fellows had large families, who called Miss Matilda 'Aunt Mattie,' and confided all their troubles to her sympathetic ears. Miss Mattie also found, to her very great surprise, that men rather disturbed her. She liked her little nap after dinner, her game of backgammon with Prudence in the evening, her regular quiet life. If she had married Reuben, all these things would have become impossible.

Miss Mattie did not like to be hurried. And yet—and yet. As she sat there holding Dr Slurke's letter in her hand, her youth came back. How the poor boy had loved her! She recalled his foolish speeches, his fondness for her yellow locks and blue eyes, and all the thousand-and-one little tricks and jests with which he had beguiled her into loving him. Dr Slurke's letter had unsettled her. Though she felt she could not marry a man who never wiped his boots on the mat, and believed that a congested liver was answerable for all the sorrow in the world—yet there might be hidden depths of love within him. He was a doctor, too. That was another recommendation.

Prudence still waited, the letter in her hand.

Miss Mattie temporised. 'I—I will ask him to tea, Prudence,' she said, as she sat down to her desk and wrote in an elegant Italian hand that she must have further time in which to consider Dr Slurke's flattering proposal. 'And Prudence,' she said, as she sealed the letter—Miss Mattie always used a seal—'see that your pikelets are plentiful and of the best. Nothing comforts a man so much as a good tea.'

Miss Mattie was a little bit ruffled by the events of the day. She went up-stairs and looked long and lovingly at a certain little tin portrait. Then she put on her best lavender silk dress, removed her cap, and went down-stairs to her cosy sitting-room.

A man's step scrunched the gravel outside, and the next moment an unknown voice demanded if Miss Matilda Sewell lived there.

Miss Mattie thrust the daguerreotype into her bosom and went out. 'What is it, Prudence?' she asked.

'A wayfarer from over the seas who would have speech with thee, Mistress,' said Prudence quietly, as she went back to her pikelets.

Miss Mattie felt an odd sensation at her heart. It fluttered and leapt. What if this burly stranger brought her news from the forgotten Reuben!

The stranger held a letter in his hand. 'I've just come down on the cars with a letter from an old friend,' he said.

'On the what?' asked Miss Mattie, in bewilderment.

'On the cars. Oh, I forgot. You call them trains. Can I come in?'

'With pleasure,' said Miss Mattie, in a fluttered, odd little tone. 'May I offer you a dish of tea?'

The stranger seem puzzled. 'We generally drink it in mugs,' he said.

He took off his hat and coat and carefully hung them on a peg in the hall. The passage seemed to shrink when he walked along it, and his head hit against the low little portal as he followed Miss Mattie into her small sitting-room, full of delicate china, and gay with samplers and quaint old mirrors on the walls.

The stranger sat down in an armchair by the fire. He seemed to swell over the sides of it. The cat jumped on to his colossal knee and went to sleep there.

Miss Mattie sat facing the window, and feeling reassured. She trusted that cat's instinct almost as much as she did the wisdom of Prudence. And the cat did not know young carpenters.

As the stranger glanced round the room, the ancient figures on the samplers caught his eye. He studied the impossible peacocks spreading their tails under equally impossible trees, and his eyes twinkled. 'My! Ain't they real pretty!' he said. Then he looked at another sampler. 'I like that picture of Noah and his sons sitting on top of the Ark,' he observed genially.

Miss Mattie felt distressed. She did not like to interrupt his flow of art criticism by admitting that the Ark was meant for the roof of a house, and Noah and his sons were only four ravens perched on the ridge.

'Excuse me,' said the stranger, handing her a letter. 'Won't you read this first, and then we'll talk.'

Hospitality was a sacred rite with Miss Mattie. 'I trust that you will partake of my poor hospitality first, M-Mr—?' she said, with a stately bend of her head.

'Alphaeus P. Winterbottom. I'd be sorry to go away without doing so,' answered the stranger heartily, as Prudence appeared with the pikelets.

'Prudence,' said Miss Mattie solemnly, 'make some more.'

'You're right, Ma'am,' said the stranger, surveying the little dish. 'I was just thinking I could eat the whole lot of those cunning little cakes.'

And Miss Mattie actually laughed. Her tea-parties were usually very solemn and stately affairs. Mrs Pennifather, the Rector's wife, always came in a copper-coloured silk. Miss Twinkleton, too, invariably donned her best old yellow lace ruffles for the occasion. The stranger, however, wore garments of a transatlantic cut, and had a pointed beard. He was

a fine handsome man of about forty-five. As Miss Mattie handed him a fragile cup, the last of the pikelets had disappeared.

'My! Miss Sewell,' he said, 'I'm quite forgetting the little men up there on the walls. There won't be a crumb left for 'em at this rate.'

Miss Mattie laughed again. Another step sounded on the gravel path outside.

'It's Dr Slurke,' she said, uncomfortably. 'I—I had quite forgotten him.'

Dr Slurke opened the door, and recoiled in angry amazement. There was Miss Mattie—*his* Matilda, as he was wont to call her in dreams—when he did dream, which was but seldom—chatting genially away with some foreign ruffian whom he had never before heard of or known to exist. It was indecorous; it was vulgar; it was unfeeling; it was aggravating; it was unprofessional; and the kind of thing which he (Dr Slurke) was not going to put up with from any lady however nice she might be under ordinary circumstances. So he pulled his stubbly beard and glared at the stranger. But, unfortunately for the Doctor, Mr Alphaeus P. Winterbottom was not overwhelmed.

Miss Mattie half rose from her chair. 'Good-evening, Dr Slurke. Won't you come in?' she inquired, with the sugar tongs poised in her white hand.

This was another insult. She was pouring out her best tea and giving it to the man in the chair. Dr Slurke did a very foolish thing—a thing he had often done before, but never without experiencing disastrous results. He lost his temper. He drew himself up to his full height—five feet three—and scowled on the Pirate King in the armchair—this ruffian who stole people's hearts by nursing their objectionable old Persian cats.

'Won't you come in?' tremulously repeated Miss Mattie.

Dr Slurke bowed sarcastically. 'I thank you, no, Madam,' he said. 'I only came in to inform you that I had caught a cold in my garden whilst awaiting your pleasure.'

The other man looked quietly up. 'I guess, you ought to be proud of it,' he said, in his objectionable American way.

Dr Slurke bowed to him with withering irony. 'I—eh—was not aware that I was asking a conundrum,' he said. 'May I inquire who I have the pleasure of addressing?'

The stranger smiled. 'My name's Winterbottom—Alphaeus P. Winterbottom.'

Miss Mattie let fall the sugar from the tongs. 'Oh, Dr Slurke,' she said, with tears in her voice, 'I am so sorry. You see it was rather a difficult question to answer, and'—

'I will thank you to be good enough not to discuss it before this gentleman,' the Doctor ejaculated at a white-heat.

'But I—I really'— And poor Miss Mattie felt inclined to cry.

Mr Winterbottom was moved by Miss Mattie's distress. 'Shall I make him shut the door from the outside?' he asked, quietly caressing the cat. 'I think, Madam, you'd feel more comfortable if this turkey-cock sort of person had gone home to roost.'

'I was not speaking to you, sir,' said the

Doctor. 'My remarks were meant for this lady.'

'I could just drop him into a nice soft flower-bed, if you'd only say the word, Madam,' quietly continued Mr Winterbottom.

'Madam, I take my leave,' said the angry Doctor.—'As for you, Mr Winterbeans, you shall hear from me.'

'Not professionally, I hope,' said the imperturbable stranger. 'Don't distress this lady any more, or I'll really have to come and reason with you.'

The Doctor withdrew, speechless with rage. Poor Miss Mattie began to cry softly into the teapot.

The stranger put the cat down, gently approached the table. 'Madam,' he said, 'that extremely ill-tempered person will be better to-morrow. If he ain't, I guess I'll have to reason with him—near a pond.'

'Oh, please don't,' said Miss Mattie, feeling comforted by the stranger's vast bulk. 'I—I kept him waiting for an answer to—to an extremely delicate matter this evening, and—and he's cross with me.'

The stranger led Miss Mattie to the armchair. 'Now, you sit there, Madam,' he said in his gentle, kindly way. 'I'll brew this tea for you. You just assimilate those cunning little cakes of yours, and you'll feel better. One lump of sugar? Isn't it?'

'Yes,' said Miss Mattie, feeling that support from conscious strength which delights most women.

'And the cream?' said the stranger, holding up the dainty little cream ewer admiringly. 'My! Ain't that little pitcher pretty! And the fire! Beats our stoves hollow.' He handled the dainty tea equipage with jealous care, and waited on Miss Mattie so nicely that all her fears vanished.

'A gentle lady like you didn't ought to be bothered,' the stranger said reflectively, when Prudence had cleared away the things—'didn't ought to be bothered by a grasshopper like that. I daresay he means well, but he don't colluscitate worth a cent. That's what's the matter with him. Now just tell me if you feel downright chipper again, and if so, we'll go into this business, or, if you prefer it, I'll come again to-morrow.'

'I thank you, Mr Winterbottom,' said Miss Mattie, in her simple friendly way. 'It—it was foolish of me to—to be so frightened. The Doctor has been very kind to me.'

'Then I'll let him off the pond,' said Mr Winterbottom, as if making a concession to sentiment. 'You're like one of those pretty wind-flowers we have in our country—you want sheltering from all the storms that blow.'

Miss Mattie smiled a pleased little smile. She had never been compared to a wind-flower before.

Mr Winterbottom took up the letter with his customary deliberation. 'Now, Madam,' he said, 'I'll read it to you, and when I'm bumping over a *cahot*, you tell me to pull up, and I'll drive quietly!'

Miss Mattie did not understand what a *cahot* was. The stranger explained that it was a hole in the road in winter, and that a sleigh had to

glide gently over and not take it flying, for fear of bumping the bottom out.

'Is—is the letter from Mr Rountree?' asked Miss Mattie, with quivering lips.

The stranger looked at her admiringly. 'Now, Madam,' he said, 'I never did see your like for coming straight to the point. You've fine instincts. That's what the widower said when he was telling me about it.'

'The—the—— Did I understand you to say widower? To—to allude to Mr Rountree?' inquired Miss Mattie. She felt crushed. Reuben had not been true to her; he had forgotten his youthful love; all these years she had allowed her heart to remain in the keeping of a man who did not want it.

'I'd better read his letter,' said Mr Winterbottom. 'His wife wished it, you know.'

'I—I don't know,' said Miss Mattie, trembling. 'I don't know. But, oh, Mr Winterbottom, you have been so kind to me, that I would rather hear it in your own words, please.'

Mr Winterbottom looked gratified. 'So you shall, Madam,' he said—'so you shall. You see, Reuben settled down in Ontario five-and-twenty years ago.'

'Yes,' said Miss Mattie.

'And then, when he was doing pretty well, he married old Deacon Tucker's oldest.'

Miss Mattie was but human. 'Was—was Miss Tucker comely?' she asked.

'Sort of apple-cheeked,' said Mr Winterbottom. 'The girls are more like Reube.'

'The—the what?' gasped Miss Mattie.

'The girls.'

'Are—are there many?'

Mr Winterbottom reflected. 'Well, there's Samantha, and Delia, and Lelota, and Theresa, and the Twins.'

Every fresh name made the matter worse. The stranger saw it. 'I can't remember the names of the others,' he said comfortingly; 'but there aren't many—seven or eight, maybe.'

'Is he happy?' inquired Miss Mattie, still clinging to her romance, as only a woman can. She would not be harsh or unjust to Reuben. Whilst she stayed at home and dreamed her life away, he had gone into that vast new country and won a living from the soil. He had worked out the grief from his heart, and—and forgotten her. She might have known that his strong loyal nature could not fail to find an appreciative helpmate. This Canadian girl who had loved him had not stayed to think of social position; she had grasped the substance instead of the shadow. Poor Miss Mattie's tears flowed freely. Perhaps Reuben's grief when his wife had been called away had prompted him to think of her, Miss Mattie.

'Wh—what is his message to me?' she inquired.

Mr Winterbottom came a little nearer to Miss Mattie. 'Well, you see,' he said gently, 'she was kind of jealous of you, Madam. Reube told her you'd always be first in his heart, and so, when she was called away, she asked him to send for you to—to look after him.'

'And—and what did he say?' asked Miss Mattie.

'Well, you see, Reube hadn't the heart to tear you from your old surroundings, even if you'd been willing to come. So he sent me. "Tell

her," he said—"tell her all my life I've turned to her in sorrow and joy alike; all my life she's been my guiding star. In the woods I've seen her walking before me, clearing the way, and everywhere she stepped the corn grew greenly. Tell her," he said, "in all that coarse, rude, rough life, with its struggles and trials and pains and successes, she's never left my side for one moment. She's been the angel of my life, the pure sweet English girl, who I know has been true to me all these years. The"—'

'Stop!' said Miss Mattie, quivering with excitement, as the tears streamed down her cheeks. 'Please stop, Mr Winterbottom—stop. To say this to me means that he was disloyal to her. Don't let me think the man I loved all my life could have been false to us both. Please leave me that. Don't take that away from me. It—it has been the only thing which has sustained me in my loneliness. I have lived a quiet, faithful, uneventful life, keeping and guarding the love which God put into our hearts. Don't tell me that now, after all these years, he could send me such a message as that. It must be some dreadful mistake'—in her excitement she laid her hand upon Mr Winterbottom's arm—'some dreadful mistake. It is natural that he should turn to me now; but he must have loved her while she lived. It is only his sorrow which makes him seem to forget. Tell him I will be a mother to his children—go to them—cherish them; but unsay those words which have destroyed my ideal, the ideal which I have taken to my heart all these years. The sacredness of love must not be broken like this. Tell me!—tell me! Oh, I would rather be the humblest beggar that ever craved charity, than believe the man I loved could win some other woman's heart and profess to have loved me too.'

Mr Winterbottom gently took her hand. 'My dear Madam,' he said—'my dear Madam, I *know* he never loved any woman but you.'

Miss Mattie buried her face in her hands. Disillusioned by both the men who had loved her—disillusioned in one evening! Well, she had had five-and-twenty years of trustful, loving faith and hope, and now she must hide her grief and try to live it down. She wanted to get away to her own room—to be alone—to think over this shock. And all the time she grieved, the stranger's gentle pressure grew firmer still. It comforted her. She experienced a strange thrill—a thrill which she had never expected to feel again. And then she strove to withdraw her hand, and accused herself of immodesty.

'Mattie!' the stranger's voice sounded in her ears—'Mattie, don't you know me? I am Reuben! I have never married—never loved any one but you; and I have come home to stay, to comfort your life, to give you back the years you have spent without me, to guard and love you with the firm strong love of manhood, and to atone to you for all the sorrow of the past. Look up, dear, look up. Say to me'—

She looked up through a mist of happy tears as he caught her to his heart. 'What can I say to you?' she whispered. 'Oh, Reuben, Reuben, I have waited so long! I have doubted the goodness of God. And now He brings you back to me—He brings you back.'

Reuben put his strong arm round her. 'Dear,

forgive me. I wanted to know if you still cared for me. I could not come until I had made money enough to give you a higher position than that of a farmer's wife. And now let us be happy.'

She put her hand in his. 'Ah, Reuben,' she said, 'how often our pride places before it everything else and robs us of the years. I am not the girl you knew and loved—I'm only an old maid.'

But he gazed into her truthful, loving eyes, blue with the blue of heaven, and then he kissed her.

'They will call it an old maid's marriage,' she whispered with a smile upon her lips.

THE MONTH: SCIENCE AND ARTS.

A VERY wonderful engineering work, which has occupied eleven years in its execution, has just been brought to a successful issue in the establishment of a new water-supply for the city of Liverpool. That this is a very wonderful work must be conceded when it is remembered that the water is drawn from a source more than seventy miles away from the city, and that the enterprise has involved the creation of a lake nearly five miles long which drains twenty-three thousand acres of ground. The new lake is situated in the Vyrnwy Valley, which, ten years ago, was a bare region without any particular interest attached to it. No doubt, a lake existed here long ago in the Glacial period, but this fact has been forgotten, except by geologists; and the engineers have now reinstated the Vyrnwy Lake by means of an immense dam of solid masonry. Manchester has for a long time drawn her water-supply from a distant lake, and Birmingham is taking similar steps to supply her need of the first necessary of life. Presently it will be the turn of London itself to provide for its rapidly increasing multitudes by a similar scheme.

The Photographic Convention of the United Kingdom is a useful society, which, like its elder brother, the British Association, meets annually at some large centre for the purpose of reading and listening to papers on different subjects, and refreshing its members by excursions into the surrounding country. This year they met at Edinburgh. Next year, Plymouth is chosen as the scene of their operations; and the following year they will probably meet at Dublin. The Photographic Convention is now in its seventh year of existence, and the rapid increase in its membership proves that its labours and cause are appreciated.

At Barwick, near Ware, stand the premises of the Smokeless Powder Company, the only works of the kind in the kingdom. These works cover no fewer than one hundred and twenty-six acres of ground; and a large company assembled there recently to watch the entire process of manufacture from the raw material to the finished explosive. This new compound differs from the

old black gunpowder not only in its freedom from smoke when ignited, but also in the circumstance that it is unaffected by damp or extremes of temperature. After the works had been inspected, the quality of the new powder was tried with various weapons by expert marksmen, and excellent practice was made. The exhibition concluded with the firing of five hundred rounds from a Maxim gun, when it was shown that far less smoke was produced than with ten shots fired with the old-fashioned gunpowder.

A curious relic of the early days of telegraphy will be shown at the Chicago Exposition by one of the American railway companies—namely, the original apparatus which was employed for laying the first underground telegraph wire, that of Morse. This wire was originally laid from Washington to Baltimore, and the apparatus for laying it in the ground consists of a heavy plough with a reel behind carrying the wire; thus the furrow was made by the plough, the wire laid therein, and covered up again as the plough proceeded on its way. It was soon found that the leakage to earth was so great that some other system must be adopted, and so overhead wires on the familiar telegraph posts became general. This relic of bygone times is to be exhibited in very complete form with wax figures representing Professor Morse and his workmen, while sixteen stuffed oxen will represent the original team which drew the machine over the ground.

Could the pioneers of telegraphy have had a vision of the network of wires both above and below ground which are now so common in our large commercial centres, they would have been incredulous; nor would they have ever guessed that a nefarious industry would arise in the tapping of telegraph wires in order that knaves might listen to messages not intended for them from which they might derive profit. This is now the case in New York, where a gang of wire-tappers, consisting of about twenty-five dishonest telegraph operators, and as many more inferior workmen, make a regular business of tapping the wires over which the returns of horse-races are sent, so that by the news thus obtained they may be able to defraud the book-makers. They carry on their operations in the most impudent manner, often meddling with the wires under the pretext of being workmen who have been commissioned to make repairs, and it is said it is very difficult to stop their depredations.

Of late years we have heard a good deal of drugs, leaves of plants, &c., which have the property of conferring upon mankind power to withstand fatigue. The latest introduction of this kind is described by a correspondent of the *Globe* newspaper as a pastile which is said to take the place of both food and drink. It was lately tested on a company of Roumanian soldiers who completed a march of seventy-five miles in twenty-seven hours, and whose sole food during that time was in the form of these pastiles. First, each man had a pastile every half-hour, and later on, three every hour; at the same time the pastiles dissolved in a small quantity of

water were supplied to the horses which accompanied the troop. At the conclusion of the march, both men and officers declared that they felt no fatigue whatever, and spoke highly of the sustaining powers of the new preparation. The pastiles are said to contain a large quantity of caffeine.

A device for preventing caterpillars from climbing trees has lately been described. It consists of alternate wires of copper, which are wound round the tree trunk at a distance of about half an inch from one another. These wires are in connection with a source of electricity, and when the circuit is completed by the caterpillar bridging the metals with its body, it receives a shock which either destroys it or at anyrate makes it let go its hold. It may be mentioned that a plan has for a long time been common of protecting shrubs and flowers from the incursion of slugs by placing rings of zinc and copper round the root. The two metals when touched by the moist body of the slug develop sufficient electricity to cause the creature to turn back.

The Society for the Protection of Ancient Buildings has for many years been carrying on a very good work. At their last meeting, it was stated that more than one old building in London had recently, by the intervention of the Society, been saved from destruction or restoration, terms which are too often synonymous. At the same meeting there were expressions of regret that the Society had failed to prevent the restoration of St Helen's Church, Bishopsgate, one of the few old buildings in London which escaped the Great Fire of 1666. It may be mentioned here that one building in that neighbourhood—the house of Sir Paul Pindar—the demolition of which was necessary in consequence of street improvement, has been re-erected, so far as its handsome carved front is concerned, in the Architectural Court of the South Kensington Museum.

During a recent tour in Algeria the French Minister of Public Instruction and Fine Arts visited the Arab city of Timgad, which is described as an Algerian Pompeii. Certainly this old Arab city, which is now but a heap of ruins, has seen almost as many vicissitudes as the Italian Pompeii. It was built in the first century of our era, and is situated in the province of Constantine. It was overrun by the Moors in the sixth century, and ultimately destroyed by successive earthquakes. Like Pompeii, it was a place of fashionable resort, and its ruins show remains of handsome pavements, beautiful statues, a theatre, fountains, and baths. One immense temple is dedicated to Jupiter, and this is now being excavated and thoroughly examined. The province of Constantine is very rich in Roman remains; and it is hoped that the visit of the Minister of Fine Arts will result in funds being found for the necessary excavations being carried out, so that we may learn more of this interesting buried city.

It has always been a common idea that cheese is a valuable aid to digestion, hence the invariable custom of concluding the principal meal of the day with a modicum of that toothsome compound. From the recent experiments of a German chemist, it would seem that cheese does not possess the virtues which have been attributed to it in this respect. This chemist placed

various kinds of cheese in an artificial digestive fluid, among the constituents of which was a large proportion of fresh gastric juice. The various kinds of cheese took from four to ten hours before they were dissolved, and as an ordinary meal is digested in from four to five hours, it would appear that cheese must hinder rather than aid the process.

The careless nursemaid who leaves a perambulator upon a sloping footpath unattended, perhaps on a windy day, is responsible for many a sad accident. An attempt to grapple with such disasters is seen in a Safety Perambulator which has just been introduced by a firm in London. In this little vehicle there is a brake which fixes the wheels, except when the handle of the perambulator is grasped by the person in charge, when they are at once released. Close to the handle is a lever bar which is grasped by the attendant with the handle, the lower end of the lever being connected with a strap which passes round a drum attached to the axle of the hind-wheels. By the coiling of this strap round the drum the wheels are effectually locked, and the vehicle cannot be moved.

One of the most beautiful improvements which the Metropolis has experienced of recent years is the creation of the handsome Victoria Embankment, which borders the north side of the Thames. Persons of middle age can remember how on this same site was presented at low tide a vast expanse of black mud. Never does this Embankment look so beautiful as at night, when its curved form between the bridges of Westminster and Blackfriars presents a semicircle of light. It has now been decided that this important thoroughfare shall be lighted by electricity, not for the first time, for about ten years ago experimental electric lights were erected here, and were used with beautiful effect for many months. The system then employed involved so much expense that it had to be abandoned; but now the science of electric lighting is so much better understood that the new installation is sure to be of a more permanent character.

In the last annual Report from the British Vice-consul at La Rochelle, a vivid description is given of the ravages caused by the white ants, which infest that town. It would seem that these destructive insects were introduced about the end of the last century; and the plague might have been stayed if the precaution had been taken of at once burning all timber which had become affected; but this was not done, and the pest is considered to be almost incurable. In many cases, the beams and other woodwork of the houses are so eaten away, leaving a mere shell outside, that they have to be removed and replaced by iron. By this means alone can the houses in many cases be ensured from utter collapse.

A method of preserving wood from the attacks of insect pests and other destructive influences was some years ago introduced by Colonel Haskin of the United States, where it is in extensive use with very satisfactory results. From time immemorial it has been the custom to preserve wooden posts which have to be fixed in the ground by charring them; and although this process is an effectual preservative, it has the drawback of

burning away a certain portion of the wood, and therefore robbing it of some of its strength. Colonel Haskin conceived the idea of doing the work more efficiently by submitting the entire body of the wood to the action of superheated air in closed retorts. Wood treated in this way is said to be 'vulcanised,' and the action of the heat not only preserves it against decay, but confers a strength and hardness upon it which it did not before possess. On the New York elevated railways, vulcanised yellow pine timbers which have been in use for the past six years do not show any sign of deterioration, while untreated wood exposed to the same conditions of weather is in a state of decay. A company is being formed to work this process, which is of an inexpensive character, in this country.

Although we hear so much of illumination by gas and its modern rival electricity, there is no doubt that the majority of householders throughout the world use mineral oil as their chief source of artificial light. In this country alone there are, it is said, more than ten million lamps burning mineral oil in nightly use, and though perhaps some of us hardly realised that the employment of these lamps was so general, we are constantly reminded by the newspaper reports of terrible accidents that the use of such lamps is not only common, but dangerous. At a recent inquest upon a victim of one of these accidents, it was stated that three hundred deaths every year are caused in this country alone by similar disasters; and in one year Captain Shaw, the former Superintendent of the London Fire Brigade, reported one hundred and fifty-six fires caused by the upsetting of lamps in the Metropolis. Many devices have been invented to render these lamps safe, so that should they be accidentally upset, the flame is automatically extinguished; and such devices have from time to time been noticed in these columns; but unfortunately they are not adopted, and probably will remain neglected until legislation is brought to bear upon the subject.

It is a matter of common knowledge that india-rubber goods even of the highest quality are perishable. Although not subject to any great wear and tear, the time comes when the rubber loses its elasticity and becomes soft and rotten. Hitherto, such perished rubber has represented a waste material for which no use could be found; but by a process recently invented, the perished rubber can be made, it is said, once more serviceable. By incorporating the waste rubber with certain hydro-carbons and with a proportion of Trinidad asphalt, by adding to the mixture certain vegetable oils, and submitting the product to heat, there is produced a substance to which the name 'Blandyte' has been given. It can be made hard and dense, or soft and pliable by modifying certain parts of the process; and it seems to be applicable to most of the various purposes for which pure rubber is used. Compared with rubber, vulcanite, or leather, blandyte is a wonderfully cheap material, due, of course, to the fact that its chief constituent has hitherto been of no value. The offices of the syndicate by which the manufacture is now being carried on are at 78 Gracechurch Street, London.

During the dark and foggy days which visit the Metropolis and other large towns in the

winter-time, thousands of extra hands are employed upon our railways, whose duty it is to place detonating signals upon the rails, which supply the place of the ordinary semaphores, which are invisible through the murky atmosphere. This means great expense to the railway companies both in men and material, for each of these fog-signals costs three-halfpence. An improved method of signalling to the drivers of locomotives in thick weather has recently been brought forward. On the locomotive itself is fixed an electric bell, to which is attached a contact device, which operates by means of a movable bar which is associated with each signal-box. When the engine passes such a signal-box, contact is made, and the bell rings; and by the number of beats upon the gong, the engine-driver knows whether to proceed or whether to stop. The apparatus does not interfere with any existing signalling arrangements, and would be quite automatic in action provided that the signalman attended to his levers just as if the weather were clear.

A Lucifer-match factory is about to be established in Calcutta. The promoters of the enterprise are natives who, as soon as they had conceived the idea, collected samples of wood from different parts of the country and submitted them to European experts. Some of these woods have been found very suitable for the purpose of match-making, and it is said that they can be purchased at a very cheap rate. The chemicals required can also, it is said, be made in India; and with the cheap labour there obtainable, the enterprise has every prospect of success.

A few years ago the Phonograph of Edison and the wonderful things that might be expected of it were common topics of conversation, and many have expressed surprise that after so much promise, the performance is so small. 'Why,' they ask, 'is not the phonograph to be obtained commercially?' It was long ago reported that its inventor had perfected it, and it has been exhibited all over the country, in order that the public might be made acquainted with the really marvellous results of which it is capable; but still it cannot be purchased, and no one seems to know the reason why. In France, if a patented article is not produced as a marketable thing within a period measured by so many months, the inventor cannot claim further protection for it; and this being the case, it is possible that some French speculator may flood the world with phonographs which do not bear the name of Edison.

Hitherto it has been thought most dangerous, if not impossible, to discharge shells containing high explosives from ordinary guns, the danger lying in the possible premature explosion of the shell, through the shock communicated to it by the gun. This difficulty seems to have been surmounted by Dr Justin, who has recently conducted a series of experiments with shells charged with explosive gelatine. Dr Justin states that the danger of igniting explosives contained in shells is caused more by the friction induced by the rotary motion of the projectile, than from the shock induced by starting it on its flight, and this friction he reduces by placing the explosive charge in an inner chamber of wood. By discharging heavy shells of this character

against a target of solid rock, the enormous destruction possible with them was made evident. The shells used were fitted with a delayed-action fuse, so that they did not explode until they were buried in the cliff against which they were aimed.

It is with a feeling akin to regret that we learn that the ancient city of Rome is to be modernised by being illuminated by electricity; but such is indeed the case, and the works to supply it with the necessary current were recently inaugurated. These works are at Tivoli, twenty-two miles away; and the motive-power for driving the necessary dynamo-machines is found in a volume of water having a fall of about one hundred and sixty-four feet. The electricity thus generated will be carried from Tivoli to Rome by four copper overhead conductors, and the loss of power in transmission is calculated to amount to twenty per cent.

G A M B I E R.

THERE are perhaps few substances more widely if indirectly used and at the same time less known to those outside the immediate industry concerned, than Gambier. The very name is unfamiliar to the general public; whilst any knowledge of the origin and mode of preparation of gambier is uncommon. Gambier is very extensively employed in the dyeing and tanning industries; and a large number of materials and articles of daily use have in the course of their manufacture been treated with the substance under consideration. Gambier is, moreover, a valuable medicine, and the more carefully prepared qualities are largely used in cases of diarrhoea, dysentery, relaxed throat, &c.

Similar in chemical composition to ordinary catechu, gambier is obtained by boiling the leaves and twigs of the *Uncaria Gambier* plant, a native of the East, and found either wild or cultivated in Malacca, Penang, and Singapore, as well as in Java and Sumatra. *Uncaria Gambier* belongs to the natural order *Rubiaceæ*, in which are also embraced the cinchonas or quinine-yielding plants, as well as coffee. The flowers are small and crowded together, and the plant itself is a strong shrubby climber.

Gambier appears to have been used in India for dyeing purposes from a very remote period; but its introduction into Europe only commenced with the present century.

The manufacture of gambier is still conducted on very primitive lines, and with the crudest appliances. A plantation is generally cropped some eighteen months after being planted; and cropping may be repeated as often as four times a year, the operation being oftentimes conducted with no sparing hand. The remaining process is exceedingly simple, the leaves, twigs, &c., being boiled in a rough caldron until the water in which they are steeped becomes syrupy. The extract is then drawn off, cooled, and stirred until crystallisation commences. The gambier is then cut by hand into cubes, dried either by simple exposure to the air or by smoke, and packed in mats for exportation.

The life of a gambier plantation averages only some ten years; and in fifteen years at latest it is abandoned. The capital required is very small,

and the returns are rapid, hence the favour with which the industry is regarded by the Chinese.

Gambier has a pale brown or yellow colour, with an even earthy fracture, the cubes of commerce being about an inch square. There is much variation in the quality of the gambier offered for sale, and the art of adulteration has penetrated this branch of industry. At one time there are stated to have been eight hundred gambier plantations in Singapore alone; and the amount of gambier imported into Great Britain from the Straits Settlements alone is no less than twenty thousand tons per annum.

Gambier is undoubtedly a valuable commercial product; and with improved appliances for its manufacture, and judicious management of the plantations, can hardly fail to develop largely at no distant period.

F O R E V E R.

Two little streamlets leapt and flowed,
And sang their songs together;
They felt alike the summer rays,
And bore the stormy weather;
The selfsame blossoms decked them both
In colours rich and rare;
And in each stream the song-birds wooed
Their bright reflections there.
And on, and on, and on they danced,
Each leaping toward the river,
And then they met to kiss and part
Forever and forever.

Two human lives, two kindred hearts,
By destiny's decree,
Met in the spring of life, to learn
Its deepest mystery.
They dreamed their morning dreams of hope,
Through fair unclouded weather;
They opened love's bewitching book,
And read it through together;
They saw in one another's eyes
A deep unspoken bliss;
And from each other's lips they took
Love's ever-ready kiss.

And then the fate that crushes all
The sweetest pleasures here,
Turned hope's glad music to a sigh,
Its glory to a tear.
It stepped between them; ah! it mocked
The love it could not kill;
It bade them in its fury live,
And love, and suffer still.
They tried with outstretched hands to span
Fate's wide unyielding 'Never.'
The voice of destiny replied:
'Forever and forever.'

Mine is no wild imagined theme,
No idle fancy flight,
It lives through daylight's busy hours,
And haunts the silent night.
The wail of sorrow fills the air,
It rests, it ceases never;
It wrings some soul, it breaks some heart,
Forever and forever.

AUTHOR OF 'IN ALL SHADES,' 'THIS MORTAL COIL,' ETC.

CHAPTER I.—PERADVENTURE.

CHIDDINGWICK High Street is one of the quaintest and most picturesque bits of old-town architecture to be found in England. Narrow at either end, it broadens suddenly near the middle, by a sweeping curve outward, just opposite the *White Horse*, where the weekly cattle-market is held, and where the timbered gable-ends cluster thickest round the ancient stone cross, now reduced as usual to a mere stump or relic. In addition to its High Street, Chiddingwick also possesses a mayor, a corporation, a town pump, an Early English church, a Baptist chapel, and abundant opportunities for alcoholic refreshment. The *White Horse* itself may boast, indeed, of being one of the most famous old coaching inns still remaining in our midst, in spite of railways. And by its big courtyard door, one bright morning in early spring, Mr Edmund Plantagenet, ever bland and self-satisfied, stood sunning his portly person, and surveying the world of the little town as it unrolled itself in changeful panorama before him.

'Who's that driving the rector's pony, Tom?' Mr Plantagenet asked of the hostler in a lordly voice, as a pretty girl went past in an unpretentious trap. 'She's a stranger in Chiddingwick.' For Mr Plantagenet, as one of the oldest inhabitants, prided himself upon knowing, by sight at least, every person in the parish, from Lady Agatha herself to the workhouse children.

Tom removed the straw he was sucking from his mouth for a moment, as he answered, with the contempt of the horsey man for the inferior gentry: 'Oh, *she*! she ain't nobody, sir. That lot's the new governess.'

Mr Plantagenet regarded the lady in the carriage with the passing interest which a gentleman of

his distinction might naturally bestow upon so unimportant a personage. He was a plethoric man, of pompous aspect, and he plumed himself on being a connoisseur in female beauty. 'Not a bad-looking little girl, though, Tom,' he responded condescendingly, closing one eye and scanning her as one might scan a two-year-old filly. 'She holds herself well. I like to see a woman who can sit up straight in her place when she's driving.'

Mr Plantagenet's opinion on all questions of deportment was much respected at Chiddingwick; so Tom made no reply save to chew a little further the meditative straw; while Mr Plantagenet, having by this time sufficiently surveyed the street for all practical purposes, retired into the bar-parlour of the friendly *White Horse* for his regulation morning brandy-and-soda.

But the new governess, all unconscious of the comments she excited, drove placidly on to the principal bookseller and stationer's.

There were not many booksellers' shops in Chiddingwick; people in Surrey import their literature, if any, direct from London. But the one at whose door the pretty governess stopped was the best in the town, and would at least do well enough for the job she wanted. It bore, in fact, the proud legend, 'Wells's Select Library:' then by an obvious afterthought, in smaller letters, 'In connection with Mudie's.' An obsequious small boy rushed up, as she descended, to hold the rector's horse, almost as in the days before compulsory education, when small boys lurked unseen, on the lookout for stray ha'pence, at every street corner. Mary accepted his proffered aid with a sunny smile, and went into the shop carrying a paper parcel.

There was nobody in the place, however, to take her order; and Mary, who was a timid girl, not too sure of her position, stood for a moment irresolute, uncertain how to call the attention of the inmates. Just as she was on the point of giving it up as useless, and retiring discomfited, the door that led into the room behind the shop opened suddenly, and a young man entered. He seemed about nineteen, and he was tall and handsome, with deep blue eyes, and long straggling locks of delicate yellow hair, that fell picturesquely though not affectedly about his ears and shoulders. He somehow reminded Mary of a painted window. She didn't know why, but instinctively, as he entered, she felt as if there were something medieval and romantic about the good-looking shopman. His face was almost statuesquely beautiful—a fair frank open face, like a bonny young sailor's, and the loose curls above were thrown lightly off the tall white forehead in a singularly graceful yet unstudied fashion. He was really quite Florentine. The head altogether was the head of a gentleman, and something more than that: it had the bold and clear-cut, fearless look about it that one seldom finds among our English population, except as the badge of rank and race in the very highest classes. Mary felt half ashamed of herself, indeed, for noting all these things immediately and instinctively about a mere ordinary shopman; for after all, a shopman he was, and nothing more: though his head and face were the head and face of a gentleman of distinction, his dress was simply the every-day dress of his class and occupation. He was a son of the people. And as Mary was herself a daughter of the clergy, the eldest girl of a country rector, compelled by the many mouths and the narrow endowment at home to take a place as governess with a more favoured family at Chiddingwick rectory, she knew she could have no possible right of any sort to take any personal interest in a bookseller's lad, however handsome and yellow-haired and distinguished-looking.

'I beg your pardon for not having come sooner,' the tall young man began in a very cultivated tone, which took Mary aback even more than did his singular and noteworthy appearance; 'but the fact is, you opened the door so very softly the bell didn't ring; and I didn't notice there was anybody in the shop, as I was busy cutting, till I happened to look up accidentally from my ream, and then I saw you. I hope I haven't kept you unnecessarily waiting?'

He spoke like a gentleman; and Mary observed almost without observing it that he didn't call her 'Miss,' though she was hardly even aware of the unusual omission, his manner and address were so perfectly those of a courteous and well-bred equal. If she had fancied the customary title was left out on purpose as a special tribute of disrespect to her position as governess, her sensitive little soul would have been deeply hurt by the slight even from an utter stranger; but she felt instinctively the handsome young man had no such intention. He didn't mean to be anything but perfectly polite, so she hardly even noticed the curious omission.

'Oh dear, no,' she answered, in her timid little voice, unfolding her parcel as she spoke with a kind of shrinking fear that she must be hurting

his feelings by treating him as a tradesman. 'I've only just come in; and I, well, I wanted to know whether you could bind this again for me? Or is it quite too old to be worth the trouble of binding?'

The young man took it from her hands, and looked at her as he took it. The book was a *British Flora*, in two stout octavo volumes, and it had evidently seen wear and tear, for it was tattered and dog-eared. But he received it mechanically, without glancing at it for a moment. His eyes, in fact, were fixed hard on Mary's. A woman knows at once what a man is thinking—especially, of course, when it's herself he's thinking about; and Mary knew that minute the young man with the fine brow and the loose yellow hair was thinking in his own head—how exceedingly pretty she was. That makes a girl blush under any circumstances, and all the more so when the man who thinks it is her social inferior. Now, when Mary blushed, she coloured up to her delicate shell-like ears, which made her look prettier and daintier and more charming than ever; and the young man, withdrawing his eyes guiltily and suddenly—for he, too, knew what that blush must mean—was still further confirmed in his first opinion that she was very pretty.

The young lady, however, was ashamed he should even look at her. He was accustomed to that, and yet somehow in this case it particularly hurt him. He didn't know why, but he wanted her to like him. He took up the book, to cover his confusion, and examined it carefully. 'At the time of the French Revolution,' he observed, as if to himself, in a curious far-away tone, like one who volunteers for no particular reason a piece of general information, 'many of the refugees who came to this country were compelled to take up mechanical work of the commonest description. A Rochefoucauld mended shoes—and Talleyrand was a bookbinder.'

He said it exactly as if it was a casual remark about the volume he was holding, or the comparative merits of cloth and leather, with his eyes intently fixed on the backs of the covers, and his mind to all appearance profoundly absorbed in the alternative contemplation of morocco or russia. Mary thought him the oddest young man she had ever met in her life; she fancied he must be mad, and wondered by what chance of fate or fortune he could ever have wandered into a bookseller's shop at Chiddingwick.

The young man volunteered no more stray remarks about the French Revolution, however, but continued to inspect the backs of the books with more business-like consideration. Then he turned to her quietly: 'We could do this for you very cheap in half-calf,' he said, holding it up. 'It's not at all past mending. I see it's a favourite volume; and a book of reference of the sort you're constantly using in the open air ought to have sound stout edges. The original binding, which was cloth, is quite unsuitable, of course, for such a purpose. If you'll leave it to me, I'll do my best to make a workman-like job of it.'

There was something in the earnest way the young man spoke that made Mary feel he took a pride in his work, simple and ordinary as it

was; and his instant recognition of the needs and object of the particular volume in question, which in point of fact had been her companion in many country rambles over hill or moor, seemed to her singularly different from the perfunctory habit of most common English workmen. To them, a book is just a book to be covered. She conceived in her own mind, therefore, a vague respect at once for the young man's character. But he himself was just then looking down at the volume once more, engaged in examining the inside of the binding. As he turned to the fly-leaf, he gave a sudden little start of intense surprise. 'Tudor!' he murmured; 'Mary Tudor! How very curious! Did this book then once belong to some one named Mary Tudor?'

'It belongs to me, and that's my name,' Mary answered, a little astonished, for he was gazing fixedly at her autograph on the blank page of the first volume. Never before in her experience had any shop people anywhere showed the slightest symptom of surprise at recognition of her royal surname.

The young man made a sudden gesture of curious incredulity. 'I beg your pardon,' he said, jotting down something in pencil in the inside of the book; 'do I understand you to mean your own real name is Mary Tudor?'

'Why, yes, certainly,' Mary answered, much amused at his earnestness. 'That's my own real name, Mary Empsom Tudor.'

He looked at it again. 'What a singular coincidence!' he murmured to himself half inaudibly.

'It's not an uncommon name in Wales,' Mary answered, just to cover the awkwardness, for she was surprised the young man should feel any interest at all in so abstract a subject.

'Oh, that's not it,' the yellow-haired lad replied in a hasty little way. 'The coincidence is—that my name happens to be Richard Plantagenet.'

As he spoke, he drew himself up, and met her gaze once more with conscious pride in his clear blue eye. For a moment their glances answered each other; then both dropped their lids together. But Richard Plantagenet's cheek had flushed crimson meanwhile, as a very fair man's often will, almost like a girl's, and a strange fluttering had seized upon his heart well-nigh before he knew it. This was not remarkable. Mary Tudor was an extremely pretty girl; and her name seemed fateful; but who was she? Who could she be? Why had she happened to come there? Richard Plantagenet determined in his own heart that moment he would surely search this out, and never rest until he had discovered the secret of their encounter.

'You shall have it on Wednesday,' he said, coming back to the book with a sudden drop from cloudland. 'Where may I send it?' This last in the common tone of business.

'To the rectory,' Mary answered, 'addressed to Miss Tudor.' And then Richard knew at once she must be the new governess. His eye wandered to the door. He hadn't noticed till that minute the rectory pony; but once he saw it, he understood all; for Chiddingwick was one of those very small places where every one knows every one else's business. And Fräulein had gone back just three weeks ago to Hanover.

There was a moment's pause: then Mary said,

'Good-morning,' sidling off a little awkwardly; for she thought Richard Plantagenet's manner a trifle embarrassing for a man in his position; and she didn't even feel quite sure he wasn't going to claim relationship with her on the strength of his surname. Now a shopman may be handsome and gentlemanly, and a descendant of kings, but he mustn't aspire to acquaintance on such grounds as these with the family of a clergyman of the Church of England.

'Good-morning,' Richard replied with a courtly bow, like a gentleman of the old school, which indeed he was. 'Your books shall be covered as well as we can do them.'

Mary returned to the pony, and Richard to his ream, which he was cutting into sermon-paper. But Mary Tudor's pretty face seemed to haunt him at his work; and he thought to himself more than once, between the clips of the knife, that if ever he married at all, that was just the sort of girl a descendant of the Plantagenets would like to marry. Yet the last time one of his house had espoused a Tudor, he said to himself very gravely, the relative rôles of man and woman were reversed; for the Tudor was Henry of Richmond, 'called Henry VII., of our younger branch;' and the Plantagenet was Elizabeth of York, his consort. And that was how 'the Estates' went out of the family.

But 'the Estates' were England, Wales, and Ireland.

LIGHTHOUSE ILLUMINANTS.

IN the reign of the first Tudor there existed a respectable Company of Mariners in the College at Deptford, having authority by charter to prosecute persons who destroyed sea-marks, &c. Henry VIII., on May 20, 1514, formed them into a perpetual corporation by the style of the 'Master Wardens and Assistants of the Guild or Fraternity of the most glorious and undivided Trinity, and of St Clement, in the parish of Deptford Strond, in the county of Kent.'

The powers and functions of this Society have been much curtailed by succeeding enactments, and within more recent times again in 1854, the year that gave birth to that master-piece of nautical legislation, the Merchant Shipping Act. But still the Trinity Brethren are an influential body, seeing that amongst other responsibilities they are mainly accountable for the lighting of the storm-swept English coasts.

Between the *phari* of the Romans—established either prior to or in the opening years of the Christian era, on Dover cliffs, Flamborough Head, and various other sites around our shores—and the establishment of the North Foreland Lighthouse, the Dungeness fire-tower, there is practically no connecting link. This last-named beacon was instituted for indicating the whereabouts of the dreaded Goodwin Sands. On the summit of the lighthouse there was built an open fireplace or grate, in which were burnt billets of oak-wood, which subsequently were superseded by coal. Modern science smiles

disdainfully at such a clumsy illuminant; but Smeaton informs us that the coal-fire of the Spurn Point Lighthouse, at the mouth of the Humber, had been seen thirty miles off. Coal-fires issued their warning flares from the Isle of May lighthouse, at the entrance to the Firth of Forth, as late as 1810; while oil was first used in the St Bee's Head Lighthouse in 1823. A beacon-tower that guards the rockbound entrance to a certain Swedish fiord is said to still issue a coal-fed light. Such lights as these must fail conspicuously during tempestuous weather, and especially when the wind blows from sea to shore. A sailor has then to encounter the terrible risks of a lee shore without any perceptible warning from the friendly beacon-light.

As Alfred the Great, according to popular tradition, invented a lantern-like arrangement for the protection of his light-giving time-measurers, another benefactor invented a case or lantern in which to enclose the wood or coal fires of our early light-towers, and so to protect them from storm and tempest. About the year 1732 the iron grate or chaffeur of the Forelands Lighthouse was covered with a 'sort of lantern, on account of the great difficulty of keeping up a proper flame in windy or rainy weather.' The 'lantern' had large sash-windows, and the attendants kept the coal-fire alight by means of huge bellows. In 1790 improvements were instituted which made this lighthouse partake somewhat of its present form and character. The only exceptions to the use of fires were the Eddystone Lighthouse, which used to exhibit a chandelier of twenty-four wax candles, five of which weighed two pounds, and the Liverpool lighthouses, which had oil lamps, with rude reflectors.

The introduction of the Argand lamp about 1790 marked an era of great and rapid improvement in the lighting of beacon-towers. Even at the present day the substance most largely used is oil of one description or other, either colza or petroleum. If the latter oil is used, care is taken to ensure that it is of the best possible quality, and that its flashing point is considerably above the temperature at which most of the petroleum oils give off their dangerous vapours. A sample from every delivery by the contracting oil-merchant is taken and subjected to the most thorough tests; and any consignment that fails to reach the standard is rejected. The usual plan adopted in providing rock lighthouses with their liquid fuel is to give them a fifteen months' supply in advance each year, and thus ensure the impossibility of the supply running short.

The following two extracts, taken from advertisements published by the Commissioners of Irish Lights, will show how the oil supplies are obtained:

'RAPE-SEED OIL FOR LIGHTHOUSES.—The Commissioners of Irish Lights hereby give notice that they are desirous of receiving tenders for the supply of about 15,000 gallons of Pure Refined Rape-seed Oil, of the finest quality, to be delivered into their stores at Kingstown, co. Dublin, in such quantities and at such times as may be required during the year ending 31st December 1892. A sample of Five Gallons of the Oil proposed to be supplied should be submitted by the firms intend-

ing to tender; the vessel containing the sample having the trade or the private mark thereon, but not the name of the firm.'

'MINERAL OIL FOR LIGHTHOUSES.—The Commissioners of Irish Lights hereby give notice that they are prepared to receive tenders for the supply of 38,000 gallons of the finest quality of paraffin oil, to be delivered in the quantities named and at the ports specified.'

The same precautions are adopted with regard to ensuring that the bulk supplied shall be according to sample as obtain in the provision of the colza or rape-seed oil. The latter oil is about twice as costly as the paraffin, but it has an advantage over petroleum that renders it of great use in rock lighthouses. A lighthouse that would consume two gallons of colza in a given time would require twice as much paraffin, and so in lighthouses where storage-room is limited colza has an advantage.

The methods employed to utilise the light given out by the burning oil are two—the catoptric and the dioptric systems. The first named of these necessitates the use of a number of small lamps, each with a polished reflector behind it; while the latter employs one central lamp and an adaptation of lenses. Where gas is used in a lighthouse it has of course to be manufactured with the utmost carefulness; and the use of this illuminant at a shore station necessitates a very material increase of the lighthouse staff.

In the year 1865 Mr J. R. Wigham of Dublin introduced his patent gas burner at the Howth-Bailey Lighthouse, near Dublin. The burner consists of five concentric rings of gas jets, the innermost ring having 28, the next 48, then 68, 88, and the outermost 108, burners. The diameter of each ring was 4, 6½, 8½, 9½, and 11 inches. It is stated that the light from twenty-eight gas jets is equal to four wicks where oil is consumed. By manipulating the strength of the flame—that is, bringing more burners into play—the resulting light can be adjusted to suit the condition of the atmosphere. Fog, the most potent of atmospheric light-quenchers, is less able to extinguish the rays of gas-light than those emanating from any other source. It is sometimes urged in objection to gas as a lighthouse illuminant that it is impossible to direct *all* the light, that the well-known gas glare cannot be obviated even with the most perfect dioptric apparatus and its appurtenances. But this is hardly an important objection, after all. The zone of vague illumination, the result of the action of the ex-focal rays, serves to reveal in dense weather the whereabouts of the friendly lighthouse, although the optical opacity of the atmosphere may be such as to quench all the directed rays. The cost of lighthouse gas is said to average about ten shillings per thousand cubic feet. This is, of course, far above the cost of a similar quantity of coal-gas manufactured for domestic purposes. This is accounted for by the small quantity made at each station, and also by the best possible varieties of cannel coal being employed in the process. The relative intensities of this special coal-gas compared with the gas designed for domestic consumption is as thirty-five is to sixteen.

Professor Tyndall thus pronounces upon the merits of gas as a lighthouse illuminant: 'It may be beaten in point of cheapness by mineral oil;

but in point of handiness, distinctiveness, and power of variability to meet the changes of the weather, it will maintain its superiority over all oils.

With regard to the electric light much was expected. Its intensity was such that many asserted it would shine steadily and distinctly through all conditions of atmosphere. But such expectations have met with disappointment. Vivid it is, and searching it may be; but its utter inability to penetrate through a fog of any density, the stranding of the *Eider* well within the zone of St Catherine's electric light most wofully demonstrates. Here was a light which, under clear conditions of weather, shines with almost solar brilliancy, quite powerless to penetrate the layers of partially condensed aqueous vapour that lay between the lighthouse and the German liner. The electric light with its matchless intensity is doomed so far as its reputation as a lighthouse illuminant is concerned.

The Shipmasters' Society, whose members have to do with the practical side of lighthouse economics, thus wrote to Trinity House in March 1891: 'Many members of this Society on active service frequently passing from the Thames to sea, and *vice versa*, have often represented the poorness, sometimes invisibility, of the electric lights during certain conditions of hazy atmosphere, at times when the oil-lights of light-ships, &c., and the gas-lights of seaside towns have been comparatively bright and distinct. Again, complaints have been made of the intense and blinding effects produced on navigators by electric light such as the South Foreland on vessels in its immediate vicinity.' This is the opinion of those mainly concerned in the efficacy of our warning lights, whose very lives depend upon the vividness of the friendly rays emerging from the lantern-towers that line our coasts. This verdict is endorsed by nautical opinion in the United States, where those interested in the question of good lighting have requested that the electric lights be withdrawn.

The French lighthouse authorities are much dissatisfied also with the performance of the electric light as an electric illuminant. The electric arc has served to illumine many of their houses for many years; but the complaints of practical navigators have caused the French engineers of the Lighthouse Department to look out for a suitable substitute.

One service the electric light performs for the mariner in a truly noble manner is that of sky-flash-signals. A beam of light thrown into the upper sky is extremely useful to navigators in determining a ship's position before the true light itself is visible over the convexity of the earth. The value of such a light will be understood by all. Supposing a ship making for shore sights an overhead light, she is enabled to locate her position thereby. If bad weather were now to come on, she would be able to steer in confidence in the direction of the true light, and would come within its range, although, had she not been guided by seeing the overhead light ere the bad weather came on, she would have had to grope her way until well within the zone of the true light. In many conditions of weather, though, the vertical beam would not be of the slightest use, as may readily be imagined. St Catherine's

flash-light has been seen at a distance of forty-nine miles, while sky-flashes of the Hollman Light on the coast of Denmark have been discerned at a distance of fifty-one miles. Creech Point Light, Ushant, has been seen forty-one miles away; and the sky-flash from Calais has been seen thirty-six miles away.

Light is, however, not only thrown from some lighthouses upon the sky, but at many there are subsidiary beams which are used to throw light upon some danger-spot in the immediate vicinity of the lighthouse. Coloured lights are generally employed for this purpose. But their use is attended with so much loss of power, that it is but rarely that they are employed as first-class principal lights. Red is more frequently used than green, and the latter colour is not used as a *main* feature in any lighthouse. If a red beam of light is to produce the same effect at the same distance as a beam of white light, then the quantitative ratio of the lights that produce the beams must be as twenty-one is to nine, the extra amount of light being required for the red beam, to compensate for the light absorbed in passing through the red glass. The importance of the work achieved by these subsidiary beams is exemplified by the Coquet Island Lighthouse, off the coast of Northumberland. The surrounding sea is divided into eight irregular areas, each area being marked in a distinct manner: the main or seaward portion is of course the largest, having an illuminated arc of one hundred and eighty degrees. The other areas are of course much smaller in extent. Vertical strips of variously-coloured glass, through which the light is made to pass, illumine the different areas in a most marked manner, the diversity of characteristics being aided by a tower-light in the same tower twenty-eight feet below the main light.

We have already, in alluding to the introduction of gas into lighthouses, mentioned the work of Mr Wigham. Whatever debt he had laid the British nation under by his researches into the question of lighthouse illuminants will be materially increased by his latest contribution to the practically scientific side of the question. He has recently introduced to the world his 'Giant Lighthouse Lens,' which promises to advance the science of lighthouse illumination far beyond its present limits. In the year 1885 a step in the direction of large lenses was taken by the Commissioners of Irish Lights when they established at Mew Island Lighthouse, Belfast Lough, lenses four feet high by three feet seven inches in width, but still with the 920 millimetre focal distance. Experiments were afterwards made at South Foreland with large lenses; and Messrs Stevenson next obtained the sanction of the Board of Trade to the purchase of a larger lens than that of Mew Island for experimental purposes. The focal distance of this lens was 1330 millimetres. By Messrs Stevenson it was termed a hyper-radiant lens; and it was found, when used in conjunction with large burners, to have practically double the illuminating power of any lens previously made. Finality was now thought to be reached, and it was asserted that by the use of such lenses an amount of light would be obtained equal to that given by the superposition of a number of smaller lenses.

But Mr Wigham went farther, and urged upon the Irish Commissioners the advisability of still increasing the amount of light emitted from light-houses. Messrs Stevenson expressed the opinion that such lenses should be restricted to a single tier of glasses; and the Board of Trade also urged the Irish Commissioners that it was inexpedient to adopt any higher optical power with these lenses than the triform. Mr Wigham's recommendation, however, was acted upon. Not only was the feasibility of manufacturing a larger lens demonstrated, but the best method of adapting it was shown as well. This giant lens has a focal length of two metres. When this splendid triumph of lenticular art is set up in the quadrilateral system, each of the four faces of the apparatus measures ten feet wide by twenty-two and a half feet in height. The axial intensity of the 'giant' lens is eight hundred thousand candles; and when fully equipped, the emergent beam of light from the quadrilateral arrangement is calculated at five million candles. In making this computation, allowance has not been made for the fact that the peculiar spherical form of the lens will return to the flame the whole of the light reflected at the first refracting surface, so as to increase the amount of light emitted directly from the flame towards an opposite panel, which light in the case of an ordinary plane lens is wholly lost. The apparatus in question can easily be accommodated in a lantern of ordinary dimensions, as it is only fourteen and a half feet in diameter, thus requiring a lantern some three feet greater from side to side.

With such a lenticular arrangement as this and a powerful gas flame, the cry of the steamship companies for a light of great power on the Old Head of Kinsale will soon be granted. The fleets of vessels that then 'make' the south-west coast of Ireland, after crossing the Atlantic, will know that human skill and knowledge have provided them with a warning light as perfect and powerful as human ingenuity can devise. Moreover, the ex-focal light will be diffused to a greater extent than it was before; and although no lighthouse illuminant has yet been produced that can satisfactorily penetrate fog, yet this ex-focal light obtained as a useful quantity when gas is burnt, may be relied upon to illumine the fog to some extent, and so show the approximate position of the friendly lighthouse.

Concerning the electric light, it has been a subject of much controversy as to which nation first employed it as a lighthouse illuminant. On December 26, 1863, the South Lighthouse at Cape La Hève in France was lighted experimentally by electricity. But this was nearly two years after its permanent adoption in this country. So far back as 1857, experimental trials were made; and after burning at South Foreland during 1857, 1858, and 1859, it was agreed to replace the oil by electricity at the dangerous point of Dungeness, on the coast of Kent. Some difficulties of detail, however, had to be overcome; and it was not until February 1, 1862, that the electric light shone from the historical tower of Dungeness.

Since that date, the electric light has had a fair trial, and under certain conditions of atmosphere its powerful rays are found to be completely quenched. Now that all authorities are agreed

upon this point, it remains to be seen what impulse the failure of the electric light will give to the development of large lenticular surfaces, and how far coal-gas will be used as the illuminant of the future.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXIV.—ELSIE AND HER MOTHER.

'CAN you spare me a few minutes, mother?'

Mrs Arundel looked up from the desk where she was writing a letter, and saw her daughter standing before her. She started and changed colour, but quickly recovered, and replied coldly: 'I did not hear you come in, Elsie. What do you want with me?'

Outside, the bells were ringing for Church: it was a quarter to eleven: Mrs Arundel was already dressed for Church. She was one of those who do not see any incongruity between Church and a heart full of animosities. She was bitter against her daughter, and hard towards her son, and she hated her son-in-law elect with all the powers of her passionate nature. But, my brothers, what an array of bare benches should we see in every place of worship were those only admitted who came with hearts of charity and love!

'Do you wish to keep me long, Elsie? If so, we will sit down. If not, I am ready for Church, and I do not like to arrive late. People in our position should show a good example.'

'I do not think that I shall keep you very long. But if you sit down, you will be so much more comfortable.'

'Comfort, Elsie, you have driven out of this house.'

'I will bring it back with me, then. On Monday evening, mother, I am coming back.'

'Oh! What do you mean, child? Has the blow really fallen? I heard that it was impending. Is the young man—is he—a prisoner?'

'No, mother. You are quite mistaken. You have been mistaken all along. Yet I shall come back on Monday.'

'Alone, then?'

'I shall leave it to you whether I come back alone, or with the two men whom I most regard of all the world—my lover and my brother.'

'You know my opinions, Elsie. There has been no change in them. There can be none.'

'Wednesday is my wedding day.'

'I am not interested in that event, Elsie. After your wedding with such a man, against the opinions, the wishes, the commands of all whom you are bound to respect, I can only say that you are no longer my daughter.'

'Oh! How can you be so fixed in such a belief? Mother, let me make one more appeal to your better feelings. Throw off these suspicions. Believe me, they are baseless. There is not the shadow of a foundation for this ridiculous structure they have raised. Consider. It is now—how long?—three weeks since they brought this charge, and they have proved nothing—absolutely nothing. If you would only be brought to see

* Copyright 1892 in the United States of America by Harper & Brothers.

on what false assumptions the whole thing rests !'

'On solid foundations—hard facts—I want no more.'

'If I could prove to you that Athelstan was in America until a month ago.'

'Unhappy girl! He is deceiving you. He has been living for eight years in profligacy near London. Elsie, do not waste my time. It should be enough for me that my son-in-law, Sir Samuel Dering, a man of the clearest head and widest experience, is convinced that it is impossible to draw any other conclusions.'

'It is enough for me,' Elsie rejoined, quickly, 'that my heart tells me that my brother and my lover cannot be such creatures.'

'You have something more to say, I suppose.' Mrs Arundel buttoned her gloves. The clock was now at five minutes before eleven.

'Yes. If it is no use at all trying to appeal to'—

'No use at all,' Mrs Arundel snapped. 'I am not disposed for sentimental nonsense.'

'I am sorry, because you will be sorry afterwards.—Well, then, I have come to tell you that I have made all the preparations, with George's assistance, for Wednesday.'

'Oh !'

'Yes. The wedding cake will be sent in on Tuesday. My own dress—white satin, of course, very beautiful—is finished and tried on. It will be sent in on Monday evening. The two bridesmaids' dresses will also come on Monday. George has arranged at the Church. He has ordered the carriages and the bouquets and has got the ring. The presents you have already in the house. We shall be married at three. There will be a little gathering of the cousins after the wedding, and you will give them a little simple dinner in the evening, which will, I daresay, end with a little dance. George has also seen to the red cloth for the steps and all that. Oh ! And on Tuesday evening you will give a big dinner party to everybody.'

'Are you gone quite mad, Elsie?'

'Not mad at all, my dear mother. It is Sir Samuel who is mad, and has driven you and Hilda mad. Oh ! everything will come off exactly as I tell you. Perhaps you don't believe it.'

'You are mad, Elsie. You are certainly mad.'

'No, my dear mother, I am not mad. Oh ! it is so absurd, if it were not so serious. But we are determined, George and I, not to make this absurdity the cause of lasting bitterness. Therefore, my dear mother, I do not want to be married from my brother's lodgings, but from your house. You will come to my wedding, I prophesy, full of love—full of love'—her eyes filled with tears—'for me and for George—and for Athelstan—full of love and of sorrow and of self-reproach. I am to be given away by my brother—you will come, I say, with a heart full of love and of pity for him.'

Mrs Arundel gazed at her stonily.

'Everybody will be there, and you will receive all your friends after the wedding. I have taken care of the invitations. Hilda will be there too, horribly ashamed of herself. It will be a lovely wedding ; and we shall go away with such good wishes from yourself as you would not in your

present state of mind believe possible.—Go now to Church, my dear mother, prepared for a happy and a joyful day.'

'I sometimes believe, Elsie,' said Mrs Arundel, more coldly still, 'that you have been deprived of your senses. So far from this, I shall not be present at your wedding. I will not interfere with your holding your marriage here, if you like ; you may fill the house with your friends, if you please. I shall myself take shelter with my more dutiful daughter. I refuse to meet my unhappy son : I will not be a consenting party to the tie which will entail a lifelong misery'—

'My dear mother—you will do everything exactly as I have prophesied.—Now, do not say any more, because it will only make our reconciliation a little more difficult. I ought to go to Church on the Sunday before my wedding, if any day in the week. If you would only recover your trust in my lover's honour, I could go to Church with you and kneel beside you. But without that trust— Oh ! go, my dear mother. You will find my prophecy come true, word for word—believe me or not.'

Mrs Arundel went to Church. During the service she felt strange prickings of foreboding and of compunction and of fear, anxiety, and hope, with a little sadness, caused by the communication and the assurances of her daughter. Even in such a case as this, the thinker of evil is sometimes depressed by the arrival of the prophet of good. When Mrs Arundel came away from Church, she became aware that she had not heard one single word of the sermon. Not that she wanted very much to hear the sermon, any more than the First or Second Lesson—all three being parts of the whole which every person of respectability must hear once a week. Only, it was disquieting to come away after half an hour's discourse with the feeling that she did not remember a single syllable of it. She took her early dinner with the other daughter, to whom she communicated Elsie's remarkable conduct, and her prediction and her invitation. It was decided between them that her brain was affected—no doubt, only for a time—and that it was not expedient for them to interfere ; that it was deplorable, but a part of what might have been expected ; and that time would show. Meanwhile, Sir Samuel reported that it had been resolved to get a warrant for the arrest of the man Edmund Gray, who hitherto had eluded all attempts to find him.

'He appears to be a real person,' the knight concluded—'an elderly man, whose character, so far as we can learn, is good. It is, however, significant that nothing has been discovered concerning his profession or calling. That is mysterious. For my own part, I like to know how a man earns his daily bread. I have even consulted a person connected with the Police. Nothing is known or suspected about him. But we shall see as soon as he is before the magistrate.'

'And Wednesday is so close ! Oh ! my dear Sir Samuel, hurry them up. Even at the last moment—even at the risk of a terrible scandal—if Elsie could be saved !'

'Well,' said Sir Samuel, 'it is curious—I don't understand it—we had arranged for the application for a warrant for Friday morning. Would you believe it ? That old donkey Checkley won't

go for it—wants it put off—says he thinks it will be of no use. What with this young man Austin at first, and this old man Checkley next, we seem in a conspiracy to defeat the ends of justice. But to-morrow I shall go myself to my brother. It is time this business was finished.'

'Yes—yes,' said Mrs Arundel. 'And my dear Sir Samuel, before Wednesday—let it be before Wednesday, I implore you, for all our sakes!'

'My dear Madam, it shall be to-morrow.'

At noon, Elsie returned to Half Moon Street, where George was waiting for her.

'I have made one more attempt,' she said, with tears; 'but it was useless. Her head is as hard about you as ever it was about Athelstan. It is wonderful that she should have so little faith. I suppose it comes of going into the City and trying to make money. Edmund Gray would say so. I would have told her all, but for the old man's sake. He knows nothing: he suspects nothing; and I want to make the case so complete that there shall be no doubt—none whatever—possible in the minds of the most suspicious. Even Checkley must be satisfied. I shall finish the work, I hope, this afternoon.—Oh! George—is it possible? Is our wedding day next Wednesday—actually next Wednesday? And the hateful cloud shall be blown away, and—and—'

For the rest of this Chapter look into the Book of Holy Kisses, where you will very likely find it.

CHAPTER XXXV.—PLENARY CONFESSION.

Early on Sunday afternoon Elsie started upon her mission. She was anxious, because she was entering upon a most important business, and one requiring the greatest delicacy in the handling. It was enough—more than enough—that her witnesses should be able, one after the other, to identify Mr Dering with Mr Edmund Gray: but how much more would her hands be strengthened if she could produce a full and complete narrative of the whole affair, written by the hand which had done it all! To get that narrative was her business with the Master that afternoon. But she was hopeful, partly because she knew her power over the philosopher; and partly because, like every woman who respects herself, she had always been accustomed to get exactly what she wanted, either by asking, coaxing, flattering, or taking.

The Master was waiting for her—one should never keep a Master waiting—and she was a little late: he was impatient: he had so much to talk about and to teach: one point suggested another in his mind: so much to say: he grudged the least delay: he walked about the room chafing because the hour appointed was already five minutes in the past: he would scold her: she must really learn to be punctual: they had only about five short hours before them for all he had to say. Was this the zeal of a student? But at that point she opened the door and ran in, breathless, smiling, eager, holding out both her hands, a dainty delicate maiden all his own—his disciple—his daughter—the daughter of the New Humanity—and he forgot his irritation, and took her hands in his and kissed her forehead. 'Child,' he sighed, 'you are late. But never

mind. You are here. Why, you have grown so precious to me that I cannot bear you to be a minute late. It is such a happiness—such a joy in the present—such a promise for the future—that I have such a disciple! Now sit down—take off your bonnet. I have put a chair for you at the window—and a table for you to write. Here is your note-book.—Now—you have thought over what I taught you last?—That is well. Let us resume at the point where we left off—the rise of the co-operative spirit, which is the rise of the New Humanity.'

He talked for two hours—two long eloquent hours: he walked about the room: or he stopped before his disciple emphasising with the forefinger of admonition—repeating—illustrating by anecdote and memory—he had a prodigious memory. The Scholar listened intelligently. Sometimes she asked a question: sometimes she made notes. You must not think that she was a sham Scholar: her interest in the Master's system was not simulated. Above all things, she loved to hear this enthusiast talk—who would not love to hear of the New Jerusalem? Always he made her heart to glow with the Vision that he conjured up before her eyes of a world where there should be no more sorrow nor crying nor any more pain, nor any of the former things. He made her actually see—what others only read of—the Four-square City itself with its gates open night and day, its jasper walls, and its twelve foundations of precious stones.—'Why,' he said, 'the gates are open night and day because there is no Property to defend; and the walls are of jasper because it is the most beautiful of minerals, and because it can be polished like a mirror, so that the country around is reflected on its surface, which shows that it all belongs to the City; and the precious stones are the twelve cardinal virtues of Humanity, on which the Order of the Future shall rest—namely, Faith, Brotherly Love, Obedience, Patience, Loyalty, Constancy, Chastity, Courage, Hope, Simplicity, Tenderness, and Industry. It is an allegory—the whole book is an allegory—of Humanity.' And she saw, beside the City, the river of life, with the tree of life for the healing of all nations.

Then she clean forgot the purpose for which she had come: she was carried away: her heart beat—her cheek glowed. Oh! Lovely Vision! Oh! Great and glorious Prophet! He made a Heaven, and placed it on this earth. Now the mind of man can conceive of no other happiness but that which humanity can make out of the actual materials found upon this earthly ball. The Heaven, even of the most spiritual, is a glorified world: the Hell, even of the most gentle, is a world of fleshly pain: no other Heaven attracts: no other Hell terrifies: there is no promise, or hope, or prospect, or inheritance that man desires or poet can feign or visionary can preach but an earthly Heaven: it must be a Heaven containing sunshine and shower, kindly fruits in due season, love and joy and music and art, and men and women who love each other and labour for each other. Such a world—such a New Jerusalem—the Master drew every day; he loved it, and lingered over it; he painted over and over again this splendid Vision. He was never tired of painting it, or his hearers of gazing upon it. But to-day, he spoke with greater fullness,

more clearly, more brilliantly, more joyously than ever. Was the Prophet really a man of seventy years and more? For his mind was young—the enthusiast, like the poet, never grows old. His voice might have been the voice of a boy—a marvellous boy—a Shelley—preaching the glories of the world when Property should be no more.

He ceased. And the Vision which he had raised quickly faded away. They were back again in the dingy old Inn: they were among the solicitors and the money-lenders and the young fellows who have their Chambers in the place. The Inn is about as far from the New Jerusalem as any place under the sun: it is made over bodily and belongs—every stair—every chamber—to the interests of Property.

He ceased his prophecy, and began to argue, to reason, to chop logic, which was not by any means so interesting. At last he stopped this as well. 'You have now, dear child,' he said, 'heard quite as much as you can profitably absorb. I have noticed for the last two or three minutes your eyes wandering and your attention wearied. Let us stop—only remember what I have just said about the diseases of the Body Politic. They are akin to those that affect the human body. By comparing the two we may learn not only cause, but also effect. We have our rheumatisms, gouts, asthmas, neuralgias, colds and coughs, fevers and other ills. So has the Body Politic. Whence come our diseases? From the ignorance, the follies, the vices, the greed and gluttony of our forefathers. So those of the Body Politic. Take away Property and you destroy greed. With that, half the diseases vanish.'

Elsie heard and inclined her head. It did occur to her that perhaps Property in the Body Politic might be represented by food in the Body Human, but she forbore. The Master was one who did not invite argument. Nearly all the great Teachers of the world, if you think of it, have conveyed their wisdom in maxims and aphorisms.

He took out his watch. 'It is nearly four,' he said. 'Shall we go on to the Hall?'

'Not yet. There is no need for us to be there before six. We have two good hours before us. Let us use them more pleasantly than in sitting alone in the Hall—you must own that it is stuffy. We will talk about other things—about ourselves—not about me, because I am quite an insignificant person, but about you, dear Master.' She was now about to enter upon her plan of duplicity. She felt horribly ashamed, but it had to be done. She strengthened herself: she resolved: she suppressed the voice of conscience.

'About me?' asked the Master. 'But what is there to talk about?'

'Oh! there is ever so much.' She took his right hand in her own and held it, knowing that this little caress pleased and moved him. 'Master—what a wonderful chance it was that brought me here! I can never sufficiently wonder at it. I have told George—George Austin—my lover, you know: and Athelstan—he is my brother.' She looked at him sharply, but there was no sign of recognition of those two names. Edmund Gray had never heard of either. 'I have told them about you and of your great work, and how you are teaching me and everything. But when they ask me who you are,

where you have lived, and all about you, I can tell them nothing. Oh! I know it matters nothing about me and my own friends; but, my dear Master, we have to think of the future. When the Cause has spread, and spread, and spread, till it covers the whole world, people will want to know all about the man who first preached its principles. Who will be able to tell them? No one. You are alone: you have no wife or children. Your name will remain for ever attached to the Cause itself. But you—you—the man—what will you be? Nothing. Nothing but a name. You ought to write an autobiography.'

'I have sometimes thought I would do so'—his face became troubled; 'but—but'—

'But you are always occupied with working for the world. You have no time, of course. I quite understand that; and it worries you—does it not?—to be called upon to turn your thoughts from the present back to the past.'

'Yes—yes; it does—it does. Elsie, you exactly express the difficulty.'

'And yet—you must own—you must confess—it is natural for the world to want to know all about you. Who was the great Edmund Gray? Why, they will want to know every particular—every single particular: where you were born—where you were educated—who were your masters—what led you to the study of Humanity and its problems—where you lived: if you were married and to whom—what you read—who were your friends. Oh! there is no end to the curiosity of the world about their great men.'

'Perhaps.' He rose and looked out of the window. When men are greatly pleased they must always be moving. 'I confess that I have never thought of these things at all. Yet, to be sure—you are right.' He murmured and purred.

'No, but I have thought of them, ever since I had the happiness of being received by you. Master, will you trust me? Shall I become your biographer? You cannot find one more loving. You have only to give me the materials. Now—let me ask you a few questions just for a beginning—just to show you the kind of thing I shall want to know.'

He laughed and sat down again. 'Why, my life has not got in it one single solitary incident, or episode, or adventure. There are no misfortunes in it. There is not such a thing as a disease in it. I have always been perfectly well. There is not even a love episode or a flirtation in it. There are not even any religious difficulties in it. Without love, ill-health, misfortune, religious doubts—where is the interest in the life, and what is there to tell?'

'Well, a life that has no incident in it must be the life of a student. It is only a student who never falls in love.'

'Or,' said the Philosopher, 'a money-getter.'

'Happily, there are not many students, or we women should be disconsolate indeed. Do you know, Master, that you can only be excused such a dreadful omission in your history by that one plea? Sit down again, Master,' for again he was walking about restlessly, partly disturbed by her questions, and partly flattered and pleased by her reasons. She opened her note-book and began to ask questions about himself—very simple

questions, such as would not introduce any disturbing points. He answered readily, and she observed with interest that he gave correctly the facts of his own—Edward Dering's—history.

He was born, he said, in that class which upholds Property—the Better Class—meaning the Richer. His father was a wealthy solicitor, who lived in Bedford Row. He was born in the year 1815—Waterloo year. He was the eldest of a family of five—three daughters and two sons. He was educated at Westminster. On leaving school, his father offered him the advantage of a University course, but he refused, being anxious to begin as early as possible his life's work—as he thought—in the defence of Property. He was therefore articled to his father; and at the age of twenty-two he passed his examination and was admitted.

'And then you were young—you were not yet a student—you went into society. You saw girls and danced with them. Yet you never fell in love, and were never married. How strange! I thought everybody wanted love. A man's real life only begins, I have always been taught, with love and marriage. Love means everything.'

'To you, my child, no doubt it does. Such as you are born for love,' he added gallantly. 'Venus herself smiles in your eyes and sits upon your lips. But as for me, I was always studious more or less, though I did not for long find out my true line. I worked hard—I went out very little. I was cold by nature, perhaps. I had no time to think about such things. Now, when it is too late, I regret the loss of the experience. Doubtless if I had that experience I should have gained greatly in the power of persuasion. I should have a much more potent influence over the women among my hearers. If I were a married man I should be much more in sympathy with them.'

'No—no—no.' Elsie hesitated a little. 'Perhaps women—especially the younger kind—get on better with unmarried men. However, you were not married.'

'At first, then, I was a solicitor with my father. Then—presently'—His face put on the troubled look again.

'You continued,' Elsie interrupted quickly, 'to work at your profession, though you took up other studies.'

'No—no—not quite that.'

'You began to take up Social problems, and gradually abandoned your profession.'

'No—no—not that either—quite.'

'You found you could not reconcile your conscience any longer to defending Property.'

'No—I forget exactly. It is strange that one should forget a thing so simple. I am growing old, I suppose.—Well—it matters not. I left the profession. That is the only important thing to remember. That I did so, these Chambers prove. I came out of it. Yes, that was it. Just at the moment, my head being full of other things, I cannot remember the exact time, or the manner of my leaving the profession. I forget the circumstances, probably because I attached so little importance to it. The real point is that I came out of it and gave myself up to these studies.'

She noted this important point carefully and looked up for more.

'There, my dear child, is my whole life for you.

Without an incident or an episode. I was born: I went to school: I became a solicitor: I gave up my profession: I studied social economy: I made my great discovery: I preached it. Then—did I say my life was without an episode and without love? No—no—I was wrong. My daughter—I have at last found love and a child—and a disciple. What more have I to ask?'

'My Master!' No daughter could be more in sympathy with him than this girl.

'It is all most valuable and interesting,' she said, 'though the facts are so few. Books will be written, in the future, on these facts, which will be filled out with conjecture and inference. Even the things that you think of so little importance will be made the subject of comment and criticism. Well—but my Biography of you will be the first and best and most important. I shall first make a skeleton life out of the facts, and then fill in the flesh and blood and put on the clothes, and present you, dear Master, just as you are.'

'Ask me what you will, but not too often. It worries me to remember the past. My dear, I am like a man who has made himself—who has risen from the gutter. He cannot deny the fact, but he doesn't like to be talking about it; and he is insulted if any one charges him with the fact or alludes to it in any way in his presence. That is my case exactly. I have made myself. I have raised myself from the gutter—the gutter of Property. I actually worked in defence of Property till I was sixty years old and more. Now I am rather ashamed of that fact. I do not deny it—you must put it into your Biography—but I do not like talking about it.'

'You were once a solicitor, and you are now a Prophet. What a leap! What a wonderful leap! I quite understand. Yet sometimes, now and then, for the sake of the curious impertinent world, look back and tell me what you see.'

'I suppose it is because I am so absorbed in my work that it is difficult for me to remember things. Why, Elsie, day after day, from morning to evening, I sit here at work. And in the evening I remember nothing of the flight of time. The hours strike, but I hear them not. Only the books on the table show what has been my occupation. And you want me to go back, not to yesterday, but ten, twenty, thirty years ago. My dear child, I cannot. Some of the past is clear to me—a day here and there I remember clearly—all my evenings at the Hall of Science: my lessons with you: those I remember. But to recall days passed in meditation and absorbing study is not possible. No—no—I cannot even try.'

He spoke with a little distress, as if the very thought of the necessary effort troubled him.

'Believe me, my dear Master,' said Elsie, 'I would not vex you. Only for some of the things which you do remember. For instance, the world always wants to know about the private fortunes of its great men. Your own affairs, you told me once, are in the hands of a—Mr—Mr—what is his name?'

'Dering—Dering. A very well known solicitor. His office is in New Square, Lincoln's Inn—he manages my money matters. I am, I believe, what the world calls wealthy.'

'That gives you independence and the power of working for Humanity, does it not?'

'It does,' said the Scourge and Destroyer

of Property, unconscious of the incongruity. 'Dering, my solicitor, is, I believe, a very honest man. Narrow in his views—wedded to the old school—quite unable to see the advance of the tide. But trustworthy. He belongs to a tribe which is indispensable so long as Property is suffered to exist.'

'Yes—only so long. Property and lawyers will go out hand in hand.'

'And magistrates,' he added with enthusiasm. 'And Courts of Justice and prisons. And criminals, because the chief incentive to crime will be destroyed. What a glorious world without a law, or a lawyer, or a policeman!'

'Mr Dering, is it? Why, my dear Master, I know something about Mr Dering. My brother Athelstan was articled to him. He became a managing clerk for him. Then there was trouble about a cheque. Something was wrong about it. He was unjustly blamed or suspected, and he left the House. I wonder, now, whether you could throw any light upon that business of the cheque?'

'I, my dear child? A single solitary cheque at a lawyer's office? How should I possibly know anything about it?'

'Oh! but you might remember this cheque, because, now I think of it, your own name was connected with it. Yes—it was. I am certain it was. The cheque was drawn in March in the year 1882—a cheque for seven hundred and twenty pounds, payable to your order—the order of Edmund Gray.'

'A cheque for seven hundred and twenty pounds? In March 1882? That must have been: yes—yes—that was about the time. Now, this is really most remarkable, child, most remarkable that you should actually hit upon a cheque—one of thousands issued from that office—which I should remember perfectly. Life is full of coincidences—one is always hearing odd things said, meeting faces which one knows.—Well, it is most remarkable, because I received a cheque for that very amount at that very time from Dering. Oh! I remember perfectly. It was when I had a scheme—I thought it then, being younger than I am now—a very good scheme indeed. It was intended for the gradual destruction of Property. I did not understand at that time so fully as I do now the rising of the tide and the direction of the current which is steadily advancing to overwhelm Property without any feeble efforts on my part. Yet my scheme was good so far as it went, and it might have been started with good effect, but for the apathy of the workers. You see, they were not educated up to it. I had already begun upon my scheme by advancing to certain working men sums which should make them independent of their employers until they should have produced enough to sell directly, without the aid of an employer, at their own co-operative stores. Unfortunately, most of them drank the money: the few who used it properly, instead of backing up their fellow-workmen, became themselves employers, and are now wealthy. Well, I thought I would extend this method. I thought that if I got together a chosen band—say, of seventy or so—and if, after teaching them and educating them a bit, I gave them, say, ten pounds apiece, to tide them over the first few weeks, that I

might next open a distributive and co-operative store for them, and so take the first step to abolishing the middle-man—the man of trade.'

'I see; and so you drew the money for that purpose?'

'Yes. But, as I told you, I was obliged to abandon my scheme. The men were not sufficiently advanced. They listened: they professed great willingness to receive the money; but they gave me no encouragement to hope that they would carry out my plan. So it fell through. And the men remain to this day with their employers. And so—you see—I never used the money. I remember that I had the cheque cashed in ten-pound notes for the purpose.'

'What became of the notes?'

'I don't know. They are in the Bank, I suppose—wandering about the world. I gave them back to Dering.'

'Oh! my dear Master'—Elsie sprang to her feet and laid a sheet of paper on the table—'this is most Providential! I cannot tell you what a dreadful cause of trouble this cheque has been to us. It has half ruined my brother's life. For Heaven's sake, write it all down for me. Quick! quick! before you forget it all.'

AUSTRALIAN SHARK TALES.

In a previous page of this *Journal* (p. 540), in an article on 'Australian Snake Yarns,' the writer referred shortly to the most common members of the snake family in Australia. In the present number I may be permitted to refer to the Sharks which frequent our coasts and harbours. We have plenty of fine fish here; and fishing is a pastime that is thoroughly enjoyed along our coastal towns. The shark is the pest of the fisherman. He eats the bait. He catches himself on the hook, and the fisherman has a hard and dirty fight to kill the shark and to remove the hook. He makes boating dangerous, and sea-bathing to be avoided, so far at least as the open sea is concerned. In offering this contribution, I do not pose as a naturalist. My knowledge of sharks is not greater than that of any newspaper reader. I have been informed that they are warm-blooded, with seven rows of erectile teeth, and that they are very voracious. I have heard that they will not eat a black man, but that they are particularly attentive to a white one if he happens to get into the water. What I wish my readers to understand is that I have a friend and neighbour who is by trade a diver. The following tales come directly from his lips to my ears. My friend the diver is passably educated, sober, hard-working, intelligent, and observant. His duties are varied and various. At one time he is engaged on a sunken ship; at another at a sunken rock. He may be deepening a channel, enlarging a harbour, or laying the foundation of a bridge. He may possibly be engaged in 'jumping' a hole in the solid rock, and then inserting a charge of dynamite. The dynamite is discharged by electricity, the diver having taken care in the meantime to remove himself sufficiently from the scene of action.

It is not necessary here to do more than to refer to the diver's dress. There are weights on the feet by which the diver can move about at the bottom; there is a helmet upon the head. The hands are bare, the sleeve of the dress being confined at the wrist by an elastic band. Air is pumped down from a boat on the surface, and the respired air escapes by a valve. The wages of my friend the diver are twenty shillings per day. This sum is probably larger than the wages of one who follows a similar occupation at 'home.' The reason of the difference is not hard to ascertain. In Australia, the reward of labour is higher generally, and the dangers of this particular profession are considerably greater than those attending divers around the coast of Great Britain and Ireland. First, in fancy at all events, among these dangers are those attributable to sharks. And here I draw upon the observation and address you in the language of my friend the diver:

Sharks are very common all along the coast of Australia. They become more numerous, larger, and more voracious the nearer we go to the equator. Passengers who make ocean voyages may often see them from the deck of their ship; but I see them in their native element. A day seldom passes when I am at work that I do not see some of these creatures. They do not seem to recognise a diver when clad in his diving dress as something which is good to eat. Probably he is mistaken for some other great sea-monster, with whom the shark would just as soon not measure his strength. At all events sharks rarely give us any active annoyance. At first, when we go into a new country, they exhibit some curiosity. They sometimes come and inspect us and our work, moving slowly around us without perceptible motion, and smelling at us like great dogs. It gives one a very horrible 'feeling of insecurity,' I assure you, when one of these monsters of twelve or fourteen feet long runs his nose around your body, and without even a solitary 'wag' of his tail to indicate good-fellowship. The shark will swim away right enough when he has finished his inspection—at least, he always has done so with me—and although annoying, I can stand it now. Sometimes, when you go down of a morning, you will find half-a-dozen big and little sharks who have evidently selected the site of your operations as a camping-ground. This is awkward. Perhaps they have observed the disturbance at the bottom of the sea, and like marine constables they 'are waiting for the fellow who made it, to run him in.' This is an awkward experience, for these sharks do not clear off and admit your claim. They say all animals have a fear of man; but sharks cannot recognise a man in a diver's costume. They neither oppose nor assist us in our operations; they simply ignore us. We have to be very careful, then, walking round about these lazy pigs without disturbing them. I have occasionally used a small crowbar as a weapon, and struck a small shark on the nose when he was annoying me with his persistency. The shark will then turn and go off with a rush. I would not, however, like to try my crowbar on a shark ten feet long.

After his rush away, he might return for further investigation.

I have had many nasty adventures with sharks when pursuing my occupation; I recollect one that gave me a considerable shock. I had been engaged blowing up a reef of rocks so as to enlarge a little harbour on the coast. It was my duty to make the hole and put in the charge of dynamite. The charge was exploded in the evening after we left off work. On going down every morning I was accustomed to go over to a certain ledge which was always a good resting-place for lobsters. Morning after morning I had invariably found a pair or more of these crustaceans, which I sent to the surface in a basket. On the morning to which I now refer, I walked straight to the ledge and ran my hand carefully along its lower side. I was surprised to find my hand scraping what I took to be the rock; but I was surprised still more when I observed my hand groping within a foot of the mouth of a great shark which had retired to rest in this cavity. The shark must have been as much alarmed as I was, for it made one spring from its resting-place and disappeared in the dark wall of ocean. The shock to me was greater than I could have believed, and even yet I do not care to think about it much. It is hardly necessary to say that I did not return to that ledge for lobsters for some time.

On another occasion, a big fellow came alongside me where I was working. I stopped, of course, and stepped back quietly to let him pass. But he did not. He came nearer. I then thought he was curious, but soon found that another feeling than curiosity was moving him. As I retreated he still advanced, until I found myself jammed up against the rock. I could retreat no farther, and yet the brute came on determinedly. But instead of approaching me with his long nose—for you don't see his jaws—he turned his side and began to rub up against me. I had a small 'jumper' in my hand, which I held with the point outwards against his skin, as I did not wish to have his rough skin scoring along my dress. It was something like what a cow would be rubbing against you. The iron on his skin was, however, the very thing he wanted, as he soon gave me to understand. I was kept there at least half an hour scratching that monster with the sharp iron. He took it like a pig, bending his body and turning over on his side so as to present a fresh surface to the jumper. I suppose he must have felt easier for the operation, for after a time he moved away. I had one or two further visits from him on following days, on each of which I was obliged to scratch him for a time. I think he must have recognised me as a kindly and effectual scratcher. I imagine he was suffering from some parasitical or skin disease, to which he may have fallen a victim. Otherwise, I might be in that scratching billet still.

One of the boys who worked in the boat once inserted a charge of dynamite in a sheep's head; the charge was of course attached to the battery by wire. After we had 'knocked off,' he threw in the sheep's head. In about ten seconds the head was 'taken in' by a small shark. In ten seconds more there was an explosion, and fragments of shark were abundant. In certainly less

than a minute afterwards the sea was almost alive with sharks contending for a relic of their deceased kins-shark. This experience was, however, obtained from the surface, and what I pride myself most on is that I see these creatures from below.

I remember once I had the good fortune to see a battle between a pair of sharks, although at the time I did not by any means think the fortune 'good.' It happened in this way. I was 'down' at the wreck of a ketch off the Illawarra Coast, in New South Wales. The boat was above me, as usual, keeping me supplied with air. I remember I was working with a crowbar, prising asunder the timbers of the broken vessel, which had sunk in such a position that it menaced vessels passing in and out of the harbour. All of a sudden something fell into the water above me. I did not know what it was at the time, but I learned afterwards that it was a waistcoat belonging to one of the men. It is wonderful when you are down in the water how plainly you can see anything above you—I mean in the water. You are covered with light upwards, and anything dark catches the eye. Even a comparatively small fish makes a shadow which will attract attention. I saw the waistcoat almost as soon as it had touched the water. Quick as lightning, three or four sharks converged in towards that waistcoat. I hadn't been thinking of them, and did not believe there was a shark within a mile of me. I was staggered for a second. At one moment there was no sign of them; at the next, the sea seemed to be alive with these hideous creatures, curling and twisting above my head in the clear water. The pocket of the waistcoat contained a big silver watch, and this helped to sink the garment. However, before it had been well wetted, a big fellow of nine or ten feet long turned over and took in the waistcoat and the watch. He then sunk leisurely to the bottom and lay quietly, looking upwards. There was no chewing; waistcoat and watch were alike bolted. Then I thought the adventure was over, and I was about to resume my work. But I was destined to see more. I observed that two of the other and smaller sharks had suddenly engaged in combat. They rolled, they worried, they dodged. Sometimes they were above me in the water; at other times they had descended till on a level with my head. There was no sound that I could hear; there was no disturbance in the water that I could perceive. Encased as I was in my diving dress, I would not have expected either to have heard sounds or felt vibration. Still the contest was terrific. The rolling of the animals in the still water was frightsome. In the conflict they moved farther and farther away from the place where I stood, until they disappeared in the great opaque wall of water which marks the horizon of the diver. As to the rest I can only conjecture. I presume one of them was killed, for I noticed the big fellow who had swallowed the waistcoat, and several other sharks, slide over in the direction which the combatants had taken. They had gone, I hoped, to pay their last respects to one of their friends—perhaps to bury him in their capacious maws.

My friend the diver related many other tales, and imparted to me many curious circumstances

of his life under the sea, to which at some other period I may be permitted to refer. Enough has been said to give us a glimpse of shark-life which it is not permitted for every man to see.

THE DECK HAND.

BY CHARLES KING.

IN TWO CHAPTERS.—CHAPTER I.

It was a feature of Herringbourne that the people always wanted something to lean against. As individuals they leant against walls; as a community they were held up by the Church, the Brewery, and Hurley's Fleet. When the Church had done its 'teas' and the Brewery its malting, the Fleet was a strong supporter.

On a November afternoon, when the branches of the trees on the quay were black and bare, the water in the harbour a mud colour, and the blocks on the rigging of the moored ships stood out like warts against a cold gray sky, Genth Hurley, the Fleet owner, was doing what all owners do—he was paying a smack's crew their poundage. The smack had just come up, and the crew, in duffels, guernseys, and sou'-westers, were scattered about the office. They were a stalwart set of men, with basin-cropped heads and shaved necks. Some had brought their shifting bags ashore, and, with the cheerful ease of men who had not washed for eight weeks, sat on the tops of them. One big fellow, seated thus, nursed on his sea-boots a boy so small and black that he looked as if he had just dropped down a flue. He was the cook.

'Well, skipper,' said Genth, as he put first one and then another little pile of money on his desk, 'what sort of weather have you had?'

'Well, owner,' said the skipper, who was feeling about his head for a chew of tobacco, which he had dabbed at his sou'-wester and lost in his hair. 'I'll speak the truth. It wos b'isterus. A tree reeved sail an' the little jib nearly all the time, an' mount'ins o' sea on the Dogger. Also a most unfortunate sarcumstance: a comin' home, poor Billy Dabbs nearly had his bows stove in with the mainsail bume.'

'I see,' said Genth, 'you are a man short. I'm sorry about poor Billy. Perhaps one of you will take him his poundage? You'll have to ship another man, Holmes.—Here's your money, my lads.'

He laid the last little pile of money on his desk. One by one the crew claimed their own. When all were paid, and the sound of the last pair of sea-boots had died on the pavement, Genth started to put the books right. He was about eight-and-twenty, with dark hair, dark eyes, and a plain earnest face. Before he had finished, the soft illumination of the setting sun had tinted the muddy water that eddied against the bridge. When the red-tiled roofs on the opposite side were a glowing orange he heard a knock. 'Come in!' he cried.

The invitation met no prompt response. There was a fumble with the handle, a fatiguing wiping of feet on the flags, then as if by electricity the door flew open.

'Well?' said Genth. 'What is it?'

'I have come,' said the visitor, 'about a berth—on a smack.'

'It's no use coming to me, my man,' said Hurley. 'You must go to the skippers. I don't ship any one.'

'The skippers,' said the other; 'why, they'd laugh at me. I don't believe they'd have me for ballast. Yet they'd have given something for a nod from me once. I had no need then to come like a beggar to the Fleet—not I. You know that, Hurley.'

For the first time Genth looked up. His pen dropped from his fingers and made a great blot on the neatly ruled page. 'Tom Harrington!' he exclaimed.

'All that is left of him,' said the arrival with a smile, that seemed to court some sort of praise for the remains: 'rather shady, down at the heel, pockets empty, shorn of his splendour, but Tom Harrington still.'

Genth surmised as much. Tom Harrington was the son of a Herringbourne solicitor. The old lawyer had worked hard to save money; his son, to spend it. In three or four years Tom Harrington had spent the accumulations of thirty or forty. Yet he had been more fortunate than Genth Hurley, for he had won from Genth the woman he loved. As Genth looked at Harrington, the change in the latter startled him. There still existed the cut of the man, trimness, jauntiness. His hands were still small and white, his face handsome. But the fire in the shifty blue eyes burnt low; they were encircled by dark hollow rims, and the full red lips were a shade blue and tremulous. He was Genth's age, but looked older. He had lost a lot of health in the shearing process.

'I was told,' said Hurley, 'you were going the pace. But I never thought it was so bad as this. I'm sorry'—

'Don't—don't preach; I get enough of that at home.'

Genth's dark eyes unconsciously hardened. 'How were you brought to this?' he asked.

'Cs and Bs—Cards and Billiards, and, incidentally, Bs and Ss. In my time I have backed many horses. If they'd won I shouldn't have been here. Understand, I'm not the only one—plenty have been broke besides me. In gentlemanly games, too. All of us love sport. It is the backbone of England. I can't see it's my fault; it's the old man's.'

Genth looked at him inquiringly.

'If the old man didn't mean me to live like a gentleman, why did he make a gentleman of me? Why did he send me to a tip-top school, give me first-class ideas, and then die and not leave me enough money to develop these first-class ideas? That puzzles me. Now, if I hadn't been a soft fool; if I had married a woman who had got a bit'—

Genth's eyes grew harder. He picked up his pen and slowly drew a sheet of blotting paper over the ink-blot. 'How is your wife?' he said abruptly.

'Oh, Nell is all right. She takes in a bit of dress-making and millinery. She was always a handy girl with her fingers. But somehow trade has fallen off with her; so I'm forced to do something.—Oh, you needn't look at me like that! I have tried before. I tried once for a place as billiard-marker; but some other fellow got there before me, and I had all the trouble for nothing. But when it comes to your last loaf'—

'My good!'—

'It's time to wake up; so I thought of the Fleet. When there is nothing else doing, every one thinks of the Fleet; and if you have a berth ready for me to jump into, why, I'm your man.' He had suddenly set more than a ballast value on himself. It showed that Harrington was still mercurial.

'Well,' said Genth, 'a vessel came in this afternoon, the *Comet*. One of the men, a deck hand, was injured by the boom. You can go in her, if you like.'

Harrington looked by no means elated. It was evident that one of the last things he expected was to be taken at his word. He had hoped for something better; an easier job, perhaps a loan. 'I'm sure,' he said, 'I don't know whether I'm strong enough. I could try it.'

'You could,' said Genth grimly. 'If you give this note to John Holmes, the skipper of the *Comet*, he'll take you.'

'Thankee,' said Harrington, but by no means gracefully. Then he stood a moment, fidgeted, and coughed.

'Yes,' said Genth, who easily read these tokens, 'I'll advance you a month's pay. Here is half; the rest I'll send to your wife. If she wants more while you are at sea, she shall have it.'

'Why can't I take the lot?' asked Harrington querulously. 'Can't you trust me?'

'I'm afraid not.'

'Good-afternoon,' said the budding smacksman, and he turned on his heel.

'Stop a minute,' said Genth. 'Take the money. I thought you might be tempted.—And now listen, Tom. If you do go, I wish you luck. Make one trip, and directly your foot again touches Herringbourne quay, I will find you something better. Here is my hand on it.'

The angry flush on Harrington's face died away; the shifty look in his eyes vanished, and his form suddenly straightened—for a time only. Then the old expression came back, his shoulders drooped, and muttering something, he shambled out. When he was gone, Genth restlessly paced the office. His successful rival had come to this! He thought of a little house on a hill and a garden overlooking the sea, where old Ned Hall, the retired master of a floating light, had eked out his pension and his life. And sweet Nelly Hall of the laughing blue eyes and chestnut hair! Were those eyes now dim, the cheeks careworn, the fingers?—With a sigh he closed his books, put the key in the office-door, and paler than usual, stepped out upon the pavement.

PROVERBS IN CHAUCER.

Is it not Lord Chesterfield who declares that it is an indication of low breeding for one to cite proverbs or familiar sayings? Nothing could be farther from the truth. Many a proverb, as old perhaps as intelligent mankind, and known alike to Greek and barbarian, Jew and Gentile, contains more wisdom or wit than may be found in the whole series of the over-estimated Chesterfield Letters. There is a directness in proverbs and apothegms which is admirably calculated to carry conviction to the most ordinary mind, while elaborate disquisitions usually fall flat and

are disregarded. In order that they should be readily retained in the memory, they are frequently alliterative or in the form of jingling rhyme, as, for example, in the proverbs, 'Wilful waste makes woful want,' and

'Great cry and little woo','

As the sutor said when he scrapit the soo.

Sometimes they have had their source in fables or popular tales, as in the saying of 'Dog in the manger' and 'Who will bell the cat?' One of the most entertaining features of the ever-fresh romance of *Don Quixote* is honest Sancho's happy use of the proverbs for which his country is pre-eminent. Chaucer, the Father of English poetry—who was certainly a well-bred gentleman—was very partial to proverbs, and employs them very freely in all his writings; and Mr Willibald Haeckel, of Leipzig, has recently published his 'inaugural dissertation' on the proverbs cited by Chaucer, which he wrote as a candidate for the degree of Ph.D. from the university of Erlangen. Mr Haeckel treats the proverbs under thirteen headings, such as, 'Love and Friendship,' 'Fortune and Misfortune,' 'Poverty and Riches'; and his references to corresponding sayings in different countries are fairly representative, though he seems to have confined himself to European gnomologists. He might with great advantage have extended his researches to collections of Asiatic proverbs, such as Gentius's translations of the aphorisms of Sa'di, the illustrious Persian poet and philosopher (thirteenth century); the fourteenth chapter of Sir William Jones's admirable Commentaries on Asiatic Poetry, where the several Persian gnomologists are enumerated and many beautiful sentences are cited; the learned Burckhardt's Arabic proverbs; and a number of other works.

But even well-known European collections of proverbs have been passed over: the *Havarnaal*, ascribed by the *Edda* to Odin; Howell's *Paræmiographia*, the oldest English assemblage, which, however, has been popularly superseded by Ray's Proverbs, first printed in 1672, which is a somewhat fuller though not a very choice collection; Bland's rendering of the *Adagia* of Erasmus (1814), illustrated by examples from the Spanish, Italian, French, and English languages.

Two things will probably surprise any ordinary person who may chance to read this brochure—namely, the number of proverbs current at the present day which were also in vogue in the days of Chaucer, and the identity of the familiar sayings of all European peoples. Thus, our proverb, 'Many men, many minds,' is cited by Chaucer, 'As many hedes, as many wittes been' (*Squire's Tale*); 'A boaster and a liar are cousins-german' is thus expressed in *Troilus*: 'A vauntour and a lyar, al is oone'; 'Every Jack will have his Jill' (or, 'Like draws to like');

Ne noon so gray a goos goth in the lake,

As sayest thou wol be withouten a make [mate].

Prol. to Wife of Bath's Tale.

Not infrequently our poet cites the same proverb in different poems, as in the case of 'The more haste, the less speed,' which is thus variously expressed:

The proverb saith, in wikked haste is no profyt.

Tale of Melibæus.

Wikked haste doth no profyt.—*Parson's Tale.*

Hastif man ne wanteth nevere care.—*Troilus.*

Mr Haeckel strangely omits the Latin proverb, 'Festina lente,' in connection with 'He hastith wele that wisly can abyde' (*Mel.*), which reappears in *Troilus*. Our familiar saw that 'There are as good fish in the sea as ever came out of it' was in Chaucer's time, 'There ben moo [more] sterres, God wot, than a paire' (*Parl. of Foules*); while 'Every man knows best where his own shoe pinches' is in the *Merchant's Tale*, 'I woot best wher wryngeth me my scho.' The Latin proverb, 'Bis dat qui cito dat,' is in *Prol. to Legend*:

Whoso yeveth a yifte, or dooth a grace,

Do it bytime, his thank ys wel the more.

One of Chaucer's finest passages, the first line of which Mr Haeckel cites as a proverb, with little justification,

Love wil not ben constreyned by maystrie;

Whan maystrie commith, the god of love anon

Beteth his winges, and farewel, he is gone—

Franklin's Tale,

has been boldly stolen—'convey, the wise it call'—by no less a poet than Edmund Spenser (*Faerie Queene*):

Ne may love ben compeld by maistry;

For soone as maistry comes, sweet Love anon

Taketh his nimble winges, and farewel, away is gone.

Following either Spenser or Chaucer, the witty author of *Hudibras* has thus amplified the thought:

Love, that's too generous t' abide

To be against its nature tied;

For where 'tis of itself inclined

It breaks out when it is confined,

And, like the soul, its harbourer,

Debarred the freedom of the air,

Disdains against its will to stay,

But struggles out and flies away.

The plagiarisms of Pope are by no means few; but he was generally careful to lay obsolete or obscure poets under contribution. This is how he has filched from Chaucer:

Love, free as air, at sight of human ties,

Spreads his light wings and in a moment flies.

The proverb, or truism, that 'Fortune is changeable' (*Knight's Tale*) Mr Haeckel parallels from Hazlitt's collection: 'Fortune is variant, ever turning her wheel;' and 'Women, wind, and fortune are ever changing,' from Le Roux, Kadler, and many other gnomologists. The unfortunate King James I. of Scotland has a fine passage on the mutability of Fortune in his *King's Quair* (or Book):

For sothe it is, that, on her tolter quhele,

Every wight cleverith in his stage,

And failyng foting oft quhen her lest lele,

Sum up, sum down, is non estate nor age

Ensured more the Prynce than the page;

So uncouthly her wurdres [destinies] she divideth,

Namely in youth, that seildun ought provideth.

In the old play of *The Triumph of Honour* we read that

She but jests with man as in mischance,

Abhors all courtesy, flouting him still

With some small touch of good, or seeming good,

Midst of his mischief; which vicissitude

Makes him straight doff his armour and his fence

He had prepared before to break her strokes.

And Defoe, in a scathing letter to Lord Haversham: 'Fate makes footballs of men; kicks some up-stairs and some down; some are advanced without honour, others suppressed without

infamy; some are raised without merit, some crushed without crime; and no man knows by the beginning of things whether his course shall issue in a peerage or a pillory.'

The anonymous author of the oldest extant Hindu drama, *Mrichichati*, anticipated Defoe by more than two thousand years:

Fate views the world

A scene of mutual and perpetual struggle,
And sports with life as if it were a wheel
That draws the limpid water from the well.
For some are raised to affluence, some depressed
In want, and some are borne awhile aloft,
And some hurled down to wretchedness and woe.

Again: 'O Fate! thou sportest with the fortunes of mankind like drops of water trembling on the lotus leaf.'

The twenty-first proverb cited by Mr Haeckel, from *Troilus*—

It is seyde men maketh oft a yerd [a staff]
With which the maker is hymself ybeten—

may be compared with 'He who diggeth a pit for another may fall into it himself;' while Nos. 22 and 22a, 'Joy aftir woo, and woo aftir gladnesse' (*Knight's Tale*), and 'Aftir woo, I rede us to be mery' (*Ibid.*), have parallels in most countries, and recall the comforting scriptural passage (Ps. xxx. 5), 'Weeping may endure for a night, but joy cometh in the morning.'

In the section on Poverty and Riches we have this saw (*Man of Law's Tale*):

If thou be pore, thy brother hateth thee,
And alle thy frendes fleeth fro thee.

So, too, saith the Persian proverb, 'A man without money is fatherless;' and again, 'The sun never shines auspiciously on the man without money.' And with reference to the quest of riches, we have the saying, so characteristic of Chaucer's time, when falconry was the all-engrossing pastime: 'With empty hond men may noon hawkes lure' (*Prol. Wife of Bath's Tale*), which is exactly paralleled in Erasmus's *Praise of Folly*: 'Vacuis manibus non facile falcones revocantur.' The Spaniards have the analogous proverb, 'He that would gain the wealth of the Indies must take with him the wealth of the Indies.' And Samuel Rowley, in his quaint tract, *The Search for Money* (1609), says: 'Think ye to catch fish with an unbaited hook, or take a whale with a purse-net? Then may ye return with a bare hook and an empty purse.'

Our poet often cites the proverbs ascribed to the sage Hebrew king, as in the *Tale of Melibeus*: 'Solomon saith, that al thinges obeyen to money;' which has its very echo in Shakespeare: 'If money go before, all ways do lie open;' and L'Estrange says: 'Money does all things; for it gives and it takes away, it makes honest men and knaves, fools and philosophers, and so forward, *mutatis mutandis*, to the end of the chapter.' A Persian writer, Nakhshabi (c. 1326), calls money 'the traveller who understands all languages.' And Aristophanes divertingly hits off the interested respect paid to the possessors of wealth:

Why, what a plague friends are on these occasions!
One hatches them in swarms when one gets money.
They nudge my sides and pat me on the back,
And smother me with tokens of affection;
Men bow to me I never saw before,

And all the pompous dawdlers in the square
Find me the very centre of attraction.

The apostle Paul's dictum that 'the love of money is the root of all evil' is cited by Chaucer in the Prologue to the *Pardoner's Tale*, in *Melibeus*, and in the *Parson's Tale*. Sa'di says: 'Covetousness sews up the eyes of cunning, and brings both bird and fish into the net.' The well-worn saw, that 'The fool's bolt is soon shot,' thus finds expression in the *Romance of the Rose*:

Every wise man, out of drede,
Can kepe his tunge til he se nede;
And fooles can not holde her [their] tunge;
A fooles belle is soone runge.

Another proverb cited by our poet, 'A fool may ek a wyse man oftē gyde' (*Troilus*), recalls the lines in the fine old ballad of King John and the Abbot of Canterbury:

Now cheer up, Sir Abbot; did you never hear yet
That a fool he may learn a wise man wit?

And there is a corresponding saw, 'A knave may help an honest man.'

We have seen that undue haste is condemned by the proverbial lore of most countries; but it does not appear that Chaucer employs any saying directly in favour of patience, a virtue which Oriental sages are never weary of recommending. The Persians have a pretty proverb, 'Patience is bitter, but it bears sweet fruit;' and the Turks, 'Mid bitter sorrows patience show, for 'tis the key of gladness.' Our poet makes use of the saw, 'To make a virtue of necessity,' in the *Knight's Tale*, the *Squire's Tale*, and *Troilus*. It is also used by Rabelais, Shakespeare (*Two Gentlemen of Verona*), and Dryden (*Palamon and Arcite*).

The virtue of contentment has been a favourite theme of philosophers in all ages. Chaucer has (*Romance of the Rose*):

Suffisaunce alle oonly
Makith man to lyve richely,

which has its parallels in Le Roux: 'Car suffisance fait richesse, et convoitise fait povresse,' and 'Contentement passe richesse.' Selman, a Persian sage, says: 'I asked an experienced elder who had profited by his knowledge of the world, "What course should I pursue to obtain prosperity?" He replied: "Contentment—if you are able, practise contentment."'

THE TOUCH OF PAIN.

SPRING laughs for gladness of her buds upcured,
Her myriad songs and hues and odours rare,
And, faint for utter bliss, Summer's noon air
Lies hushed; the loud winds in their dances whirled
Shout Autumn's glee, until the force far-hurled
Of Winter's keen delight over the bare
And bending forests flies; all seasons share
The joy that wells from out the heart o' the world.

So dream young souls, unsmitten of sharp years,
Till in the way uprises One, and lays
The magic of his touch on eyes and ears,
And Spring laments, and Summer swoons to dying,
And wailing Autumn leads where Winter frays
The heaven and shakes the earth with frenzied
crying.

ON SILENCE.

MUCH has been written and said of the advantages of golden Silence over silver speech; and people break silence continually to recommend that it should remain unbroken, which is as though one should demonstrate the advantages of darkness by showing a light. In fact, silence has so many sides to it—it is now admirable, now detestable, now useful, and now criminal—sometimes awful, and sometimes ridiculous—that we dare not commend it unconditionally. At any rate, we are not struck dumb with admiration of it. The eloquent silence of innocence suffering under unmerited reproach and persecution is indeed beautiful. Admirable is the modest silence of youth listening to the teachings of wise old age; and silence is the fullest answer to questions that are either impertinent or unanswerable.

The stillness—as of a silence that may be felt—of a starlit sky on a frosty night, or of a pine-bordered lake at sunset, when ‘not a breath creeps through the rosy air’—such a silence, if not in itself beautiful, at least enhances in a high degree the loveliness existent in the scene; just as the power and sweetness of music—such as the song of a nightingale, for instance—are heightened by the silent darkness of a summer night. Yet the same silence brooding over a desert is gloomy and dismal; and if there be cause to fear an enemy shrouded in the silence, it becomes more than desolate—terrifying.

Silence is nearly always useful when work is going on; it is a great fellow-worker: bees buzz in their hives, but are silent in the bosoms of flowers, where their harvest is richest. How solemn is the silence, when the last bell ceases on a Sunday morning, to the listening shepherd far away on the hill-side! How peaceful the silence when Friends sit in silent meditation, and no one is moved to utter even good words, and all are communing with their own hearts and are still. How treacherous is silence when we allow a neighbour to approach, unwarned, a

danger perceptible to us but not to him. How shameful is it when we keep it unbroken, listening to his calumniators when they bring forward an accusation we know to be groundless!

Although we have said silence is useful to the worker, as every check takes something from his power either of concentrated attention or execution, still it must be owned that errors in thought and workmanship are sometimes avoided by work being talked about. Most wild doctrines have been hatched in silence and solitude: had they been discussed, they would probably have never been brought before the world. And although silent thought should precede words and actions—for without it they are as leaves and blossoms without root—still it is not good to be all root, and allow no one but ourselves to profit by our meditations. It is not merely that silence bestows no wisdom on its fellows; it has not perhaps any superfluity to dispense; but a silence that is occupied with preserving itself, its own ease, safety, and dignity—granting that it does all this—must yet always want the sacred splendour of beneficence. For though we may have no wisdom to bestow, we have all of us at least kindness and courtesy at our command. Half the world does not know their own strength, their power to give good cheer and sympathy, simply because they have never tried it. And yet the next best way of breaking silence—after praising our Maker—is by comforting our neighbour, not as Job’s neighbours comforted him, however, by exhortations, ‘lengthened, sage advices,’ following on a seven days’ silence.

And if silence occasionally confirms us in errors of thought and workmanship, how dangerous are some of its immediate children; for it breeds misconception, misunderstanding, jealousy, distrust, envy. How many hearts have ached in a silence, which, broken by a few kind, hearty, generous words, would have glowed with happiness and gratitude; how many lives have been clouded by the proud or cowardly silence which, dispelled by a candid acknowledgment of mistake or misconduct, would have left them bright and

contented. Of all the penalties the solitary mind pays for its silence, sure the deepest and bitterest, the most lasting, because most unavailing, is the too late conviction that silence has been preserved at the expense of justice, at the cost of happiness to others or to ourselves. Mischievous as are sour and unkind words, appallingly tedious as are trite and inept observations 'leading nowhere,' we doubt if they are so mischievous or so tedious as a stony or contemptuous or mocking silence. If the tongue is a fire which has kindled war and misery time out of mind, it is also a generous flame that has lighted a living spark of fiery courage, lofty self-denial, unswerving devotion in the souls of the whole human race!

A philosophical writer has observed that men often treat their dogs with greater kindness than their womankind; and supposes they do so because the former do not bore their masters with advice, reproach, or expostulations, as the latter too frequently do. It may be so; yet we cannot help thinking this reflects on the judgment of the selector of the said womankind, who has, unfortunately for himself, chosen one not wise enough to be aware that discretion in speech is worth more than eloquence.

Some minds run in such grooves—unhappily for their friends, not silent ones—that no sooner is a subject introduced than the whole home circle knows what to expect. The inevitable anecdote, the unfailing reflection, the threadbare morality, are dragged in by the head and shoulders, like Mrs Wickham's sister's Betsey-Jane, quenching all talk save its own bald disjointed chat, and leaving the listeners sighing for a golden silence; for, observe, it is always other people's silence that is sighed for. It is a truism that many folks gain and maintain a reputation for wisdom by saying and doing little or nothing with overpowering solemnity. They call themselves 'serious-minded;' in their presence, quips and cranks die away like flowers in frost; they cannot distinguish between bitterness and salt, and so are continually taking offence where none was meant. A joke, to them, unless it is thoroughly time-honoured, is execrating; it has not got the stamp of authority; it is not current coin; they will none of it; and a pun is worthy of penal punishment. Silence is their Moloch, to which their children, friends, and servants are daily sacrificed. By remaining silent sometimes about what they know, they are enabled to take credit for a great deal of which they are ignorant. If they by chance get hold of an idea, they treat it as careless or wicked nurses do their bantling charges—smother it in silence. They account all suspicions true, yet bridle them as false, and feed on them, rather than question of them with those who could and would dispel their dismal doubts. Every question has its two sides, yet they are content silently to know their own only. That Plato's dialogues were cast in that form in order the better to sift their subject, teaches them nothing. They will never so winnow their notions. Try to get at their opinions, and straightway, with a pride that apes humility, they will take refuge in the vaunted poverty of their endowments. They are not clever, they say, with an air and emphasis which clearly proclaims that they could be if they chose, but they hope they know better.

Contrasted with this self-imposed and affected silence, how tranquil is the soothing stillness of a library! Here our friends upon the shelves, upon whom we have turned our backs this many a day, are always ready to return good for evil—benefits for neglect; to give counsel, wisdom, amusement, and delight for contemptuous disregard. To such a well-peopled solitude, such eloquent silence, it is good now and again to repair, remembering that this temporary withdrawal from our fellows will one day be continual.

How dreadful is silence when it is the sole answer to a cry for help, a prayer for forgiveness, a petition for love! Silence, temporary silence, full of breath-holding expectancy, as when a storm is gathering and the 'whole orb lies hushed,' a pin-dropping silence when a great orator, or preacher, or actor, pauses to emphasise his point: the strained silence that succeeds to a cry of agony; and that last, deepest silence when the labouring breast heaves no more!

Noise is said ere now to have killed men—notably the artist John Leech, by the insidious undermining of the power of endurance; and we have recently known a case where the hearing having been restored by an operation, after a seven years' silence, the nerves had become so acutely sensitive that any ordinary noise, such as the sudden closing of a door or passing by of a carriage, threw the patient into an ecstasy of tremulous agitation which threatened to end in downright insanity. We all know by experience how disagreeable is the shock or jar producing an involuntary start and quickening of the heart's action, which a sudden and unexpected explosion of sound will cause to the strongest nerved; but very few, fortunately, have to endure that far worse tension of the nerves, when only the striking of the heart against the ribs, the rush of blood through the head, fill up the long hours, days, and weeks of those whose insubordination has brought upon them that most ghastly form of human misery, solitary confinement.

Such is the dreadful power of continuous silence, that hardly any sound, however disagreeable in itself, but would be hailed with rapture, in place of the aching void, the huge, superincumbent, intolerable burden of a silence that is absolute.

BLOOD ROYAL.

CHAPTER II.—THE HEAD OF THE HOUSE.

MR EDMUND PLANTAGENET'S residence in Chiddingwick High Street was less amply commodious, he often complained in the bosom of the family, than his ancestral home at Windsor Castle. But as Mr Plantagenet himself had never inhabited the home of his forefathers, he felt the loss of his hereditary domains less keenly than might perhaps have been expected from so sensitive a person. Still, the cottage at Chiddingwick, judged even by the less exalted standard of Mr Plantagenet's own early recollections, was by no means unduly luxurious. For Edmund Plantagenet had been well brought up, and received in his day the education of a gentleman.

It was a sad history, and alas! a very common one. Thirty years before, when Edmund Plantagenet, not yet a believer in his own real or pretended royal descent, went up to London from Yorkshire to seek his fortune in literature, he was one of the handsomest and most popular young men in his own society. His name alone succeeded in attracting attention; we are not all of us Plantagenets. The admirable Lady Postlethwaite, arbiter in her day of literary reputation, gave the man with the royal surname the run of her well-known *salon*; editors accepted readily enough his inflated prose and his affected poetry; and all the world went well with him for a time—while he remained a bachelor. But one fine day Edmund Plantagenet took it into his head, like many better men, to fall in love—we have done it ourselves, and we know how catching it is—and not only to fall in love, but also, which is worse, to give effect to his feelings by actually getting married. In after-life, Mr Plantagenet regarded that unfortunate step as the one fatal error in an otherwise blameless career. He felt that with a name and prospects like his he ought at least to have married rank, title, or money. Instead of which, he just threw himself away: he married only beauty, common-sense, and goodness. The first of these fades, the second palls, and the third Mr Plantagenet was never constructed to appreciate. But rank and money appeal to all, and persist unchanged after such skin-deep attractions as intellect or good looks have ceased to interest.

From the day of his marriage, then, Edmund Plantagenet's downward career began. As a married man, he became at once of less importance in Lady Postlethwaite's society—he was so useful for dances. Editors found out by degrees that he had only affectation and audacity in place of genius; work fell short as children increased; and evil days began to close in upon the growing family. But what was worst of all, as money grew scarcer, a larger and larger proportion of it went each day to swell the receipts, at first of his club, and afterwards, when clubs became things of the past, of his nearest public-house. To make a long story short, before many years were over, Edmund Plantagenet, the young, the handsome, the promising, had degenerated from a dashing and well-bred fellow into a miserable sot of the sorriest description.

But Mr Plantagenet's present ostensible means of gaining an honest livelihood was by no means a regal one. He kept, as he was wont to phrase it gently himself, a temple of Terpsichore. In other words, he taught the local dancing-class. In his best days in London, when fortune still smiled upon him, he had been famed as the most graceful waltzer in Lady Postlethwaite's set; and now that the jade had deserted him to his lowest depth, he had finally settled down as the Chiddingwick dancing-master. Sot as he was, all Chiddingwick supported him loyally, for his name's sake: even Lady Agatha's children attended his lessons. It was a poor sort of trade, indeed, for the last of the Plantagenets; but he consoled himself under the disgrace with the cheerful reflection that he served, after all, as it were, as his own Lord Chamberlain.

On this particular night, however, of all the year, Mr Plantagenet felt more profoundly out

of humour with the world in general and his own ancestral realm of England in particular, than was at all usual with him. The fact was, his potential subjects had been treating him with marked want of consideration for his real position. Kings in exile are exposed to intolerable affronts. The landlord of the *White Horse* had hinted at the desirability of paying arrears on the score of past brandies and sodas innumerable. The landlord was friendly, and proud of his guest, who 'kept the house together;' but at times he broke out in little fits of petulance. Now Mr Plantagenet, as it happened, had not the wherewithal to settle this little account off-hand, and he took it ill of Barnes, who, as he justly remarked, 'had had so much out of him,' that he should endeavour to hurry a gentleman of birth in the matter of payment. He sat by his own fireside, therefore, in no very amiable humour, and watched the Mother bustling about the room with her domestic preparations for the family supper.

'Clarence,' Mr Plantagenet said, after a moment of silence, to one of the younger boys, 'have you prepared your Thucydides? It's getting very late. You seem to me to be loafing about doing nothing.'

'Oh, I know it pretty well,' Clarence answered with a nonchalant air, still whittling at a bit of stick he was engaged in transforming into a home-made whistle. 'I looked it over in class. It's not very hard. Thucydides is rot—most awful rot. It won't take five minutes.'

Mr Plantagenet, with plump fingers, rolled himself another cigarette. He had come down in the world, and left cigars far behind, a fragrant memory of the distant past; but as a gentleman he could never descend to the level of a common clay pipe. 'Very well,' he said blandly, leaning back in his chair and beaming upon Clarence: a peculiar blandness of tone and manner formed Mr Plantagenet's keynote. 'That may do for me, perhaps—but it won't do for Richard.' After which frank admission of his own utter abdication of parental prerogatives in favour of his own son, he proceeded very deliberately to light his cigarette, and stare with placid eyes at the dilatory Clarence.

There was a minute's pause; then Mr Plantagenet began again. 'Eleanor,' he remarked in the same soft self-indulgent voice to his youngest daughter, 'you don't seem to be doing anything. I'm sure you've got some lessons to prepare for to-morrow.' Not that Mr Plantagenet was in the least concerned for the progress of his children's education; but the deeper they were engaged with their books, the less noise did they make with their ceaseless chatter in the one family sitting-room, and the more did they leave their fond father in peace to his own reflections.

'Oh, there's plenty of time,' Eleanor answered with a little toss of her pretty head. 'I can do 'em by-and-by—after Dick comes in. He'll soon be coming.'

It was part and parcel of Mr Plantagenet's silent method of claiming royal descent that he called all his children with studious care after the earlier Plantagenets, his real or supposed ancestors, who were kings of England. Thus his first-born was Richard, in memory of their distinguished predecessor, the mighty Cœur-de-Lion: his next was Lionel Clarence, after the

second son of Edward IV., the particular Prince upon whom Mr Plantagenet chose to affiliate his family pedigree: and his third was Henry, that being the Plantagenet name which sat first and oftenest upon the throne of England. His eldest girl, in like manner, was christened Maud, after the foundress of his house who married Geoffrey Plantagenet, and so introduced the blood of the Conqueror into the Angevin race: his youngest was Eleanor, after the wife of Henry II., 'who brought us Poitou and Aquitaine as heirlooms.' Mr Plantagenet, indeed, never overtly mentioned these interesting little points in public himself; but they oozed out for all that by lateral leakage—and redounded thereby much the more to their contriver's credit. His very reticence told not a little in his favour. For a dancing-master to claim by word or deed that he is *de jure* king of England would be to lay himself open to unsparing ridicule; but to let it be felt or inferred that he is so, without ever for one moment arrogating to himself the faintest claim to the dignity, is to pose in silence as an injured innocent, a person of most distinguished and exalted origin, with just that little suspicion of pathos and mystery about his unspoken right which makes the thing really dignified and interesting.

Hardly, however, had Mr Plantagenet uttered those memorable words, 'Dick's late to-night; I wonder what keeps him,' when the front door opened, and the Heir Apparent entered.

Immediately some strange change seemed to pass by magic over the assembled household. Everybody looked up, as though an Event had occurred. Mrs Plantagenet herself, a weary-looking woman with gentle goodness beaming out of every line in her worn face, gave a sigh of relief. 'Oh, Dick,' she cried, 'I'm so glad you've come. We've all been waiting for you.'

Richard glanced round the room with a slight air of satisfaction. It was always a pleasure to him to find his father at home, and not, as was his wont, in the *White Horse* parlour; though, to say the truth, the only reason for Mr Plantagenet's absence that night from his accustomed haunt was this little tiff with the landlord over his vulgar hints of payment. Then he stooped down and kissed his mother tenderly on the forehead; patted Eleanor's curly head with a brotherly caress; gave a kindly glance at Prince Hal, as he loved to call him mentally; and sat down in the easy-chair his mother pushed towards him.

For a moment there was silence; then Dick began in an explanatory voice: 'I'm sorry I'm so late; but I had a piece of work to finish to-night, mother: rather particular work, too; a little bit of book-binding.'

'You get paid extra for that, Richard, don't you?' his father asked, growing interested.

'Well, yes,' Dick answered, rather grudgingly; 'I get paid extra for that; I do it in overtime. But that wasn't all,' he went on hurriedly, well aware that his father was debating in his own mind whether he couldn't on the strength of it borrow a shilling. 'It was a special piece of work for the new governess at the rectory. And mother, isn't it odd? her name's Mary Tudor!'

'There isn't much in that,' his father answered,

balancing his cigarette daintily between his first and second finger. "'A' Stuarts are na sib to the king," you know, Richard. The Plantagenets who left the money had nothing to do with the royal family—that is to say with *us*,' Mr Plantagenet went on, catching himself up by an after-thought. 'They were mere Sheffield cutlers, people of no antecedents, who happened to take our name upon themselves by a pure flight of fancy, because they thought it high-sounding. Which it is, undoubtedly. And as for Tudors, bless your heart, they're common enough in Wales. In point of fact—though I'm proud of Elizabeth, as a by-blow of the family—we must always bear in mind that for *us*, my dear boy, the Tudors were never anything but a distinct *mésalliance*.'

'Of course,' Richard answered with profound conviction.

His father glanced at him sharply. To Mr Plantagenet himself this shadowy claim to royal descent was a pretty toy to be employed for the mystification of strangers and the aggrandisement of the family—a lever to work on Lady Agatha's feelings; but to his eldest son it was an article of faith, a matter of the most cherished and the profoundest belief, a reason for behaving one's self in every position in life so as not to bring disgrace on so distinguished an ancestry.

A moment's silence intervened; then Dick turned round with his grave smile to Clarence: 'And how does Thucydides get on?' he asked with brotherly solicitude.

Clarence wriggled a little uneasily on his wooden chair. 'Well, it's not a hard bit,' he answered, with a shamefaced air. 'I thought I could do it in a jiffy after you came home, Dick. It won't take two minutes.' It's just that piece, don't you know, about the revolt in *Corcyra*.'

Dick looked down at him reproachfully. 'Oh, Clarry,' he cried with a pained face, 'you know you can't have looked at it. Not a hard bit, indeed! why, it's one of the obscurest and most debated passages in all Thucydides!—Now, what's the use of my getting you a nomination, old man, and coaching you so hard, and helping to pay your way at the grammar-school, in hopes of your getting an Exhibition in time, if you won't work for yourself, and lift yourself on to a better position?' And he glanced at the wooden mantel-piece, on whose vacant scroll he had carved deep with his penknife his own motto in life, *Noblesse oblige*, in Lombardic letters, for his brother's benefit.

He spoke with a seriousness that was above his years. To say the truth, Mr Plantagenet's habits had almost reversed their relative places in the family. Dick was naturally conscientious, having fortunately inherited his moral characteristics rather from his mother's side than from his father's; and being thrown early into the position of assistant bread-winner and chief adviser to the family, he had grown grave before his time, and felt the weight of domestic cares already heavy upon his shoulders. As for Clarence, who had answered his father with scant respect, he never thought for a moment of disobeying the wishes of his elder brother. He took up the dog-eared Thucydides that had served them both in turn, and the old Liddell and Scott that was

still common property, and began conning over the chapter set before him with conspicuous diligence. Dick looked on meanwhile with no little satisfaction, while Eleanor went on with her work, in her chair in the corner, vaguely conscious all the time of meriting his approbation.

At last, just as they sat down to their frugal supper of bread and cheese and water—for by Dick's desire, they were all, save one, teetotalers—Dick sprang a mine upon the assembled company by saying out all at once in a most matter-of-fact voice to his neighbour Clarry: 'No, I shan't be able to help you very much in future, I'm afraid—because, next week, I'm going up to Oxford—to try for a Scholarship.'

A profound spell of awed silence followed this abrupt disclosure of a long-formed plan. Mr Plantagenet himself was the first to break it. He rose to the occasion. 'Well, I'm glad at least, my son,' he said, in his most grandiose manner, 'you propose to give yourself the education of a gentleman.'

'And therefore,' Dick continued, with a side-glance at Clarence, 'I shall need all my spare time for my own preparation.'

CHAPTER III.—DISCOUNTING IT.

Mrs Plantagenet looked across the table at her son with vague eyes of misgiving. 'This is all very sudden, Dick,' she faltered out, not without some slight tremor.

'Sudden for you, dear mother,' Dick answered, taking her hand in his own; 'but not for me. Very much otherwise. I've had it in my mind for a great many months; and *this* is what decided me.'

He drew from his pocket as he spoke a small scrap of newspaper and handed it across to her. It was a cutting from the *Times*. Mrs Plantagenet read it through with swimming eyes. 'University Intelligence: Oxford.—Four foundation Scholarships will be awarded after public examination at Durham College on May 20th. Two will be of the annual value of One Hundred Pounds, for Classics; one of the same value for Natural Science; and one for Modern History. Application to be made, on or before Wednesday the 19th, to the Rev. the Dean at Durham College, who will also supply all needful information to intending candidates.'

The words swam in a mist before Mrs Plantagenet's eyes. 'What does it all mean, dear Dick?' she inquired almost tearfully.

'It means, mother,' Dick answered with the gentlest tenderness, 'that Durham is the only college in the university which gives as good a Scholarship as a hundred a year for modern history. Now, ever since I left the grammar-school, I haven't had it out of my mind for a day to go, if I could, to Oxford. I think it's incumbent upon a man in my position to give himself, if possible, a university training.'

He said the words without the slightest air of conceit or swagger, but with a profound consciousness of their import; for to Richard Plantagenet the myth or legend of the ancient greatness of his family was a spur urging him ever on to make himself worthy of so glorious an ancestry. 'So I've been working and saving ever since,' he went

on, 'with that idea constantly before me; and I've looked out for twelve months or more in the *Times* every day for the announcement of an exam. for the Durham Scholarship.'

'But you won't get it, my boy,' Mr Plantagenet put in philosophically after a moment's consideration. 'You never can get it.—Your early disadvantages, you know—your inadequate schooling—so many young fellows well coached from Eton and Harrow!'

'If it had been a classical one, I should agree with you: I couldn't, I'm afraid,' Richard responded frankly, for he was by no means given to over-estimate his own abilities; 'but in history it's different. You see, so much of it's just our own family pedigree and detail of our ancestry. That acted as a fillip—gave me an interest in the subject from the very first; and as soon as I determined to begin reading for Oxford, I felt at once my best chance would lie in modern history. And that's why I've been working away at it as hard as ever I could in all my spare time for more than a twelvemonth.'

'But have you been reading the right books, Dick?—that's the question,' his father put in dubiously, with a critical air, making a manful effort to recall the names of the works that were most authoritative in the subject when he himself last looked at a history: 'Sharon Turner, Kemble, Palgrave, Thierry, Guizot, and so forth?'

Richard had too deep a respect for the chief of the Plantagenets, miserable sot though he was, to be betrayed into a smile by this belated catalogue. He only answered with perfect gravity: 'I'm afraid none of those would be of much use to me nowadays in a Scholarship exam.: another generation has arisen which knows not Joseph. But I've got up all the books recommended in the circular of the Board of Studies—Freeman, you know, and Stubbs, and Green, and Froude, and Gardner. And I've worked especially at the reigns of the earlier Plantagenets, and the development of the towns and guilds and all that sort of thing, in Brentano and Seeböhm.'

'Jones tertius has a brother at Oxford,' Clarence put in very eagerly: 'and he's a howling swell; he lives in a room that's panelled with oak from top to bottom.'

'And if you get the Scholarship, Dick,' his mother went on wistfully, 'will you have to go and live there, and be away from us always?'

'Only half the year, mother dear,' Richard answered coaxingly; for he knew what she was thinking—how hard it would be for her to be left alone in Chiddingwick, among all those unruly children and her drunken husband, without the aid of her one help and mainstay. 'You know, there's only about five months of term, and all the rest's vacation. In vacation, I'd come home, and do something to earn money towards making up the deficit.'

'It's a very long time, though, five months,' Mrs Plantagenet said pensively. 'But, there!' she added after a pause, brightening up—'perhaps you won't get it.'

Grave as he usually was, Richard couldn't help bursting into a merry laugh at this queer little bit of topsy-turvy self-comfort. 'Oh, I hope to goodness I shall,' he cried with a twinkle, 'in spite of that, mother. It won't be five months all in a lump, you know; I shall go up

for some six or eight weeks at a time—never more than eight together, I believe—and then come down again. But you really needn't take it to heart just yet, for we're counting our chickens before they're hatched, after all. I mayn't get it, as you say; and indeed, as father said just now, when one comes to think how many fellows will be in for it who have been thoroughly coached and crammed at the great public schools, my chance can't be worth much—though I mean to try it.'

Just at that moment, as Dick leaned back and looked round, the door opened, and Maud, the eldest sister, entered.

She had come home from her singing lesson; for Maud was musical, and went out as daily governess to the local tradesmen's families. She was the member of the household who most of all shared Dick's confidence. As she entered, Harry looked up at her, full of conscious importance and a mouthful of Dutch cheese. 'Have you heard the news, Maudie?' he asked all breathless. 'Isn't it just ripping? Dick's going up to Oxford.'

Maud was pale and tired from a long day's work—the thankless work of teaching; but her weary face flushed red none the less at this exciting announcement, though she darted a warning look under her hat towards Richard, as much as to say: 'How could you ever have told him?'

But all she said openly was: 'Then the advertisement's come of the Durham Scholarship?'

'Yes, the advertisement's come,' Dick answered, flushing in turn. 'I got it this morning, and I'm to go up on Wednesday.'

The boys were rather disappointed at this tame announcement. It was clear Maud knew all about the great scheme already. And indeed, she and Dick had talked it over by themselves many an evening on the hills, and debated the pros and cons of that important new departure. Maud's face grew paler again after a minute, and she murmured half regretfully, as she unfastened her hat: 'I shall miss you if you get it, Dick. It'll be hard to do without you.'

'But it's the right thing for me to do,' Richard put in almost anxiously.

Maud spoke without the faintest hesitation in her voice. 'Oh yes, it's the right thing,' she answered. 'Not a doubt in the world about that. It's a duty you owe to yourself, and to us—and to England. Only, of course, we shall all feel your absence a very great deal. Dick, Dick, you're so much to us! And I don't know,' she went on, as she glanced at the little ones with an uncertain air—'I don't know that I'd have mentioned it before babes and sucklings—well, till I was sure I'd got it.'

She said it with an awkward flush; for Dick caught her eye as she spoke and read her inner meaning. She wondered he had blurted it out prematurely before her father. And Dick, too, saw his mistake. Mr Plantagenet, big with such important news, would spread it abroad among his cronies in the *White Horse* parlour before to-morrow was over!

Richard turned to the children. 'Now, look here, boys,' he said gravely: 'this is a private affair, and we've talked it over here without reserve in the bosom of the family. But we've talked it over in confidence: it mustn't be re-

peated. If I were to go up and try for this Scholarship, and then not get it, all Chiddingwick would laugh at me for a fellow that didn't know his proper place, and had to be taught to know it. For the honour of the family, boys—and you too, Nellie—I hope you won't whisper a word of all this to anybody in town. Consider what a disgrace it would be if I came back unsuccessful, and everybody in the parish came up and commiserated me: "We're so sorry, Mr Dick, you failed at Oxford. But there, you see, you had such great disadvantages!"'

His handsome face burned bright red at the bare thought of such a disgrace; and the little ones, who after all were Plantagenets at heart as much as himself, every one of them, made answer with one accord: 'We won't say a word about it.' They promised it so earnestly, and with such perfect assurance, that Dick felt he could trust them. His eye caught Maud's. The same thought passed instinctively through both their minds. What a painful idea that the one person they couldn't beg for very shame to hold his tongue was the member of the family most likely to blab it out to the first chance comer!

Maud sat down and ate her supper. She was a pretty girl, very slender and delicate, with a fair pink-and-white skin, and curious flashing eyes, most unusual in a blonde, though she was perhaps just a shade less handsome and distinguished-looking than the Heir Apparent. All through the meal, little else was talked of than this projected revolution, Dick's great undertaking. The boys were most full of it—our Dick at Oxford! It was ripping, simply ripping! A lark of the first dimensions! Clarence made up his mind at once to go up and see Dick, his very first term, in oak-panelled rooms at Durham College; they *must* be oak-panelled: while Harry, who had feasted on *Verdant Green* for weeks, was anxious to know what sort of gown he'd have to wear, and whether he thought he'd have ample opportunities for fighting the proctors. 'Twas a foregone conclusion. So innocently did they all discount 'Our Dick's' success, and so firmly did they believe that whatever he attempted he was certain to succeed in!

After supper, Mr Plantagenet rose with an important air and unhooked his hat very deliberately from its peg. His wife and Dick and Maud all cried out with one voice: 'Why, surely, you're not going out to-night, father!'

For to go out, they knew well, in Mr Plantagenet's dialect, meant to spend the evening in the *White Horse* parlour.

'Yes, my dear,' Mr Plantagenet answered, in his blindest tone, turning round to his wife with apologetic suavity. 'The fact is, I have a very particular engagement this evening.—No, no, Dick, my boy: don't try to detain me. Gentlemen are waiting for me. The claims of social life, my dear son—so much engaged—my sole time for the world—my one hour of recreation! Besides, strangers have been specially invited to meet me; people who have heard of my literary reputation! 'Twould be churlish to disappoint them.' And, brushing his son aside, Mr Plantagenet stuck his hat on jauntily just a trifle askew with ponderous airiness, and strolled down steps as he adjusted his Inverness cape on his ample shoulders, with the air of a gentleman seek-

ing his club, with his martial cloak around him.

He strolled out, all smiles, apologetic, but peremptory. As soon as he was gone, the three remaining elders glanced hard at one another with blank surmise in their eyes; but they said nothing openly. Only, in his own heart, Richard blamed himself with bitter blame for his unwonted indiscretion in blurring out the whole truth. He knew that by ten to-morrow morning all the world of Chiddingwick would have heard of his projected little trip to Oxford.

When the younger ones were gone to bed, the three still held their peace and only looked at each other. Mutual shame prevented them from ever outwardly commenting on the father's weaknesses. Maud was the first to break the long deep silence. 'After this, Dick,' she said decisively, 'there's no other way out of it. You've burnt your boats. If you kill yourself to do it, you must win that Scholarship!'

'I must,' Dick answered firmly. 'And what's more, I will. I'll get it or die for it. I could never stand the disgrace, now, of coming back empty-handed to Chiddingwick without it.'

'Perhaps,' Mrs Plantagenet suggested, speaking boldly out the thought that lurked in all their minds, 'he won't say a word of it.'

Maud and Dick looked up at her with incredulous amazement. 'Oh mother!' was all they could say. They knew their father's moods too well by far to buoy themselves up with such impossible expectations.

'Well, it seals the business, anyhow,' Dick went on, after a moment's pause. 'I *must* get it now, that's simply certain. Though, to be sure, I don't know that anything could make me try much harder than I'd have tried before, for your sake, mother, and for Maud's, and the children's, and the honour of the family.'

'I wish I had your faith, Dick, in the honour of the family,' Mrs Plantagenet sighed wearily. 'I can't feel it myself. I never could feel it, somehow. Though, of course, it's a good thing if it makes you work and hold your head up in life, and do the best you ever can for Maud and the children. Anything's good that's an incentive to exertion. Yet I often wish, when I see how hard you both have to toil and moil, with the music and all that, we didn't belong to the royal stock at all, but to the other Plantagenets, who left the money.'

Both Richard and Maud exclaimed with one accord at these painful words: 'Oh, don't, dear mother!' To them, her speech sounded like sheer desecration.

At the very same moment, indeed, in the cosiest corner of the *White Horse* parlour, Mr Plantagenet himself, the head of the house, was observing complacently, in a mellifluous voice, to an eager little group of admiring listeners: 'Yes, gentlemen, my son Richard, I'm proud to say, will shortly begin his career at Oxford University. I'm a poor man myself, I admit; I might have been richer but for untoward events: and circumstances have compelled me to submit in my old age to a degrading profession, for which neither my birth, my education, nor my literary habits have naturally fitted me. But I trust I have at least been a good father to my children. A good—father—to my children. I have given

them the very best education this poor town can afford; and now, though I know it will sadly cripple my slender resources, I mean to make a struggle, my friends, a manful struggle, and send my boy Richard up to Oxford. Richard has brains, undoubted brains; he's proud and reserved, as you all know, and doesn't shine in society; he lacks the proper qualities: but he has undoubted brains, for all that; and brilliancy, I know to my cost'—here he heaved a deep sigh—'is often a pitfall to a man of genius. Richard hasn't genius; but he's industrious and plodding, and possesses, I'm told, a remarkable acquaintance with the history of his country. So I've made up my mind to brave the effort and send him up to our ancestral university. He may do something in time to repair the broken fortunes of a respectable family. Gentlemen,' Mr Plantagenet went on, glancing round him for confirmation of his coming statement, 'I think you'll all bear me witness that I've never boasted or bragged about my family in anyway: but you'll all admit, too, that my family is a respectable one, and that the name I bear has not been wholly undistinguished in the history of this country.—Thank you, sir; I'm very much obliged indeed to you for your kindness: I don't mind if I do.—Brandy, if you please, as usual, Miss Brooks—and a split soda.—Gentlemen, I thank you for your generous sympathy. Misfortune has not wholly deprived me, I'm proud to notice, of appreciative friends. I will drain this sparkling beaker, which my neighbour is good enough to offer, to an appropriate toast—the toast of Success to Richard Plantagenet of Durham College, Oxford.'

TOUCH AND TASTE IN ANIMALS.

No one doubts that animals have sense, but most of us know comparatively little about their senses. Is sight a universal gift? Do animals recognise each other, and if so, how? Can all creatures, even those low in the scale of creation, hear and taste and smell? What is the meaning of the variety of sounds, with all their curious inflections, often so unpleasant to our ears, that are made by animals? These and many similar questions can now be at least partially answered; for both American and English naturalists have been lately working at this subject, and with their help we propose to try to find out what are the senses that various animals possess; although, as Fabricius, the pupil of Linnæus, said many years ago, 'nothing in natural history is more abstruse and difficult than an accurate description of the senses of animals.'

By a sense we mean that certain special nerves, on receiving an appropriate impulse, convey it to the brain, where it is translated (how, is as yet unknown) into its special sensation. We usually speak of ourselves as having five senses—smell, taste, touch, sight, and hearing.

With two senses—Touch and Taste—direct contact is necessary before a sensation is excited; these two we will therefore consider first, more especially as touch has been called 'the mother of all the senses,' and appears to exist, though in a varying degree, in the whole animal kingdom.

Touch is simply a sense of pressure or a sense of force as distinguished from the sense of heat,

which, though usually included under the same name, is really quite a different sensation. Thus we have certainly six senses, and possibly others, such as the magnetic sense, as yet unrecognised. Animals may have this sense of warmth in a more highly developed degree than man, and there is no doubt that it is a source of keen enjoyment to many. One or two curious facts have been noticed in connection with this sense: a cold body feels heavier than a hot one of precisely the same weight; our left hand is more sensitive than our right; and if our elbow be dipped into a very cold fluid, while the cold is felt at the elbow, pain is felt at the tips of the fingers!

We have no separate nerves for pain; it is probably only an intense pressure or irritation of the nerves themselves—not of the end-organs of touch—this, carried beyond a certain point of intensity, causes pain. Perhaps that is why pain and pleasure are so closely allied; for if the ordinary nerves of touch convey both sensations, and the difference is mainly one in degree of intensity, it would naturally be difficult to draw any boundary-line: a slight pressure may cause pleasure; a greater one, pain; and we do often actually find that a sensation of pleasure merges insensibly after a time into one of pain. We have many indefinite sensations—not on the surface nor of any particular locality—such as a feeling of general comfort and well-being, or one of *malaise* and discomfort, of horror, &c., caused by the excitation of various nerves.

Man has the greatest number of sensory nerves; they become fewer as we descend in the scale of creation, and some of the lower invertebrates apparently have none, hence they can have little or no sense of pain. Even in the higher creatures pain appears often deadened, possibly by some hypnotic influence exerted by means of the eyes of beasts of prey, or Nature may not after all be so cruel as she sometimes appears. A camel when shot was observed to go on calmly chewing the cud, taking no notice of its bleeding wound. The same indifference has been observed in the reindeer, and even in the horse. A lobster will voluntarily deprive itself of its great claws if startled; and a crab goes on eating while being itself devoured. A fish, though torn by the hook, still returns to the bait; and a blindworm or sand lizard, if seized, snaps its body in two, and glides away unharmed to reproduce at leisure the lost part.

The sense of touch in man is most highly developed on the skin; but mucous or serous surfaces are also capable of conveying tactile impressions. Some parts of the body are more sensitive than others, and are usually devoid of hairs, as the tip of the tongue, the ends of the fingers, and the lips. It will be noticed that these are so situated as to keep us conveniently informed of what is going on around us.

Some of our most important organs—for instance, the heart, the brain, and the lungs—are, strange to say, quite insensible to touch; thus showing that not only are nerves necessary for the sensation, but also the special end-organs. This curious fact was noticed with the greatest astonishment by Harvey, who, while treating a patient for an abscess that caused a large cavity in his side, found that, when he put his fingers into this cavity, he could actually take hold of

the heart without the patient being in the least aware of what he was doing! This so interested Harvey, that he brought King Charles I. to the man's bedside that 'he might himself behold and touch so extraordinary a thing.' In certain operations, a piece of skin is removed from the forehead to the nose; and it is stated that the patient, oddly enough, feels as if the new nasal part were still in his forehead, and may have a headache in his nose!

In the lower organisms, as the molluscs, the whole outer skin is sensitive; but some have also specialised organs of touch; these are usually hair-like processes. Thus, jelly-fish shoot out numerous threads, when touched, which enable them to attack the body pressing them. In fishes, touch is usually limited to the lips, parts of the fins, and to special organs called 'barbels;' these are long pieces of skin. Fish may sometimes be seen gently touching strange objects with the sides of their bodies, as though thus becoming acquainted with them. Blind cod are quite able to continue foraging for themselves—probably by means of touch aided by smell.

The skin of crustaceans and of insects is more or less horny, or, as has been said, the bee wears its skeleton outside; but even this armour-like surface is sensitive to touch, owing to little hairs or projecting rod-like bodies seated on the coat, from the base of which a nerve-fibre passes through into the body. These little hairs are very numerous on the antennæ of insects; and are evidently sense-hairs of some kind, some of touch, others of other senses. The sense of touch is marvellously developed in spiders.

Bats have an extremely keen sense of touch, probably the most delicate of any creature, and are guided in their flight chiefly by this sense. They have been purposely blinded for the sake of experiment, and then let loose in a room where an intricate network of string had been arranged. This network was never once touched by the bats during their flight. In other experiments, it was noticed that they wisely gave a wider berth to such things as a man's hand or a cat's paw than to harmless pieces of furniture. They can also fly along underground and quite dark passages, avoiding the sides, even when a turn or twist comes. The wings and other membranous expansions are peculiarly sensitive to touch, but these expansions are comparatively small in the fruit-eating bats; for it is the insect-eating bats, who have to be on the alert in order not to starve, who need this excessive keenness of the sense of touch. Sight is useless in the gloom, and it appears to be by the minute changes of pressure in the atmosphere that they recognise the approach of their prey.

There is a similar wonderful sensitiveness to changes of pressure in those whales which prey upon herrings and mackerel, and therefore need both a keen sense and the ability to swim swiftly in order to obtain a meal. It seems odd to us that it should never have occurred to these nor to other strong creatures to employ the weaker creatures to hunt for them and feed them, while they take their ease; but, though their life appears to be one of constant toil and warfare, the mere pursuit of their prey must give pleasure. No caresses nor allurements of dainty food will beguile a cat from its hunt for a mouse; though

the mouse is often not eaten, even when caught. Is the love of sport in man a survival of this instinct, and will it be eradicated as the higher instincts of nature are developed? To return, however, to our whales. Some slight change in the movement or impulse of the water appears sufficient to indicate to them the approach of shoals of fish, or even of sunken rocks. Whale-fishers also state that when they attack a whale, others, even when some miles away, become, in a way quite mysterious to our coarser perceptions, aware of the struggle, and hurry off to the rescue. It is almost impossible to believe that the vibrations of the water could be sufficient to warn them of their comrade's danger at so great a distance.

Sometimes the chief tactile organ is the tongue, as in snakes; sometimes it is the foot, as in climbing reptiles, birds, and even some insects. The tails of monkeys are also keenly sensitive; while in cats and other feline creatures the whiskers have the most delicate sense of touch, and in rabbits the long hairs on their lips, owing to the nerve filaments at their base. Seals and walruses, too, have similar sensitive strong whiskers, which are as useful to them as a staff to a blind man.

Many birds have special tactile organs round the root of the bill; these are doubtless useful to the bird, as it probes the ground to hunt for its dinner of worms, grubs, &c., and may also be of use in nest-building. Ducks and geese have similar special bodies. Hoofed quadrupeds, to complete this brief summary, have somewhat sensitive hoofs, enabling them to test the firmness or otherwise of the ground; though the most sensitive parts in horses and most animals are the lips, and in the elephant the end of the trunk.

Taste, though the most limited in range of the senses, serves a special and useful purpose; for unless we, in common with other living creatures, took pleasure of some kind in our food, we might cease to eat, and die of starvation; or, if food had no taste, we might unconsciously eat what is unsuitable, or even poisonous. Probably the whole creation has this sense of taste in a varying degree; certainly insects have, and with them, as with man, it develops and increases during life: some young insects will eat poisonous food that older ones refuse to touch. This is also said to be the case with lambs, which, if left to graze in a field without their mothers, often die from eating poisonous herbs. In man, as we all know, taste can be educated; as, for example, with tea and wine tasters, who can detect differences of quality quite inappreciable to others.

A singular development of this sense is seen in those insects which eat different food when in the larval and when in the perfect condition: the butterfly or moth, for instance, would not touch the leaf on which it lays its egg; yet this forms the right food for the grub that will emerge from the egg. It is not to be supposed that the butterfly remembers its early existence, and reasons from this as to the probable food that its young will require; so, in a happy tone of satisfaction, we call this 'instinct,' and think our explanation complete. But is not that word merely used to cover our ignorance; for, after all, what is instinct?

Who can define it, or say where instinct ends and reason begins?

Many experiments have been made in order to find out what and where the organ of taste is in the lower creation; but it is easier to say where it is not. Crayfish and worms seem to have very decided preferences in the matter of food, though no special taste-organ has yet been found. Lobsters like decaying food: the crab is more dainty in its diet. Snails and slugs show a decided preference for certain kinds of food, as garden-lovers know to their cost; peas and cabbages, dahlias and sunflowers, are great favourites; but they will not touch the white mustard. Some prefer animal food, especially if rather high! Spiders have only a slight sense of taste; flies soaked in paraffin seem quite palatable to them; though one species, the diadema, is somewhat more particular, and refuses to touch alcohol in any form whatever. The antennæ of insects do not appear to contain any organ of taste, for wasps and ants quite readily took into their mouths poisonous and unpleasant food, even swallowing enough to make themselves ill; while some bees and cockroaches fell a prey to the temptation of alum, Epsom salts, and other nauseous foods placed in their way. These substances were not, however, swallowed, but were soon spat out, the creatures spluttering angrily, as if disgusted with the taste. The proboscis of the fly and the tongue of bees and ants are furnished with numerous delicate hairs set in minute pits; these are perhaps connected with the organ of taste; but though the exact locality of this sense in insects is uncertain, we know that groups of cells in the tongue of animals, called taste-bulbs, form, in part, the ends of the organ of taste. These vary in number, increasing in the higher animals; they are very close and exceedingly numerous in man, while the tongue of even the cow has some thirty-five thousand taste-bulbs. It would be interesting to know, but I have never seen the question discussed, whether each special taste excites a special group of nerves, and that only—thus corresponding to the auditory nerves.

These taste-bulbs were discovered in 1867. Each one consists of two kinds of cells, one set forming an outer protective covering, through an opening in which project from five to ten of the true taste-cells. Though important, they are not apparently an essential part of the organ, for birds and reptiles have none; but neither have they a keen sense of taste—except perhaps the parrot. A boa-constrictor that was nearly blind was once found to be contentedly swallowing a blanket for dinner, instead of a rabbit, which was also within reach; and it was only with great difficulty that she was forced to disgorge this singular article of food. A snake's tongue is therefore not an organ of taste, nor is it, as many think, a sting; it is more probably a delicate organ of touch. Professor Lloyd Morgan in his fascinating book, *Animal Sketches*, mentions the very curious effect that nicotine has upon snakes. Even a drop of the oil from a foul pipe, if placed in the mouth of a snake, will cause it to become perfectly rigid; if more be given, it will die. Possibly, as has been suggested, it may be in some such way, or by mixing opium or other narcotic with the saliva, and then spitting into the snake's mouth, that Indian charmers

effect some of their wonders with even poisonous snakes, such as apparently turning them into sticks and so on.

A special organ on the edge of the beak appears to serve as an organ of taste in ducks; while fish and tadpoles have goblet-shaped sense-organs on their skin and scales, and though their purpose is somewhat uncertain, they are similar to taste-bulbs; and fish certainly have some, though only a slight, sense of taste. Some fish repeatedly rejected certain molluscs given them as food; while others appeared to owe their safety to their colouring; thus showing that fish can see and recognise markings, and also that they do exercise some choice in the matter of food.

A very sad account is given by Sir J. E. Tennent and Mr F. Day as to the habits of certain frugivorous bats—the so-called ‘flying fox’ of Southern Asia. Not only are they very quarrelsome and selfish, fighting over their food, and each one trying to get the most shady spot to sleep in; but they are sadly dissipated; and although strict vegetarians, very intemperate. They frequently pass the night in a sort of drunken carouse, returning home—unless too stupefied to stir—in the early morning quite intoxicated and more quarrelsome than ever. Instead, therefore, of saying that a man who drinks to excess behaves like a beast—which is quite untrue, by the way—we might more truly say that he is like a bat.

But we must leave this branch of our subject after one more remark. The sense of taste protects the alimentary canal, so preserving us to some extent, at all events, from swallowing poisonous food. Only substances that are soluble in the mouth produce a distinct sensation of taste; others merely exciting a sensation of touch or of temperature; and these substances must come into *direct* contact with the special nerve-endings.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXVI.—PLENARY CONFESSION (continued).

‘I SHALL not forget it. Nevertheless, Elsie, if a statement of the facts can be of any use to you—he changed his seat and took up the pen—‘certainly I will write it for you.’

‘I am requested,’ he wrote, ‘by Miss Elsie Arundel, my Scholar, to state what I know of a certain transaction which took place in March 1882. The facts are as follows: I had need of a sum of seven hundred and twenty pounds. For certain purposes I wanted it in ten-pound notes. I asked my agent, Mr Dering, to give me a cheque; and as I thought that I should want the money immediately, perhaps in an hour or so, I asked him to make it payable to my order, and not to cross the cheque. He drew the cheque and gave it to me in his office. I then went to the hotel where I was stopping—a place in Norfolk Street, Strand, and sent a commissionaire to the Bank for the money. He brought it, as I had requested, in ten-pound notes. In a few

days I discovered that my plan could not be even commenced without the greatest danger of defeating its own object. I therefore took the notes to Mr Dering’s office and placed them in his safe. I suppose that he has long since returned them to the Bank.’

‘There, child,’ he said, reading this statement aloud. ‘That is what I recollect about this matter.’

‘Sign it.’ Elsie gave him the pen again. ‘Sign it, dear Master.—Oh! thanks—thanks a thousand times! You don’t know—oh! you will never know or understand—I hope—how precious this document will be for me,’—she folded the paper in an envelope and placed it in her hand-bag—‘and for my people—my brother and all. Oh, my dear Master!’ She stooped and kissed his hand, to hide the tears in her eyes. Athelstan’s name was safe now whatever happened. He would be completely cleared at last.

‘Why, my dear Scholar—my dear daughter.’ Mr Edmund Gray was moved himself almost to tears at this unexpected burst of feeling. ‘As if there was anything I would not do for you if I could. I, who have never loved any woman before, love one now. She is my daughter—my grandchild.—So your brother will be helped by this little reminiscence—will he? Actually, your brother! I wonder if there is anything more that I could remember for you in this uneventful life of mine.’

‘Oh no!—that would be too much to hope. Yet there is a chance—just a chance. I wonder if I may tell you. There is still time before us. If we are at the Hall by six we shall do very well. It is no more than half-past four. Shall I tell you the trouble? Oh! But it is a shame. And you with this great work laid upon you! No—no—I must not.’ Oh, Delilah! oh, Circe! for she looked as if, in spite of her unwilling words, she wanted to tell it very badly indeed.

‘Nay, my dear. You must, and you shall.—What? You are in trouble, and you will not tell me what it is. You—my Scholar—my clear-eyed disciple, who can see what these dull creatures of clay around us can never understand—you are in trouble, and you hesitate to tell me?—Fie! fie! Speak now. Tell me all.’

‘I have told you that I have a lover, and that I am engaged to be married.’

‘Yes—yes. His name, too, you have told me. It is George—George Austin. There were Austins once—I seem to remember—but that does not matter.’

‘We are to be married on Wednesday.’

‘So soon? But you have promised that I shall not lose my pupil.’

‘No, dear Master. As soon as we come back from our holiday, I will come and see you again and learn of you. Do not doubt that. I can never again let you go out of my life. I shall bring my—my husband with me.’

‘If I thought your marriage would take you away from me, I should be the most unhappy of men. But I will spare you for a month—two months—as long as you please.—Now, tell me what is on your mind.’

‘George was one of Mr Dering’s managing clerks—your Mr Dering, you know.’—Mr Edmund Gray nodded gravely.—‘He had no money when we were engaged, and we thought that we

* Copyright 1892 in the United States of America by Harper & Brothers.

were going to be quite a poor and humble pair. But a great piece of good fortune happened to him, for Mr Dering made him a Partner.'

'Did he? Very lucky for your friend. But I always thought that Dering ought to have a Partner. At his age it was only prudent—necessary, even.'

'So we were made very happy; and I thought we were the luckiest couple in the world. But just then there was a discovery made at the office—a very singular discovery—I hardly know how to describe it, because it is not quite clear to me even yet. It was concerned with the buying or selling or transfer of certain stocks and shares and coupons and that kind of thing. Mr Dering seems not to remember having signed the papers concerned. There is a fear that they are in wrong hands. There is suspicion of forgery, even. I am ashamed even to mention such a thing to you, but my lover's name has been connected with the business; and Dering's clerk, Checkley—you know Checkley?'—

'Certainly—Dering's old servant.'

'Has openly charged George—on no evidence, to be sure—of having forged the letters, or of having assisted in the forgery.'

'This is very serious.'

'It is very serious; but we do not intend to let the thing interfere with our wedding. Only, unless I can remove the last ray of suspicion before Wednesday, we shall spend our honeymoon at home, in order to watch the case from day to day.'

'Buying or selling stocks? Dering would be constantly doing that.'

'It appears that these transactions were the only things of the kind that he has done this year. That is to say, he denies having done these.'

'Well—as for these having been the only transactions of the kind, he managed a good bit of such business for me this last spring.'

'Did he? Do you remember the details of that business?'

'Clearly. It was only yesterday, so to speak.'

'Was it the purchase or transfer of stock or shares?'

'Certainly. To a very large amount. I have told you about my Industrial Village, have I not? The Village where all are to be equal—all are to work for a certain time every day, and no longer—all are to be paid in rations and clothes and houses, and there is to be no private property—my Ideal Village.'

'I know. A lovely Village.'

'It was early in the spring that I finished my designs for it. Then it occurred to me that it would be well if, instead of always going to my lawyer for money, I had a large sum at my command lying at my Bank. So I instructed Dering to transfer to my name a great quantity of stocks lying in his name. He was a trustee or a—well—it is rather unusual, but I like having all my business affairs managed for me, and—But this will not interest you—this with the look of irritation or bewilderment which sometimes passed over his face. 'The important thing is that it was done, and that my Bank received those transfers, and has instructions to receive the dividends.'

'Oh! And has all the papers, I suppose?'

'It had them. But I thought that perhaps my old friend might think it looked like want of confidence if I left them there, so I sent for them, and took them to his office. They are now in the safe. I put them there myself with my own hand; or he did with his own hand—I forget. Sometimes—it is very odd—when I think of things done at that office, I seem to have done it myself; and sometimes I think that he did it. Not that it matters.'

'Not at all. The papers are actually in the safe again?'

'Certainly. I—that is—he—he or I—put them there.'

'Oh! my dear Master'—Elsie clapped her hands—'this is even more important than the other. You do not know—you cannot guess—what mischiefs you are able to stop. If I had only been able to talk to you about these things before! The paper you have already written is for my brother. Now sit down, my Master, and write another that will do for me.'

'I will do anything you ask me—and everything. But as for this, why not ask Dering? His memory never fails. His mind is like a box which holds everything and can never be filled. Perhaps he would not like these private affairs—as between solicitor and client—to be talked about.'

'We cannot go to Mr Dering. There are certain reasons which would not interest you. All we want is a clear, straightforward statement, an exact statement, of what happened. Sit down now and write me a full account of each transaction.'

'Certainly; if it will be of the least use to you.'

'Early in the present year,' he began, 'I found that my plan of an Industrial Village if it was to be carried into effect would want all the money I could command. It occurred to me that it would be well to transfer a certain sum from the hands of my agent and to place it in my own Bank ready to hand. I began then, in March, with a sum of six thousand pounds, which Dering, by my instructions, handed over to my Bank in the form of shares and stocks. I believe they were transfers of certain stocks held by him in his own name, but forming part of my fortune—my large private fortune. The Bank was instructed to receive the dividends in that sum. A month or so later I obtained from Dering other stock to the value of twelve thousand pounds, the papers of which were also given to my Bank. And after that I took out papers representing twenty thousand pounds; so that I had in my hands, ready to be sold out and used at a moment's notice, no less than thirty-eight thousand pounds. All this money I intended to devote to my Industrial Village. The scheme is still one in which I put my whole confidence. But it has not yet been carried into effect, in consequence of the difficulty of finding working men equal to the situation. They understand working for the man who has the money; they do not understand working for the man who has none, that is for each other and for themselves. For my own part I could only find working men of that stamp. Perhaps I am too much in the study. I do not go about enough among working men. There must be some advanced to my stage

of development.—Well, for want of men, I could not start my Village, and I have not used the money. As for the papers, I have taken them out of the Bank and placed them in Dering's safe.'

Elsie looked over his shoulder, reading every word. 'The letters which Mr Dering wrote to the stockbroker in accordance with your instructions. They were written for him—perhaps—by you. It is unusual, but'—

'I told you,' he replied sharply. 'What is the use of saying things twice? There are some things which confuse a man. I wrote them—he wrote them—he acted for me—or I acted for myself. What matter? The end is as I have written down for you.—Now, will this paper be of any use to you?'

'Of the greatest use. Please sign it, dear Master.'

He obeyed, and signed 'Edmund Gray.'

'There is one thing more.' Elsie saw in his face signs of disquiet, and hastened on. 'You have got your Bank book here?'

'Yes. The Manager sent it here with an impertinent note about references, which I have sent on to Dering.—What do you want with the Bank book? It is in one of those drawers. See—here it is—cheque book too.'

'If I were you, Master, I would have no more trouble about the money. You have given Mr Dering the transfers and papers—why not give him back the money as well? Do not be bothered with money matters. It is of all things important to you to be free from all kinds of business and money matters. Who ever heard of a Prophet drawing a cheque? You sit here and work and meditate. You go to the Hall of Science and teach. It is the business of your friends to see that all your necessities are properly supplied.—Now, if you will in these minor matters suffer your friends to advise.'—

'Surely. I ask for nothing else.'

'Then, dear Master, here is your cheque book and here your Bank book. Draw a cheque payable to the order of Edward Dering for all the money that is lying here—I see it is seven hundred and twenty-three pounds five shillings and threepence.—I will take care of the cheque—so.—Oh! you have signed Edward Dering—careless master! Draw another—now sign it Edmund Gray.—That will do—And you had better at the same time write a letter to the Bank asking the Manager in future to receive the dividends for the account of Mr Dering. I will write the letter, and you shall sign it. Now—no—no—not Edward Dering—Edmund Gray. Your thoughts are wandering.—There!—Now, dear Master, you are free from everything that might trouble you.'

The Master pushed back the blotting pad with impatience, and rose from the chair. Elsie took possession of the signed cheques, the cheque book, the Bank book, and the letter. She had all—the statement in Edmund Gray's own handwriting—all—that was wanted to clear up the business from the beginning to the end. She put everything together in her handbag. She glanced at her companion: she perceived that his face was troubled. 'I wish,' he said fretfully, 'that you had not worried me with those questions about the past. They disturb me. The current of my

thoughts is checked. I am full of Dering and his office and his safe—his safe—and all'—

Elsie trembled. His face was changing—in a minute he would have returned to Mr Dering, and she would have had to explain. 'Master,' she cried, laying her hand upon his arm, 'think. We are going to the Hall of Science—your Hall of Science—yours. The people are waiting for their Prophet. You are to address them. To-night you must surpass yourself, because there are strangers coming. Tell us—once again—all over again—of that world where there is no crime, no suffering, no iniquity, no sin, no sorrow—where there are no poor creatures deprived by a cruel social order of liberty, of leisure, of comfort, of virtue, of everything—poor wretches born only to toil and to endure. Think of them. Speak for them. Plan for them. Make our hearts burn within us for shame and rage. Oh Master'—for his face was troubled still and doubtful, as if he was hovering on the border-land between himself and his other self—'no one can speak to them like you: no one has your power of speech: make them feel that new world—make them see it—actually see it with their earthly eyes—make them feel it in their hearts.'

'Child'—he sighed; his face fell back into repose—'you comfort me. I was falling—before you came to me I used often to fall—into a fit of gloom—I don't know why. Something irritates me: something jars: something awakens a feeling as if I ought to remember—remember—what? I do not know.—I am better now. Your voice, my dear, at such a moment is to me like the sound of David's harp to Saul. It chases away the shadows. Oh! I am better already. I am well. If you want to ask any other questions, do so. As for those transactions—they are perfectly correct in form and everything. I cannot for the life of me understand why Dering, who is a practical man'—

'Never mind Dering, my dear Master—or those transactions. Think only of the world of the New Humanity. Leave the transactions and the papers to me. I hope that you will never find out why they were wanted, or how they were to be used.—Now let us start. We shall be in excellent time.'

The Hall of Science was half full of people—the usual gathering—those who came every Sunday evening and took the simple feast of fraternity. The table was spread with the white cloth, on which were laid out the toast and muffins, the ham and shrimps, and bread and butter and watercresses; and on the appearance of the Chief, the tea was brought up, and they all sat down. Now, it had been observed by all that since the adhesion of this young lady the Leader's discourses had been much more confident, his manner had been clearer, his points more forcibly put. This was because, for the first time, he had had an opportunity of discussing his own doctrines with a mind able to follow him. Nothing so valuable to a teacher of new things as a sympathetic woman for listener and disciple. Witness the leading example of the Prophet Mohammed. Also, their leader had never before been so cheerful—so hopeful—so full of life and youth and spring. He was young again: he talked like a young man, though his hair was gray. This was because

he loved a woman, for the first time in his life : he called it paternal affection : whatever kind of love it was, it worked in him the same miracle that love always works in man—young or old—it gave him back the fire of youth.

This evening he sat at the head of the table dispensing his simple hospitality with a geniality and a heartiness unknown before the arrival of this young lady. He talked, meantime, in the lofty vein, above the style and manner common to his hearers, but not above their comprehension : he spoke of a higher life attainable by man at his best, when the victory over nature should be complete, and every force should be subdued and made slave to man, and all diseases should be swept away, and the Perfect man should stand upon the earth at last, Lord and Master of all—Adamus Redivivus. When that time should come, there would be no Property, of course ; everything was to be in common ; but the new life would be full of love and joy : there would be long-continued youth, so that none should be made to rise from the feast unsatisfied : nay, it seemed to this Dreamer that every one should continue at the feast as long as he pleased, till he was satiated and desired a change. Long-continued youth : all were to be young and to keep young : the girls were to be beautiful and the men strong : he pronounced—he—the hermit—the anchorite—the celibate who knew not love—a eulogy on the beauty of women : and he mourned over those men who miss their share of love.

The hearts of those who heard were uplifted, for this man had the mesmeric faculty of compelling those who heard him to feel what he wanted them to feel. Most of them had been accustomed to regard their Leader as a man of benevolent manners but austere principles. Now he was tender and human, full of sympathy even with those weak vessels who fall in love, and for the sake of love are content to be all their lives slaves—yea, even slaves to Property.

After tea, the tables being cleared, the Chief pronounced his weekly address or sermon. It was generally a discourse on the principles, which all professed, of equality and the abolition of Property. To-night, he carried on the theme on which he had spoken at tea-time, and discoursed on the part which should be played by Love in the New Humanity. Never before had he spoken so convincingly. Never had orator an audience more in sympathy with him.

Shortly after the beginning of the address, there arrived two gentlemen, young and well dressed, who sat down modestly just within the door and listened. The people turned and looked at them with interest. They were not quite the kind of young man peculiar to the street or to the quarter.

When the lecture was over and the audience crowded together to talk before they separated, Elsie slipped across to the new-comers and led them to the lecturer. 'Master,' she said, 'this is my brother Athelstan.'

Mr Edmund Gray shook hands with him. 'Why, Elsie,' he said, 'your brother and I have met already in Gray's Inn.'

'And this is my friend George Austin, Partner of Mr Dering.'

'Mr Austin,' said Mr Edmund Gray, 'I am

glad to meet the man who is about to enter into the most sacred of all bonds with one whom I venture to love, sir, as much as you yourself can do, though I love her as my daughter, and you love her as your bride. You will be the happiest of men. Take care, sir, that you deserve your happiness.'

'This day,' said Elsie, 'you have rendered us all such a service as can never be acknowledged, or repaid, or forgotten. Yet we hope, and pray that somehow you will never understand how great it is.'

WHEAT-THRESHING IN NORTH-WEST CANADA.

THE harvest of 1891 in North-west Canada was the largest Canada has ever had, and it was at the same time the most disappointing. The frost and the smut combined have made a good yield and promising-looking crop almost profitless to the settler. It has also been the crop we have worked the hardest to save. The harvest was late and labour scarce ; a couple of men did the cutting, setting-up, and stacking on most farms in this district. Of course, this without self-binders would have been impossible ; very often each man of such a couple would be the owner of sixty or seventy acres of wheat ; and they would join together to put up the harvest of both farms. In some cases, some isolated bachelor was farmer, labourer, cook, and housemaid all in one ; he, if any one, could appreciate that song where some individual introduces himself as being the 'boat-swain bold and crew of the captain's gig,' besides covering a lot of other persons in his one skin. In this part of Assiniboia the stacking was not finished till the beginning of November, and then the snow came and covered the shocks of several belated ones. After the snow the threshing-machines came ; and from then till the beginning of March they kept steadily at their work, and still there are stacks left, till seeding is finished, whose owners could not get a threshing outfit who had time to come to them. The way in which threshing is carried on in this as in most places round here is on the 'bee' system, but which is likely soon to be replaced by each machine taking a gang of men with it.

But at present when an engine and machine come on to a farm, the settlers for six miles round who have grain to be threshed meet there, bringing their pitchforks with them. The married men, who have cows and pigs, &c., at home to be attended to, come with their teams and wagons, and go home at night. The bachelor turns all his live-stock adrift for forage for themselves, mounts his pony, taking his fork and toilet apparatus—which last is represented by a pipe and plug of tobacco in most cases—with him, and possibly an ox-hide and blanket. He camps in every house he threshes at, if the house belongs to a fellow-bachelor. A corner—the farthest from the door for choice—is bedded down with an armful of straw ; on this, covered with blanket and hide, he sleeps as soundly as he does in the bed which the farmer's wife provides for him when the threshing reaches that kind of a farm.

A shanty twelve by fourteen feet is large

enough to accommodate six men at night, and to cook for and feed twice that number during the day. With the thermometer down in the zeros, there is no complaint about stuffiness. A knot-hole in the wall not big enough to shove your finger through is amply sufficient to keep the air of the house thoroughly pure, and to allow a few cubic feet of snow to trickle through on to the floor or the sleepers below.

As soon as the engine has got up steam—a difficult matter on a cold day—and enough hands have arrived, a start is made. The machine sits between two stacks, which are threshed together; three men get on to each stack, or, as a general thing, the whole crowd get on each, and pretend to ignore the fact that the straw-carriers or grain-spout require any human attention whatever. This little oversight is pointed out to them by the machine-men; and after all have claimed to have mounted the grain-stack before any one else, some of the most good-natured sorrowfully climb down, to submit to a martyrdom on the straw, for which they look only for the public's anathema if they fail to keep the straw away and let the carriers 'bung.' As for any reward for hard work in the way of praise, they know too well that it is the peculiar attribute of that part of the machine that, although hard work and all the dirt come that way, the men on the straw need not look for praise.

With three men on each grain-stack, two more men standing one on each side of the feeder, to cut the bands of the sheaves and pass them to him along the feed-table; and three men on the straw, who stand in line one behind the other, passing the straw from man to man, piling it up anyhow as long as they can keep the mouth of the carriers free; and when the grain-spout runs into a large bin, one hundred bushels an hour is only an ordinary average when the grain is good. But when, as in this last threshing, there are only two on the grain, and that only on one side, and two on the straw, the above average might be divided by five.

The most unpleasant part about the machine is the part of the men on the straw; this is especially so when the grain is smutty; then they are wrapped in an ink-black cloud, which clogs up all the passages to the lungs, all the more distressing from the soft deep footing of the newly-threshed straw, which helps to rob them of their breath, by keeping them continually climbing to avoid being buried, and so forcing them to inhale the smut in large quantities. These men come off at dinner-time from the straw with a crust of black as thick as a dollar over their faces, their eyes streaming and bloodshot, an itching smarting skin, and a feeling as of a tremendous cold in the head. But in spite of all, every one seems to keep his appetite; and the food at a threshing is always splendid; 'as good as threshing-grub' is a well-known saying to describe anything in the line of good victuals.

Dinner is generally beefsteak, as often as you like to reach for it, with turnips and potatoes; besides which, cakes of various and curious kinds; and pies of apple and apricot wander from hand to hand about the table. The teacups are kept full, and you catch the milk and sugar for yourself, and fix your tea as you think it

should be fixed. Towards the end, a large plate of plum-duff is given each man; and as soon as that is finished, there is a general dive into trouser-pockets and the pipes fished up and filled; and all leave the table cautiously, and avoiding all chance of a collision, or anything that might jar the system; then, on the chairs and floor farthest from the table the crowd sit down to smoke and debate over many things amongst each other. A subject is usually chosen in which all are comfortably out of their depth, and then while the women-folk wash the dishes, and we wait for the engine's whistle, the subject is argued over in all its bearings, some of which probably were never suspected before to have any relation whatever to the question in hand; and it is not at all uncommon for an argument that started in politics to be hunted all through religion, and only escape death in astronomy by the whistle sending all the keen hunters into their overcoats, fur caps, and mittens, and hurrying them out to their places round the machine.

Many days of this last winter, threshing was carried on though the thermometer marked thirty below zero, and the day was not the beginning and end of work; for often, as it grew dark, a man would be told off to keep a straw bonfire going, and then work would be carried on by its light three hours after dark. It is a curious sight for any one, after a long tramp across the still prairie in the darkness, to come suddenly to the bank of a creek or valley-edge and see a threshing outfit in full blast at the bottom, as once I did after about an hour's walk. The night was dark and thick with a haze of frost; even the snow hardly showed bright underfoot. I had felt the absolute silence and loneliness of the prairie all the more from being uncertain whether I was walking in the direction of home, or only just wandering around, and I suspected myself of the latter. There were no stars or wind to guide me; suddenly, a faint hum of a threshing-machine caught my ear. I followed it; and after some twenty minutes I came to the brink of the steep bank of a creek, and there in the bottom, in a blaze of red and yellow light, was a threshing outfit hard at work. It looked like a living picture let into an eternity of darkness and silence, as though it was one little spot where all the life that remained in this world had met, and made a small kingdom of light in the middle of an eternity of darkness and space. The haze was so thick that the snow, one hundred paces from the straw fire, did not reflect the light; but the snow round the stacks shone brilliantly, and lit up the smoke that curled in heavy billows and columns above the men's heads with a bright yellow glare; while the red-hot heart of the fire itself, and the raked-out ashes of the engine that was spluttering away in the half-light of the background, coloured the smoke and steam above them a deep red, which gave a warm look to the whole—a look only, for many were complaining of freezing fingers. I was not sorry I had lost my way. I was in time for supper, and supper is much on the same lines as dinner at a threshing.

But although the yield was from thirty to sixty bushels the acre, the wheat, in spite of smudges against frost, and blue stone against

smut, is both frozen and smutty, and in many cases the farmer would have been both money and labour to the good if he had sown no wheat at all. Wheat unfrozen, plump, and sound, and hard, gets only one shilling and twopence a bushel from the local buyers of the big firms if ever so slightly discoloured at the tip of the kernel by smut, 'tagged' as it is called. That is, the settler who has not enough grain to make a car to ship east only gets that; if he can do that, some say there is an astonishing difference in the price, enough to almost reconcile him to his loss by smut; but I can't speak from my own experience, as I had not enough to try.

THE DECK HAND.

CHAPTER II.—CONCLUSION.

CONTRARY to Genth Hurley's expectations, Tom Harrington took the berth offered him. A week after the interview in the office, he sailed in the *Comet* for the fishing-grounds of the North Sea. Eight weeks, long and dreary to those at sea, soon pass ashore. To Genth, in the office, time flew. The morning the *Comet* was due again found him nervously pacing the quay. He had made his plans. This trip would prove Tom's salvation. He had found a desk for him in the office, and under his own eye Harrington should commence the new life. Though Genth's mind was busy, his eyes kept straying down the harbour; and at last he heard the pant, pant, pant of a tug, and saw her red-banded funnel passing the lower ferry. Astern was a dandy-rigged trawler. Scores of smacks and luggers were already moored at the quay-side, and what with scandalised sails, masts, shrouds, and dangling halliards, it was a minute or two before he could make her out. When the snake-like coil of the towrope was cast off and the tug sheered out, Genth saw the newcomer was the *Comet*. He made a step forward, then stopped as if he had been shot. His eyes were glued to her rigging. She was flying her flag half-mast high! It was not the first time Genth had beheld that ominous sign, but now it turned him faint. In his mind ran one thought—suppose it was flying for Tom Harrington! He stood for a minute fascinated, then walked gloomily back to the office. He sat there with his face buried in his hands, when the opening of the door, the sound of sea-boots, and the voice of Holmes, aroused him. 'I ken see, owner,' he said, 'you ha' been on the quay.'

'Tell me,' said Genth with dry lips, 'whom you have lost?'

The skipper of the *Comet* passed a large hand through his oakum-textured hair. 'Well, owner,' he said slowly, 'I'll speak the truth. 'Twor this way: the wind were east'—

'In God's name!' cried Genth, 'who is it?'

'To sail straight to the pint, owner, 'tis the new deck chap.'

Genth looked at him helplessly. Harrington! He had made all his little plans, and a greater Hand than his had swept them away. 'When did this take place?' he asked.

'The night afore larst. We wor acomin'

home,' said Holmes, directing his gaze to a nautical almanac, and telling his tale to it as it hung on a nail, 'wi' the wind east-nor'-east; I had jest fixed the port an' starboard lights, an' was taking a spell at the tiller. All of a sudden I sees a great green sea acomin', which I knew we'd ship, an' I sung out to the chaps to keep below. Jest as the werds passed my lips, some one popped out o' the hoodway [companion]. The sea an' him must ha' touched the *Comet's* deck at the same time; an' afore I could clutch him, he was swept over the starboard rail. I hulled a belt at him, an' put the tiller up. A'most as sune as we gat about, our boat was launched, an' the chaps were in her. They pulled like madmen; but you know, owner, how fast a drowndin' man drifts to windward. They could never git nigh him; an' when I picked the crew o' the boat up, they wor done for. They couldn't ha' pulled another stroke for the Indies. An' the deck chap was gone. All we picked up was this'—he held up a soiled sou'-wester.

'You must report it,' said Genth heavily—'it's all you can do now.'

Holmes nodded, and slouched away. When he was gone, Genth went to his desk and drew from it a sheet of note-paper; on it was written the number of a 'row.'

'And I must break the news,' he said.

On a bleak January afternoon, two years later, a man came through the tollgate. To save a mile or so, he had reached Herringbourne by a cheerless, treeless cut called the New Road. He was thin and bearded. His clothes were shabby, and his steps uncertain. As he tendered the halfpenny toll his fingers burnt like fire. The sun went down as he came through the gate, and the traveller shivered. An easterly wind was blowing. It lay in wait for him as he rounded a corner, and a roaring gust brought him up gasping for breath. But still he wearily plodded on. At last he stopped before a 'row,' went up it, and then stopped again, in front of a house with the shutters closed. On them was chalked—'To Let.' In a dazed sort of way he looked at the letters, then made his way to the quay. Here he halted at the office of Hurley's Fleet. With a trembling hand he tried the door. It was locked. Then, indeed, he seemed to lose heart, and sat a moment on the doorstep. He was looking at the black bough of a tree that flapped noisily against a lighted lamp, when a smacksman came past. The weary object stopped him and asked him where Hurley lived. He was told; and with a sigh went on again, this time towards the Drive. The sky grew darker, and it began to snow, first in light flakes, that he feebly tried to brush away, then faster. Soon he heard the roar of the angry sea, and saw the flaming eye of the Floating Light as it rocked inside the Scroby. Here the wind blew fiercer: it gathered the white flakes together and hurled them into his face till they blinded him. Staggering, clutching at iron rails, and turning his face to them when the strong gusts swept off the sea, he went on till he reached the gate of a house where the blinds were parted and the room illumined by gas jets and a merry leaping fire. By that fire

a man sat reading. It was Genth Hurley. The stranger outside opened the gate; the wind drove him up to the door, and he pulled the bell. It was answered by a servant, who gazed at him curiously. He asked if he could see the smack-owner.

'Of course you can,' she said sharply. 'But shake some of that snow off!'

He tried, but his fingers seemed numb. She impatiently beckoned him in, and left him on the mat while she informed her master a man wanted him. Before she could speak, the visitor had stolen up behind. As she drew back, he and Genth came face to face. The attitude of the shabby figure was humble, and his knees shook.

'Come in,' cried Genth cheerily—'come in, my man. You wanted to see me?'

In a hesitating way the other stepped forward; particles of snow had melted on his beard and hung in glistening drops.

'Don't you know me, Hurley?' he asked, in a trembling tone. 'I wonder if Nell will know me? I'm Tom Harrington!'

With a strange, gurgling cry Genth fell back and clutched at the mantel-piece. He seemed turned to stone. The visitor looked wistfully at the bright fire, and caressed his thin hands as if he were warming them. 'No, no!' gasped Genth hoarsely, 'not him!—not Tom Harrington! He was drowned at sea.'

'Not drowned,' said the other; and his voice sounded so gentle, so unlike the Harrington of old, that there was plenty of room for mistaking his identity; 'but picked up by a schooner, when he had lost all hope. I was carried to a strange place, and I had the fever.' He drew a little nearer the fire, and put his hand on the back of a chair; then, with a smile, he looked at Genth. Hurley's face wore an awful frozen look. He appeared cowering back.

'I'm very tired,' said the wanderer feebly. 'May I sit down? I have been to some strange places, but I'm home now; and I want to find Nell. I have been to the old house, but she was not there. But you'll help me to find her, won't you? You'll tell me where she is?'

His voice was eager, and again he looked at Genth. The door of the room was only partly closed, and through it there came a faint cry; then a soothing sound; then a cry louder than the first. The rescued man pricked his ears.

'A baby!' he said. 'So you are married. Perhaps—perhaps,' he added timidly, 'you don't want me here. I had better go. I had no right to come; but I thought you could tell me where Nell was.' He gazed again at the fire, and his shaky fingers strayed over the buttons of his threadbare coat. With an effort he staggered up.

It was only Genth's lips that moved. 'Yes, yes,' he said, in a hollow tone, 'go! And in the name of God, go quick! To-morrow—I'll see you to-morrow.'

A gust of wind drove the snow against the window. Before the fleeting patterns of the flakes were off the glass, another gust made them afresh. Harrington shivered. 'It's very cold,' he said; 'but I'll walk quick, and you'll tell me where to find Nell?'

As he put the question there sounded a rippling laugh; then the joyous snatch of a song, as some

one tripped down the stairs. The wanderer's face grew bright. He held up his hand. 'Listen!' he cried breathlessly. 'That is Nell's voice! My Nell! That is the song she used to sing long ago! Why, she is here, Hurley—she is!—' He turned wonderingly to Genth. The smack-owner's jaw had fallen; his teeth were chattering; and, trembling in every limb, he barely held up by the mantel-piece.

A puzzled look stole over Harrington's face. It cleared; and he too began to tremble. 'Your wife!' he whispered. 'You have married her! You thought me dead! I am going—I am going.' He put his hand out to feel for the door. He was trying to find the handle, when it swung open and Nell stood on the threshold. He gave a low sob, and with bent head sought to pass her. She tried to see his face.

'I am going, Nell,' he mumbled—'I am going.' He was quite helpless now, and blinded by tears.

At the sound of his voice, at the sight of the shaky figure grown suddenly old, some memory stirred her, and she clutched him by the arm. He lifted his head; their eyes met, and with a wild scream she sank to the floor.

An hour later, a doctor came. He looked at Harrington, who had been put to bed, and shook his head. 'I'm no use,' he said. 'Cold, exposure, a debilitated constitution. The man has been dying for weeks. He may last the night out; I doubt it.'

The doctor was right. Harrington gradually grew weaker and weaker. His brain wandered to strange scenes, the 'River Plate, Costa Rica: then home, and Nell. When his mind partially cleared, she was bending over him, and Genth sat holding his hand. Like a child he put up his face, and she kissed him. He looked, smiling, at Genth; then his head fell back on the pillow. 'I am going,' he said softly—'I am going.' There was a faint flutter of breath, and his eyes closed. The Deck Hand had gone.

THE DEATH OF SUMMER.

WILD Autumn winds blow chill and drear

Across the cloudy, storm-rent sky,

While hill and valley, far and near,

Folded in misty silence lie.

No sound of music fills the air,

No voice of bird along the brake;

Only the wild-fowl's cry, remote and rare,

Among the withered sedges of the lake.

Gone is the glory of the summer noon;

Gone is the tender grace of dawning light;

The soft, sweet radiance of the rising moon,

The silver silence of the starry night.

Yet, there is splendour in the waning woods,

And Summer dies, as dies a royal king,

All down the grassy glades where Silence broods

Beneath his shroud of golden blazoning;

Where amid leafy boughs, from spray to spray,

Falls the first touch of Winter's icy breath—

The first faint sign of lingering decay—

And smites the ruddy beech with crimson death.

PRICE 1½d.

THE ORIGIN OF PETROLEUM.

ANYTHING that adds to our knowledge of coal, or throws any light on the origin of the vast subterranean stores of petroleum oil and natural gas which have proved of such incalculable service to man, must be received with universal interest. A paper read by Professor Watson Smith at a meeting of the London Section of the Society of Chemical Industry does both. It principally deals with the results of his experiments on a highly bituminous Japanese coal, and the conclusions deducible from them.

This coal is produced from a mine at Miike, in the province of Chikugo, in Kiu-shiu, a large island in the south-west extremity of the Japanese Empire. The mine has the advantage of being close to the sea, and faces Shimabara Bay, from which it is some twenty miles distant. The deposit was known four hundred years ago; but as the Japanese have only learned quite recently the multifarious uses to which coal can be put, it was not worked until 1873, after the Government had purchased it at the request of its private proprietors. About 1876, the firm of Mitsui was appointed sole agents for the sale of this coal, the production having then reached three hundred tons per day. In 1885 a new shaft was sunk to a depth of two hundred and forty feet, and the output increased to twelve hundred tons per day; and in 1888 Mitsui bought the mine for about £750,000. Since then the newest machinery has been introduced into the mine, and every opportunity has been taken to improve the roads, harbours, and means of transit: a new shaft four hundred feet deep has been sunk; and the coal production for 1891 was estimated to reach the total of 600,000 tons. The coal-beds are supposed to cover an area of 3758 acres, containing some 85,444,000 tons of the mineral. The seam averages fully eight feet thick, and is of uniform and excellent quality throughout. It is coming largely into use for steam-raising, and is probably the best coal in Japan. The China Merchant Steam Navigation Company were the first to use Miike

coal on board their ships; but were soon followed by many other important firms trading in Chinese waters. Mr Thomas Weir of Shanghai minutely describes its manner of burning as follows: 'The Miike lump coal is highly bituminous, having a rather dull, rusty appearance. On first being put on the fire, it gives off great volumes of black smoke—which could be burned with careful management and suitable arrangement of furnace—and softens almost like pitch; but soon hardens, cokes, and burns brightly, giving off great heat, &c.' The reason for this dense cloud of black smoke will appear later, and is the gist of the whole argument.

It is a well-established fact, and a pretty obvious one too, that our coal deposits are nothing but masses of fossilised vegetation. Peat or turf, which covers nearly one-tenth of the entire surface of Ireland, is being rapidly formed at the present day. The principal plants that take part in this formation are bog-mosses, known under the generic name of *Sphagnum*. They grow very fast, the lower portion dying away as the upper part grows over them and shuts out the light and air; but the stems, being very wiry and persistent, form a tangled mass, which holds water like a sponge, and supplies the necessary moisture for the growth of the living portion above it. The remains of larger plants, trunks of trees, and other things, fall into it, and help more or less to assist in its formation. During heavy rains it gets silted up with mud, and is gradually converted into a solid felted mass. The softer portions of the bog-moss moulder away by degrees, and only the denser woody fibre and the resinous spores are finally left to form a store of carbonaceous material, which might in time and under proper conditions produce a kind of coal. It forms so fast in some places that Roman remains, and even Roman roads, have been found buried beneath eight feet of peat. The observations of the late Mr Binney of Manchester proved that oil flows from the peat, and it seems very likely that ozokerite, or earth-wax, is thus derived. By means of solvents, six per cent. of

oil can be extracted from peat itself. This oil, although not paraffin oil, resembled it in many respects. Oil has been found, too, under a large heath in Germany, the Luneberger Heide.

This process of peat-formation we can see going on under our very eyes, and, if there was nothing else to guide us, we should almost infer from that alone that coal had at all events a similar origin. Within the last few years, however, many facts bearing on the question have been brought to light. Coal always occurs in beds or seams, which vary a great deal in thickness. There are in general several beds in a coal-field, lying one over the other. Beneath each bed is always a layer of 'underclay' or 'seat-earth'; and the bed is covered by a stratum of shale. It is the same for every seam, no matter how many there may be. We have shale, coal, underclay—shale, coal, underclay, and so on repeated in every case. In between the underclay of one bed and the shale overlying the next, we may of course have bands of iron ore, sandstone or other water-deposited rocks; but just before we reach the coal, there is the shale, and below it the underclay, or something corresponding to it. The shale forming the 'roof' of the coal frequently contains impressions of fern-fronds, and in the underclay, fossils called 'stigmariæ' are often very abundant. These have the appearance of deeply-pitted stems, and the scars, or 'stigmata,' were thought to have been the places where the leaves were attached. In the mass of the coal, fluted tree trunks are found, called 'sigillariæ,' from the leaf-scars resembling the impressions of a seal. One day when a railway cutting was being driven through a Lancashire coal-field, it revealed a group of sigillaria trees resting on a seam of coal exactly where they must have grown, and sending down their roots into the underclay below. Mr Binney discovered that these roots were no other than the well-known stigmariæ, and that the scars themselves were the remains of rootlets, and not of leaves. It is evident from this that the fossilised vegetation grew where it is formed, as peat does now, and was not carried down to its resting-place by rivers, or transported thither by accident. Of course, small quantities of coal may have been formed by these delta deposits; but it seems hardly likely that the eighty distinct beds which may be recognised in the South Wales coal-field, for example, could have been produced in such an adventitious manner. The time that must have been required for the deposition of our coal-measures quite transcends our powers of imagination. Every separate seam of coal meant a depression of the earth where it grew beneath the water-level, for the rocks which cover it are sedimentary. Then, after a long interval, measured perhaps by tens of thousands of years, it was again raised above the surface, and a fresh forest gradually grew up; to be, after long ages, again submerged, and so on, until the whole series of fireclays, coal-seams, shales, sandstones, and iron ores were piled one above the other, hundreds of feet deep.

The well-known club-moss or *Lycopodium* is, like the peat-forming sphagnum, propagated by spores instead of seeds. Ferns also reproduce

themselves in the same way, and on the back of a fern frond in early summer, small green, generally kidney-shaped, bodies may be easily recognised. They are really small sacs—the 'sporangia,' which later on become filled with large numbers of little brown granules, the spores. The *lycopodium* spores are somewhat similar, and are produced by the plant in enormous quantities. They are highly resinous, and were formerly used in the theatre to produce mimic lightning, as, when they are blown through a spirit-flame, a vivid flash is caused; and in night-signalling they take the place of the heliograph. In examining thin sections of coal under the microscope, Professor Morris discovered numbers of yellowish sac-like bodies, which were at once identified as sporangia; and enclosed in them, and disseminated through the surrounding matrix, were quantities of small granules, which are no doubt the spores themselves. Although they bear such an exact resemblance to the fruit of the *lycopodium*, they did not grow on an insignificant plant two or three feet from the ground, but on a mighty forest tree, the *Lepidodendron*, towering up a hundred feet high, the remains of which occur abundantly in the coal-measures, and have sometimes been found with the cover in which the spore-cases are actually preserved, still attached to their branches. In spite of their difference in height, the resemblance between the shape of their stems and spores and spore-cases is so striking, that it seems impossible to doubt that the old forest giant which flourished perhaps hundreds of thousands of years ago was nothing but a magnified edition of the lowly club-moss. As with the peat, so with the coal; the softer portion gradually mouldered away, leaving only the hard woody tree stems and waterproof resinous spores; and Professor W. Boyd Dawkins says: 'No doubt, the bituminous matter of coal is almost all derived from the spores and sporangia of fossil vegetation allied to the club-moss. Our bituminous coal derives its bitumen from this altered resinous matter, first stored up in the fruits (spores, &c.), and afterwards more or less altered by subterranean heat into bitumen.'

Now, as regards the Japanese coal, Professor Watson Smith found it to contain no less than ten per cent. of bitumen or resinoids. The highest he was able to extract even from cannel coal was only a little over one per cent. This ten per cent. is therefore an enormous proportion, and marks out the Miike coal as a very remarkable one indeed. As might be expected, it is an excellent coal for gas-making, giving over 11,000 cubic feet of 23·4 candle-power gas per ton. When a splinter of it is placed in the flame, it catches fire and flares like a torch of pinewood. Now Dr Percy has shown that the ashes of a coal closely resemble the fireclay of the contiguous seams in which it grew. The ash of Miike coal contains a large proportion of lime, showing that the vegetation from which it was derived flourished in a chalky soil. Judging from this, its investigator considers it likely that, the soil being favourable to their growth, the trees from which the coal was derived must have been of an unusually resinous character.

A large quantity of this bitumen was extracted and fractionally distilled—that is, the heat was kept constant at a particular temperature until

nothing more distilled over, and then raised fifty degrees, and kept there until the renewed distillation again ceased; and so on. The first fraction smelt exactly like benzoline or petroleum naphtha; the next fraction when refined bore the unmistakable odour of petroleum lamp oil; and the next on cooling deposited paraffin scale abundantly; and the oil drained off was very similar to the lubricating oils obtained from American petroleum. Thus we see the reason for the dense volumes of black smoke which are given off when it is thrown on the furnace fire.

The question at once arises: could this petroleum-like substance formed in the coal have any bearing on the origin of petroleum? Professor Watson Smith replies that here we have a coal with the petroleum in it, which can be distilled off at a moderately high temperature. Supposing the Miike coal uniform throughout, there is distributed through it at this present moment no fewer than 8,544,000 tons of bitumen, capable of yielding some 1,800,000 tons of thick petroleum oil, and 427,000 tons of solid paraffin wax. If this were contained in porous sandstone, like the Pennsylvanian deposits, instead of being still left in the coal, we should certainly call it a most important reservoir of petroleum.

The next step the investigator proposes to take is to distil off the oil from a considerable quantity of the coal and see what the residual coal is like. Probably a residue resembling anthracite, a kind of coal converted almost into coke by natural agencies, will be left behind. In Pennsylvania and Eastern Ohio, where petroleum is found in such large quantities, it occurs uniformly saturating heavy beds of porous sandstone. This sandstone is overlaid by an impervious roof of slate, that holds down both the oil and the gas in the rock below under great pressure. The sandstone rests on an immense formation of shale, over one thousand feet thick, containing large quantities of animal and vegetable remains. Contiguous to these strata, although now separated by a branch of the Alleghanies which may have been upheaved more recently than the deposits, are vast beds of anthracite coal, which form by far the most important coal-field in America. The five separate beds cover an area amounting to four hundred and thirty-four square miles, and the coal-measures range from two to three thousand feet in depth. The average thickness of the actual coal-seams is at least seventy feet, and they reach a maximum of two hundred and seven feet. Is it not possible that the oil was once embosomed in this anthracite, as it is now in the Japanese coal? And, being driven out by subterranean heat, was absorbed by the neighbouring sandstone in the same way that, in the laboratory, the condenser imprisoned the vapours distilling over from the retort? Tar and oil springs are of frequent occurrence in our own country, although the production is insignificant. Here, there is no doubt that they originated in the coal.

Petroleum occurs widely distributed in various geological formations, and it is not contended that the above is the only way in which it may have originated. In fact, the shale described as underlying the petroleum deposits is a mass of fossil organisms, both animal and vegetable, of which it contains such quantities, that Dr J. S. Newbery

has suggested that the Silurian ocean from which it was deposited must have been a veritable Sargasso Sea. M. Zoloziecki has put forward a theory of paraffin formation from animal matter. Petroleum, indeed, has been obtained from animal substances at a great heat and high pressure. Under suitable conditions, too, it can be produced from fish-oil; and the Old Red Sandstone and other rocks, we know, teem with fossilised fish; but there are certain chemical considerations derived from the actual composition of mineral oil which, whilst throwing doubt upon all these hypotheses, do not render them altogether untenable. So that, although these other sources may have contributed, it seems more probable that the main origin was a carbonaceous one, especially since turpentine has been discovered in petroleum residues.

Thus, to sum up, we see that, to account for these deposits, we must carry our thoughts back to the time when the earth was covered with a dense bath of warm vapour, through which no ray of the sun could penetrate, as the surface of the planet Saturn is now; and in imagination, watch the vast forests of *Lepidodendrons*, tree ferns, *sigillarias*, and other flowerless giants scattering their showers of innumerable yellow resinous spores and cones, for century after century, on the marshy ground below; these in turn being covered with water and compressed beneath beds of sedimentary rock to form bituminous coal, which, perhaps ages after, was distilled by volcanic heat, and yielded the hidden store of oil and gas which well up in such enormous quantities from the sandstone of Pennsylvania and Ohio.

BLOOD ROYAL.

CHAPTER IV.—A ROYAL POURPARLER.

NEXT morning, when Richard went down to his work in town, Mr Wells, his employer, accosted him at once with the unwelcome greeting: 'Hullo, Plantagenet, so I hear you're going up to college at Oxford!'

Nothing on earth could well have been more unpleasant for poor Dick. He saw at once from Mr Wells's tone that his father must have bragged: he must have spoken of the projected trip at the *White Horse* last night, not as a mere speculative journey in search of a problematical and uncertain Scholarship, but as a *fait accompli*, a domestic arrangement dependent on the mere will of the house of Plantagenet. However, we must all answer for the sins of our fathers: there was nothing for it now but to brazen it out as best he might; so Dick at once confided to his master the true state of the case, explaining that he would only want a few days' holiday, during which he engaged to supply an efficient substitute; that his going to Oxford permanently must depend on his success in the Scholarship examination; and that even if he succeeded, which he modestly judged unlikely, he wouldn't need to give up his present engagement and go into residence at the university till October.

These explanations, frankly given with manly candour, had the good effect of visibly mollifying Mr Wells's nascent and half-unspoken resentment. Richard had noticed just at first that he assumed

a sarcastic and somewhat aggrieved tone, as one who might have expected to be the first person informed of this intended new departure. But as soon as all was satisfactorily cleared up, the bookseller's manner changed immediately, and he displayed instead a genuine interest in the success of the great undertaking. To say the truth, Mr Wells was not a little proud of his unique assistant. He regarded him with respect, not unminged with pity. All Chiddingwick, indeed, took a certain compassionate interest in the Plantagenet family. They were, so to speak, public property and local celebrities. Lady Agatha Moore herself, the wife of the Squire, and an Earl's daughter, always asked Mrs Plantagenet to her annual garden-party. Chiddingwickians pointed out the head of the house to strangers, and observed with pardonable possessive pride: 'That's our poor old dancing-master; he's a Plantagenet born, and some people say if it hadn't been for those unfortunate Wars of the Roses, he'd have been king of England. But now he holds classes at the *White Horse* Assembly Rooms.' Much more then, had, Mr Wells special reason to be proud of his own personal relations with the heir of the house, the final inheritor of so much shadowy and hypothetical splendour. The moment he learned the real nature of Dick Plantagenet's errand, he was kindness itself to his clever assistant. He desired to give Dick every indulgence in his power. Mind the shop? No, certainly not! Richard would want all his time now to cram for the examination. He must cram, cram, cram: there was nothing like cramming!

During the four days that remained before the trip to Oxford, Mr Wells wouldn't hear of Richard's doing any more work in the shop than was absolutely necessary. He must spend all his time, the good man said, in reading Hume and Smollett—the latest historical authorities of whom the Chiddingwick bookseller had any personal knowledge. Dick availed himself for the most part of his employer's kindness; but there was one piece of work, he said, which he couldn't neglect, no matter what happened. It was a certain book-binding job of no very great import—just a couple of volumes to cover in half-calf for the governess at the rectory. Yet he insisted upon doing it. Somehow, though he had only seen Mary Tudor once, for those few minutes in the shop, he attached a very singular and sentimental importance to binding that book for her. She was a pretty girl, for one thing, an extremely pretty girl, and he admired her intensely; but that wasn't all; she was a Tudor as well, and he was a Plantagenet. In some vague half-conscious way he reflected more than once that 'it had gone with a Tudor, and with a Tudor it might come back again.' What he meant by that *It* he hardly knew himself: certainly not the crown of this United Kingdom; for Dick was far too good a student of constitutional history not to be thoroughly aware that the crown of England itself was elective, not hereditary; and he had far too much common sense to suppose for one moment that the people of these three realms would desire to disturb the Act of Settlement and repeal the Union in order to place a local dancing-master or a bookseller's assistant on the throne of England.

The days wore away; Stubbs and Freeman were well thumbed: the two books for Mary Tudor were bound in the daintiest fashion known to Chiddingwickian art: and on the morning of the eventful Wednesday itself, when he was first to try his fate at Oxford, Dick took them up in person, neatly wrapped in white tissue paper, to the door of the rectory.

Half-way up the garden path, Mary met him by accident. She was walking in the grounds with one of the younger children; and Dick, whose quick imagination had built up already a curious castle in the air, felt half shocked to find that a future queen of England, Wales, and Ireland (*de jure*) should be set to take care of the rector's babies. However, he forgot his indignation, when Mary, recognising him, advanced with a pleasant smile—her smile was always considered the prettiest thing about her—and said in a tone as if addressed to an equal: 'Oh, you've brought back my books, have you? That's punctuality itself. Don't mind taking them to the door.—How much are they, please? I'll pay at once for them.'

Now, this was a trifle disconcerting to Dick, who had reasons of his own for not wishing her to open the parcel before him. Still, as there was no way out of it, he answered in a somewhat shamefaced and embarrassed voice: 'It comes to three-and-sixpence.'

Mary had opened the packet meanwhile and glanced hastily at the covers. She saw in a second that the bookseller's lad had exceeded her instructions. For the books were bound in full calf, very dainty and delicate, and on the front cover of each was stamped in excellent workmanship—a Tudor rose, with the initials *M. T.* intertwined in a neat little monogram beneath it. She looked at them for a moment with blank dismay in her eye, thinking just at first what a lot he must be going to charge her for it; then, as he named the price, a flush of shame rose of a sudden to her soft round cheek. 'Oh, no,' she said hurriedly. 'It *must* be more than that. You couldn't possibly bind them so for only three-and-sixpence!'

'Yes, I did,' Dick answered, now as crimson as herself. 'You'll find the bill inside. Mr Wells wrote it out. There's no error at all. You'll see it's what I tell you.'

Mary fingered her well-worn purse with uncertain fingers. 'Surely,' she said again, 'you've done it all in calf. Mr Wells can't have known exactly how you were doing it.'

This put a Plantagenet at once upon his mettle. 'Certainly he did,' Dick answered, almost haughtily. 'It was a remnant of calf, no use for anything else, that I just made fit by designing those corners. He said I could use it up if I cared to take the trouble. And I *did* care to take the trouble, and to cut a block for the rose, and to put on the monogram, which was all my own business, in my own overtime. Three-and-sixpence is the amount it's entered in the books for.'

Mary gazed hard at him in doubt. She scarcely knew what to do. She felt by pure instinct he was too much of a gentleman to insult him by offering him money for what had obviously been a labour of love to him; and yet, for her own part, she didn't like to receive those hand-

some covers to some extent as a present from a perfect stranger, and especially from a man in his peculiar position. Still, what else could she do? The books were her own; she couldn't refuse them now, merely because he chose to put a Tudor rose upon them—all the more as they contained those little marginal notes of 'localities' and 'finds' which even the amateur botanist prizes in his heart above all printed records; and she couldn't bear to ask this grave and dignified young man to take the volumes back, remove the covers on which he had evidently spent so much pains and thought, and replace them by three-and-sixpence worth of plain cloth, unlettered. In the end she was constrained to say frigidly, in a lowered voice: 'They're extremely pretty. It was good of you to take so much trouble about an old book like this. There's the money, thank you:—and—I'm greatly obliged to you.'

The words stuck in her throat. She said them almost necessarily with some little stiffness. And as she spoke, she looked down, and dug her parasol into the gravel of the path for nervousness. But Richard Plantagenet's pride was far deeper than her own. He took the money frankly; that was Mr Wells's; then he answered in that lordly voice he had inherited from his father: 'I'm glad you like the design; it's not quite original: I copied it myself with a few variations from the cover of a book that once belonged to Margaret Tudor. Her initials and yours are the same. But I see you think I oughtn't to have done it. I'm sorry for that: yet I had some excuse. I thought a Plantagenet might venture to take a little more pains than usual over a book for a Tudor. *Noblesse oblige.*' And as he spoke, standing a yard or two off her, with an air of stately dignity, he lifted his hat, and then moved slowly off down the path to the gate again.

Mary didn't know why, but with one of those impulsive fits which often come over sympathetic women, she ran hastily after him. 'I beg your pardon,' she said, catching him up, and looking into his face with her own as flushed as his. 'I'm afraid I've hurt you. I'm sure I didn't mean to. It was very, very kind of you to design and print that monogram so nicely. I understand your reasons, and I'm immensely obliged. It's a beautiful design: I shall be proud to possess it.'

As for Richard, he dared hardly raise his eyes to meet hers, they were so full of tears. This rebuff was very hard on him. But the tell-tale moisture didn't quite escape Mary. 'Thank you,' he said simply. 'I—I meant no rudeness; very much the contrary. The coincidence interested me; it made me wish to do the thing for you as well as I could. I'm sorry if I was obtrusive. But—one sometimes forgets—or perhaps remembers. It's good of you to speak so kindly.' And he raised his hat once more, and, walking rapidly off without another word, disappeared down the road in the direction of the High Street.

As soon as he was gone, Mary went back into the rectory. Mrs Tradescant, the rector's wife, was standing in the hall. Mary reflected at once that the little girl had listened open-eared to all this queer colloquy, and that to prevent misapprehension, the best thing she could do would be to report it all herself before the child could

speak of it. So she told the whole story of the strange young man who had insisted on binding her poor dog-eared old botany-book in such regal fashion. Mrs Tradescant glanced at it and only smiled. 'Oh, my dear, you mustn't mind him,' she said. 'He's one of those crazy Plantagenets. They're a very queer lot; as mad as hatters. The poor old father's a drunken old wretch, come down in the world, they say: he teaches dancing; but his mania is that he ought by rights to be king of England. He never says so openly, you know: he's too cunning for that: but in a covert sort of way, he lays tacit claim to it. The son's a very well conducted young man in his own rank, I believe, but as cracked as the father; and as for the daughter, oh, my dear—such a stuck-up sort of girl, with a feather in her hat, and a bee in her bonnet, who goes out and gives music lessons! It's dreadful, really. She plays the violin rather nicely, I hear; but she's an odious creature.—The books? Oh, yes, that's just the sort of thing Dick Plantagenet would love. He's mad on antiquity. If he saw on the title-page your name was Mary Tudor, he'd accept you at once as a remote cousin, and he'd claim acquaintance offhand by a royal monogram. The rose is not bad. But the best thing you can do is to take no further notice of him.'

A little later that very same morning, however, Richard Plantagenet, mad or sane, was speeding away across country—in a parliamentary train—towards Reading and Oxford, decided in his own mind now about two separate plans he had deeply at heart. The first one was, that, for the honour of the Plantagenets, he mustn't fail to get that Scholarship at Durham College: the second was, that, when he came back with it to Chiddingwick, he must make Mary Tudor understand he was at least a gentleman. He was rather less in love with her, to be sure, after this second meeting, than he had been after the first; but still, he liked her immensely, and in spite of her coldness, was somehow attracted towards her; and he couldn't bear to think a mere Welsh Tudor, not even really royal, should feel herself degraded by receiving a gift of a daintily bound book from the hands of the Heir Apparent of the true and only Plantagenets.

CHAPTER V.—GOOD SOCIETY.

Dick knew nothing of Oxford, and would hardly even have guessed where in the town to locate himself while the examination was going on, had not his old head-master at Chiddingwick grammar-school supplied him with the address of a small hotel, much frequented by studious and economical young men on similar errands. Hither, then, he repaired, Gladstone bag in hand, and engaged a modest second-floor room; after which, with much trepidation, he sallied forth at once in his best black suit to call in due form on the Reverend the Dean at Durham College.

By the door of the *Saracen's Head*, which was the old-fashioned name of his old-fashioned hostelry, two young men—mere overgrown school-boys of the Oxford pattern—lounged, chatting and chaffing together, as if bent on some small matter of insignificant importance. Each swung a light cane, and each looked and talked as if the town were his freehold. One was a fellow in a

loose gray tweed suit and a broad-brimmed slouch-hat of affectedly large and poetical pretensions; the other was a faster-looking and bolder young person, yet more quietly clad in a black cut-away coat and a billycock hat, to which commonplace afternoon costume of the English gentleman he nevertheless managed to give a touch of distinctly rowdy and rapid character. As Dick passed them on the steps, to go forth into the street, the young man in black observed oracularly, 'Lamb ten to the slaughter;' to which his companion answered with brisk good-humour in the self-same dialect, 'Lamb ten it is; these meadows pullulate: we shall have a full field of them.'

By a burst of inspiration, Dick somehow surveyed them that they were referring to the field for the Durham Scholarships, and that they knew of ten candidates at least in the place who were also going in for them. He didn't much care for the looks of his two fellow-competitors, for such he judged them to be; but the mere natural loneliness of a sensitive young man in such strange conditions somehow prompted him almost against his will to accost them. 'I beg your pardon,' he said timidly, in a rather soft voice, 'but I—that is to say—could you either of you tell me which is the nearest way to Durham College?'

The lad in the gray tweed suit laughed and surveyed him from head to foot with a somewhat supercilious glance as he answered with a curious self-assertive swagger: 'You're going to call on the Dean, I suppose. Well, so are we. Durham it is. If you want to know the way, you can come along with us.'

Companionship in misery is dear to the unsophisticated human soul; and Richard, in spite of all his father's lessons in deportment, shrank so profoundly from this initial ordeal of the introductory visit, that he was really grateful to the supercilious youth in the broad-brimmed hat for his condescending offer. Though, to be sure, if it came to that, nobody in England had a right to be either supercilious or condescending to a scion of the Plantagenets.

'Thank you,' he said, a little nervously. 'This is my first visit to Oxford, and I don't know my way about. But I suppose you're not in for the Scholarship yourself?' And he gazed half unconsciously at his new acquaintance's gray tweed suit and big sombrero, which were certainly somewhat noisy for a formal visit.

The young man in the billycock interpreted the glance aright, and answered it promptly. 'Oh, you don't know my friend,' he said with a twinkle in his eye, and a jerk of the head towards the lad in gray tweed; 'this is Gillingham of Rugby—otherwise known as the Born Poet. England expects every man to do his duty; but she never expects Gillingham to dress or behave like the rest of us poor common everyday mortals. And quite right, too. What's the good of being a Born Poet, I should like to know, if you've got to mind your Ps and Qs just like other people?'

'Well, I'm certainly glad I'm not an Other Person,' Gillingham responded calmly, with a nonchalant air of acknowledged superiority. 'Other People for the most part are so profoundly uninteresting! But if you're going to walk with

us, let me complete the introduction my friend has begun. This is Faussett of Rugby, otherwise known as the Born Philistine. Congenitally incapable of the faintest tincture of Culture himself, he regards the possession of that alien attribute by others as simply ridiculous.' Gillingham waved his hand vaguely towards the horizon in general. 'Disregard what he says,' he went on, 'as unworthy a serious person's intelligent consideration, and dismiss him to that limbo where he finds himself most at home, among the rowdy mob of all the Gaths and Askelons!'

Dick hardly knew how to comport himself in such unwonted company. Gillingham's manner was unlike anything else to which he had ever been accustomed. But he felt dimly aware that politeness compelled him to give his own name in return for the others'; so he faltered out somewhat feebly, 'My name's Plantagenet,' and then relapsed into a timid silence.

'Whew! How's that for a name?' Gillingham exclaimed, taken aback. 'Rather high, Tom, isn't it?—Are you any relation to the late family, so called, who were kings of England?'

This was a point-blank question which Dick could hardly avoid; but he got over the thin ice warily by answering with a smile: 'I never heard of more than one family of Plantagenets in England.'

'Eton, of course?' Gillingham suggested with a languid look. 'It must be Eton. It was founded by an ancestor.'

To Dick himself, the question of the Plantagenet pedigree was too sacred for a jest; but he saw the only way to treat the matter in the present company was by joking; so he answered with a little laugh: 'I believe there's no provision there for the founder's kin, so I didn't benefit by it. I come only from a very small country grammar-school—Chiddingwick, in Surrey.'

'Chiddingwick! Chiddingwick! Never knew there was such a place,' Gillingham put in with crushing emphasis. And he said it with an air which showed at once so insignificant a school was wholly unworthy a Born Poet's attention.

As for the Philistine, he laughed. 'Well, which are you going in for?' he asked, with a careless swing of his cane: 'The science, or the classics?'

'Neither,' Dick answered. 'My line's modern history.'

With a sudden little start, Gillingham seemed to wake up to interest. 'So's mine,' he put in, looking extremely wise. 'It's the one subject now taught at our existing universities that a creature with a soul—immortal or otherwise—would be justified in bothering his head about for one moment. Classics and mathematics! oh, fiddlesticks! shade of Shelley, my gorge rises at them!'

'You won't have any chance against Gillingham, though,' Faussett interposed with profound conviction. 'He's a fearful dab at history! You never knew such a howler. He's read pretty well everything that's ever been written in it from the earliest ages to the present time. Herodotus and York Powell alike at his fingertips! We consider at Rugby that a man's got to get up uncommon early if he wants to take a rise out of Trevor Gillingham.'

'I'm sorry for that,' Dick answered quite earnestly, astonished, now he stood face to face with these men of the world, at his own presumption in venturing even to try his luck against them. 'For I can't have many shots at Scholarships myself; and unless I get one, I can't afford to come up at all to the university.' His very pride made him confess this much to his new friends at once, for he didn't wish to seem as if he made their acquaintance under false pretences.

'Oh, for my part, I don't care twopence about the coin,' Gillingham replied with lordly indifference, cocking his hat yet a trifle more one-sidedly than ever. 'Only, the commoner's gown, you know, is such an inartistic monstrosity! I couldn't bear to wear it! And if one goes to a college at all, one likes to feel one goes on the very best possible footing, as a member of the foundation, and not as a mere outsider, admitted on sufferance.'

Dick followed him, trembling, into the large paved quad, and up the stone steps of the Dean's staircase, and quivered visibly to Faussett's naked eye as they were all three ushered into the great man's presence. The room was panelled, after Clarence's own heart: severe engravings from early Italian masters alone relieved the monotony of its old wooden wainscots.

A servant announced their names. The Dean, a precise-looking person in most clerical dress, seated at a little oak table all littered with papers, turned listlessly round in his swinging chair to receive them. 'Mr Gillingham of Rugby,' he said, focussing his eye-glass on the credentials of respectability which the Born Poet presented to him. 'Oh, yes, that's all right. Sixth Form—h'm, h'm: Your head-master was so kind as to write to me about you. I'm very glad to see you at Durham, I'm sure, Mr Gillingham: hope we may number you among ourselves before long. I've had the pleasure of meeting your father once—I think it was at Athens. Or no, the Piræus. Sir Bernard was good enough to use his influence in securing me an escort from the Greek Government for my explorations in Boeotia. Country very much disturbed: soldiers absolutely necessary.—These papers are quite satisfactory, of course; h'm, h'm: highly satisfactory. Your Head tells me you write verses, too. Well, well, we shall see. You'll go in for the Newdigate. The Keats of the future!'

'We call him the Born Poet at Rugby, sir,' Faussett put in, somewhat mischievously.

'And you're going in for the modern history examination?' the Dean said, smiling, but otherwise not heeding the cheeky interruption. 'Well, history will be flattered.' He readjusted his eye-glass.—'Mr Faussett; Rugby too, I believe? H'm, h'm; well, your credentials are respectable, decidedly respectable—though by no means brilliant. You've a brother at Christ Church, I understand; ah, yes, exactly. You take up classics. Quite so.—And now for you, sir; let me see;' he dropped his eyeglass, and stared hard at the letter Richard laid before him: 'Mr—er—Plantagenet of—what is it?—oh, I see, Chiddingwick grammar-school.—Chiddingwick, Chiddingwick? H'm? h'm? never heard of it. Eh? What's that? In Yorkshire, is it? Oh, ah, in Surrey; exactly; quite so. You're a candidate for the History

Scholarship, it seems. Well, the name Plantagenet's not unknown in history. That'll do, Mr Plantagenet; you can go. Good-morning. Examination begins in hall to-morrow at ten o'clock punctually.—Mr Gillingham, will you and your friend lunch with me on Friday at half-past one?—No engagement? Most fortunate.' And with a glance at the papers still scattered about his desk, he dismissed them silently.

Dick slunk down the steps with a more oppressive consciousness of his own utter nothingness in the scheme of things, than he had ever before in his life experienced. He strolled with his two chance acquaintances down the beautiful High Street, and into the gardens at Magdalen, very heavy in heart at their dire predictions. The cloisters themselves failed to bring him comfort. He felt himself foredoomed already to a disastrous fiasco. So many places and things he had only read about in books, this brilliant, easy-going, very grown-up Trevor Gillingham had seen and mixed in and made himself a part of. He had pervaded the Continent. The more Gillingham talked, indeed, the more Dick's heart sank. Why, the man knew well every historical site and building in Britain or out of it! History to him was not an old almanac, but an affair of real life. Paris, Brussels, Rome—Bath, Lincoln, Holyrood—he had known and seen them! Dick longed to go back and hide his own discomfited head once more in the congenial obscurity of dear sleepy old Chiddingwick.

But how could he ever go back without that boasted Scholarship? How cover his defeat after Mr Plantagenet's foolish talk at the *White Horse*? How face his fellow-townsmen—and Mary Tudor? For very shame's sake, he felt, he must brazen it out now, and do the best he knew—for the honour of the family.

SOME NEW INDIAN INSECT PESTS.

THE progress of scientific research is constantly leading to the discovery of new enemies to mankind. Fortunately, where science finds the bane, it also seeks to discover the antidote, although it is not always immediately successful. What Miss Ormerod is doing for England in her campaign against our insect enemies, Dr Cotes of the Indian Museum in Calcutta is striving to do against the legions of tiny insects in India that devour the valuable products of the earth and make vain the labour of the husbandman. In former times the vague name of 'blight' was given to every sort of flying insect or creeping pest that attacked the growing crops. Now, science with its microscope comes forward and examines the specific character of each sort of blight in whatever novel or unpleasant form it has presented itself. The philosopher, in his chamber of experiments, seeks to instruct his fellow-men whence and why the new plague has come, and how it may be mitigated or averted.

Every one in England has now become familiar with Indian tea. It is only about forty years ago that the cultivation of the tea-plant for commercial purposes was commenced in India. The enterprising men who established tea-gardens by clearing away the forests and underwood on the hills and by draining malarious swamps, found

that they had to contend with many unforeseen difficulties. Fever and ague, and sometimes cholera, seemed to haunt the new clearances. The tea-bushes that gave promise of an abundant crop were attacked by the paddle-cricket and slugs, and a peculiar form of red spider. These are now regarded as old enemies. But within the last two or three years a new assailant has appeared: it is in the form of a small four-winged mosquito, so small that it can hardly be distinguished without a microscope. But it has come in such myriads, that in one tea-garden of about five hundred acres it is calculated that a loss of above a thousand pounds sterling has been incurred in one year owing to the ravages of these almost invisible foes. Hitherto, these mosquitoes have appeared only in a comparatively limited locality; but if they were to descend simultaneously on all the tea-gardens in India, the imagination fails to form any approximate calculation of the infinite number of these tiny creatures that would be brought into existence. The questions arise, Where do they come from? Where have they been living for centuries unknown and innocuous to man? Why have they set their affections on the tea-plant? How do they propagate their species? And how can they be annihilated? All these scientific problems Dr Cotes is endeavouring to solve.

Another unexpected enemy, a common hairy caterpillar, has turned its attention to the tea-gardens. This caterpillar was previously known and disliked in other parts of India; for any person who imprudently laid hands on it found the long hairs sticking to his fingers and producing most irritating blisters. If a hair got into a man's eye, it set up an inflammation that sometimes ended in blindness. When a horde of these hairy caterpillars unexpectedly invaded a tea-garden in Assam one morning, the effects were most disastrous to the native labourers, or coolies, whose naked legs and feet came in contact with them. The women and the children who are employed in plucking the shoots and leaves of the tea-plants soon found their hands and arms stinging with pain, from the hairs of the caterpillars that they had fearlessly but imprudently handled. Before the morning's work could be finished, sixty of the men, women, and children were obliged to go to the medical officer for relief, with their hands or feet blistered and suppurating. There was no apparent cause to explain why these caterpillars had suddenly come out of the neighbouring jungle to prey upon the tea-plants; but it is to be feared that if they once acquire a taste and preference for tea-leaves, the tea-planter will have a new enemy to reckon with, and the cost of tea will eventually be enhanced to the human consumer. It is said by some authorities that the caterpillars have increased out of due proportion because the wild birds that used to feed on them have been reduced in number, as the native labourers on the gardens are given to the pursuit of birds, and ruthlessly destroy their eggs and the young birds in their nests. But this is hardly a sufficient explanation.

In two very distant parts of India, Assam and Ceylon, it is reported that the rice-crops have been simultaneously attacked by an insect to which the name of the rice-sapper has been given. It

is about the size of a common house-fly, but more like the Indian flying green bug. It sucks out the soft grain of the young rice, leaving the empty husk to come to maturity. In due time the husbandman sees the rice-stalks bending apparently under the weight of the ears of grain, but he will reap nothing but a crop of these rice-sappers. In Burma the growing rice-crops have been much injured by a new kind of butterfly; whilst in the Central Provinces of India a novel sort of white moth is found to have set its affections on the young rice-plants. It is almost impossible to say from what quarter these new enemies have come, but it is to be feared that science will be much puzzled how to deal with them.

In the North-west Provinces of India, the peach-trees have recently been attacked by a multitude of two-winged flies. Hitherto, the peach-trees had been believed to be exempt from any special enemies, although in the stone of an over-ripe peach it was always prudent to look for a lurking earwig or a juvenile centipede. In the province of Assam efforts have been made to breed the once wild tussah silkworms. Large plantations of castor-oil plants were kept up, as its leaves are the favourite food of the tussah silkworms. In August, last year, a strange tribe of caterpillars came in millions out of the neighbouring jungle, and devoured all the leaves of the castor-oil plants, so that when the tussah silkworms were hatched out there was no food for them, and they died. How is science to contend with the invasions of these unexpected enemies?

Those who deal in wheat and other Indian grains know that they have always been preyed upon by weevils; but now three new different kinds of weevil have been discovered infesting the crops of wheat and gram. The culture of vines has been in recent years introduced in the hills of the Punjab with some fair promise of success; but it is reported that the grapes have been attacked by a small two-winged fly, which deposits its larve in the skin of the grape. In the sal forests of Central India it is said that the leaves of the trees were destroyed over a tract of two hundred square miles by a novel sort of caterpillar. Although this is rather a large order on our credulity, there is some satisfaction in learning that these caterpillars were in their turn hunted and preyed upon by two kinds of large flies, which found the body of the caterpillar a suitable place for the deposit of their eggs. Unfortunately, these avenging flies are not sufficiently discriminating in their tastes, and are as capable of depositing their eggs in the caterpillar of the useful tussah silk-moth as they are of employing the sal leaf-destroying caterpillar for the same purpose.

If we turn from the enemies already enumerated, we come to an insect that works in rather a different Indian field, but is now finding its way to England. Bot-flies are indeed already well known in England, but they are to be included among Indian pests, for the hides shipped from the principal Indian ports are found to be riddled with their holes, and depreciated accordingly for the purposes of the leather-trade. Next in order are certain small beetles that attack specimens of natural history, such as the

skins of animals and birds. But it is almost impossible to enumerate exhaustively all the tiny enemies that exist in India, to the detriment of the crops and of many other things that are useful for the purposes of man. Probably India itself is not more prolific of such pests than Africa and the other tropical regions of the globe; and the inhabitants of the colder climates may think themselves fortunate that they have as yet escaped from the threatened ravages of the Colorado beetle and other famous American bugs.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXVII.—LE CONSEIL DE FAMILLE.

'CHECKLEY,' said Mr Dering on Monday morning, 'here is a note from Miss Elsie Arundel. She makes an appointment with me at four o'clock this afternoon. Keep me free for that hour. Her brother Athelstan is coming with her.—What's the matter, man?'

'It's coming, then. I knew it would come.' Checkley groaned. 'It's all over at last.'

'What is all over?'

'Everything. But don't you believe it. Tell 'em it's a lie made up to screen themselves. They can't prove it. Nobody can prove it. I'll back you up. Only don't you believe it. Mind—it is a lie—a made-up lie.'

'I don't know what has been the matter with you for the last day or two, Checkley. What am I not to believe? What is a lie? Who is making up a lie which cannot be proved?'

'Oh! I can't say the word—I can't. It's all over at last—at last.' He ran out of the room and slammed the door behind him.

'My dear mother'—Hilda drove to Pembroke Square directly after breakfast—'I have had a most curious letter from Elsie. What does it mean? She orders—she does not invite—she positively orders—Sir Samuel—actually orders Sir Samuel!—and myself to attend at Mr Dering's office at four. We are ordered to assist, she says, at the demolition of the structure we have so carefully erected.—What structure? What does she mean? Here is the letter.'

'I too, dear, have had a letter from her. She says that at four o'clock this afternoon all the wrongful and injurious suspicions will be cleared away, and that if I value the affection of my son and herself—the affection of herself—I must be present.—Hilda, what does this mean? I am very much troubled about the letter. On Saturday, she came here and informed me that the wedding would be held on Wednesday just as if nothing had happened; and she foretold that we should all be present, and that Athelstan would give her away—Athelstan. It is a very disquieting letter, because, my dear, do you think we could all of us—could we possibly be wrong, have been wrong from the very beginning—in Athelstan's case? Could Sir Samuel be wrong in George's case?'

'My dear mother, it is impossible. The case, unhappily, is too clear to admit of any doubt.

Sir Samuel with his long experience could not be wrong.'

'Then, Hilda dear, what can Elsie mean?'

'We have been talking about it all through breakfast. The only conclusion we can come to is, that there is going to be a smothering up of the whole business. Mr Dering, who has been terribly put out with the case, must have consented to smother up the matter. We think that the papers have been returned with the money received on dividends and coupons; and that Mr Dering has agreed to take no further proceedings. Now, if he would do that, Athelstan of course would come under the Act of Indemnity; and as the notes were never used by him, but were returned to their owner, it becomes as easy to recognise his innocence as that of the other man.—Do you see?'

'Yes. But that will not make them innocent.'

'Certainly not. But it makes all the difference in the world. Oh! there are families everywhere who have had to smother up things in order to escape a scandal. Well, I hope you will agree with us, and accept the invitation.'

'I suppose I must.—But how about removing all the suspicions?'

'Oh! that is only Elsie's enthusiastic way. She will go on, if she likes, believing that George had nothing to do with it. He will have every inducement to live honestly for the future. We can easily pretend to believe that Athelstan was always innocent, and we can persuade him—at least I hope we can persuade him—to go abroad. Sir Samuel kindly says that he will advance a hundred pounds in order to get rid of him. Then there will be no scandal, and everybody will be satisfied. As for our relations with Elsie and her husband, we can arrange them afterwards. Perhaps they will agree to live in a distant suburb—say Redhill, or Chislehurst, or Walthamstow—so that there may be a good excuse for never having them to the house. Because—smothering or no smothering—I can no longer have the same feelings towards Elsie as before. Her obstinate infatuation for that man exasperates me only to think of it. Nor have I the least intention of being on intimate relations with a forger who has only just escaped being a convict. Sir Samuel entirely agrees with me.'

The mother sighed. 'I could have wished that we were mistaken. Perhaps, after all, there may be something that Elsie has found out, some unexpected'—

'Say a miracle at once, my dear mother. It is just as likely to happen.'

The first to arrive at the office in the afternoon was Elsie herself, carrying a handbag.

'You were going to bring your brother, Elsie,' said Mr Dering. 'Where is he? And what is your important business with me? I suppose it is something about this wretched forgery, which really seems destined to finish me off. I have heard of nothing else—I think of nothing else—ever since it happened.'

'First, has anything new been discovered?'

'I hardly know,' Mr Dering replied wearily. 'They seem to have found the man Edmund Gray; but Checkley has suddenly cooled. Formerly, he clamoured perpetually that we must lose no time in getting a warrant for his arrest;

* Copyright 1892 in the United States of America by Harper & Brothers.

he now wants to put it off and put it off. He was going on very strangely this morning. My dear, I sometimes think that my old clerk is off his head.'

'And you yourself—have you had any return of your forgetfulness?'

'Worse—worse.—Every day, worse. I now know when to look for a return of these fits. Every morning I ask myself what I did the day before. Always there are the same hours of forgetfulness—the morning and the evening. Last night, where was I? Perhaps somebody will find out for me—for I cannot remember.'

'Shall I find out for you, Mr Dering? If I were to tell you where you spent the evening yesterday, would you—would you?'

'What? How can you find out?'

Elsie bent her head. The moment had almost arrived, and she was afraid. She had come with the intention of clearing her brother and her lover at the cost of letting her guardian know that he was insane. A dreadful price to pay for their honour. But it had to be paid. And it must be done in the sight of all, so that there should be no possible margin left for malignity or suspicion.

'This business,' she said, 'concerns the honour of the two men who are dearer to me than all the world beside. Remember that—nothing short of that would make me do what I have been doing—what I am now doing. Their honour—oh! their honour. Think what it means to them. Self-respect, dignity, everything: the happiness of their homes: the pride of their children. Compared with one man's honour, what matters another man's humiliation? What matters the loss of that man's self-respect? What matters his loss of dignity? Their honour, Mr Dering, think of that—their honour!'

He bowed his head gravely, wondering what was to follow.

'A man's honour, as you say, Elsie, is the greatest thing in the world to him. Compared with that, another man's self-respect need not, I should say, as a general principle, be considered at all. Self-respect may be regained unless honour is lost.'

'Remember that, then, Mr Dering, when you hear what I have to say. Promise me to remember that. Oh! if there were a thousand reasons, formerly, why I would not pain you by a single word, there are ten thousand now—although you understand them not.'

'Why, Elsie, you are troubling your little head about trifles. You will not offend me whatever you say.'

'It is so important a thing,' she went on, 'that I have asked my mother and sister and Sir Samuel to meet us here at four o'clock, in order that they, too, may hear as well as you. Athelstan is with George. They have one or two persons to introduce to you.'

'All this seems to promise a meeting of some interest, and so far as one may judge from the preamble, of more than common importance. Well, Elsie, I am quite in your hands. If you and your brother between you will kindly produce the forger and give me back my property, I shall be truly grateful.'

'You shall see, Mr Dering. But as for the gratitude— Oh! here is Sir Samuel.'

The City knight appeared, large and important. He shook hands with Elsie and his brother, and took up his position on the hearthrug, behind his brother's chair. 'Well, Elsie,' he said, 'we are to hear something very important indeed, if one may judge by the tone of your letter, which was imperative.'

'Very important indeed, Sir Samuel.'

The next to arrive were Mrs Arundel and Hilda. They wore thick veils, and Hilda was dressed in a kind of half-mourning. They took chairs at the open window, between the historic safe and the equally historic small table. Lastly, George and Athelstan walked in. They received no greetings.

Mr Dering rose. 'Athelstan,' he said, 'it is eight years since you left us.' He held out his hand.

'Presently, Mr Dering,' said Athelstan. He looked round the room. His mother trembled, dropped her head, and put her handkerchief to her eyes, but said nothing. His sister looked out of window. Sir Samuel took no notice of him at all. Athelstan took a chair—the clients' chair—and placed it so as to have his mother and sister at the side. He wasn't therefore compelled to look at them across the table. He sat down, and remained in silence and motionless.

The Court was now complete. Mr Dering sat in his chair before his table, expectant, judicial. Sir Samuel stood behind him. Mrs Arundel and Hilda, the two ladies, sat at the open window. Elsie stood opposite to Mr Dering, on the other side of the table, her handbag before her. She looked like Counsel about to open the case for plaintiff. Athelstan—or plaintiff—naturally occupied the clients' chair on Mr Dering's left; and George, as naturally—the other plaintiff—stood behind him.

'Now, Elsie, if you please,' Mr Dering began.

'I shall want your clerk, Checkley, to be present, if you please.'

Mr Dering touched his bell. The clerk appeared. He stood before them like a criminal, pale and trembling. He looked at his master appealingly. His hands hung beside him. Yet not a word of accusation had been brought against him.

'Lord! man alive!' cried Sir Samuel, 'what on earth has come over you?'

Checkley shook his head sadly, but made no reply.

'I want to ask you a question or two, Checkley,' said Elsie, quietly. 'You have told Mr Dering—you have told Sir Samuel—that you saw my brother furtively put a parcel—presumably the stolen notes—into the safe at the very moment when you were charging him with forgery. Now, consider. That was a very serious thing to say. It was a direct statement of fact. Before, the charge rested on suspicion alone; but this is fact. Consider carefully. You may have been mistaken. Any of us may make a mistake.'

'It was true—Gospel truth—I see him place a parcel—edging along sideways—in the safe. The parcel we found afterwards in the safe containing all the notes.' The words were confident; but the manner was halting.

'Very well. Next, you told Sir Samuel that my brother had been living in some low suburb

of London with profligate companions, and that he had been even going about in rags and tatters.'

'Yes, I did. I told Sir Samuel what I heard. Mr Carstone told me. You'd better ask him. I only told what I heard.'

George went out, and returned, bringing with him Mr Freddy Carstone. He looked round the room and stared with surprise at Mr Dering, but said nothing. He had been warned to say nothing, except in answer to questions.

'Now, Mr Carstone,' Elsie asked him, 'how long is it since you met my brother after his return to England?'

'About three weeks ago I met him. It was in Holborn. I invited him into the *Salutation Tavern*.'

'Did you tell Mr Checkley here anything about his way of living?'

'I remember saying, foolishly, that he looked too respectable to have come from America; and I said in joke that I believed he had been in Camberwell all the time.'

'Nothing about profligacy?'

'Nothing at all.'

'Nothing about rags and tatters?'

'Certainly not. In fact, I knew nothing at all about Athelstan's life during the eight years that he has been away.'

'Have you anything to say, Checkley? You still stick to the parcel story, do you? Very well; and to the Camberwell and profligacy story?'

Checkley made no answer.

'Now, then. There is another question. You made a great point about certain imitations of Mr Dering's writing found in a drawer of Athelstan's table?'

'Well, they were there, in your brother's hand.'

'George, you have something to say on this point.'

'Only this. I was not long articulated at that time. The table was taken from the room in which I sat, and placed here for some special work. Now, the imitations of Mr Dering's handwriting were made by myself and another clerk in joke. I remember them perfectly. They were written at the back of a letter addressed to me.'

Mr Dering went to the safe and produced the bundle containing all the papers in the case. He unrolled the bundle and placed the contents on the table.

Everybody was now serious. Lady Dering looked out of the window no longer. Mrs Arundel had drawn her chair to the table.

Elsie picked out the paper containing the imitations. 'Tell me,' she said, 'if you remember—mind—everybody—this bundle of papers has never been shown to George—tell me the name of your correspondent.'

'It was Leonard Henryson.'

She gave the paper to Mr Dering. 'You see,' she said.

The lawyer gave it to his brother, who passed it on to his wife, who gave it to her mother. Mrs Arundel laid it on the table and raised her veil.

'The next point,' said Elsie, 'is about Athelstan's whereabouts during the last eight years.'

One letter was received by you, Mr Dering, four years ago. You have already shown it to me. Will you let me read this letter aloud for all to hear? It was in the bundle with the stopped notes. He bowed assent—and she read it.

'Twelve thousand pounds!' cried Sir Samuel—'twelve thousand pounds! All he had! Good Heavens!'

'All he had in the world,' said Elsie. 'And all for a child who refused to believe that her brother could be a villain! All he had in the world!' Her eyes filled with tears—but she dashed them aside and went on. 'He was in the States four years ago. That, I suppose, will no longer be denied. The next question is—when did he return to this country?'

George left the room again, and returned with a young gentleman.

'This gentleman,' Elsie continued, 'comes from Messrs Chenery & Sons, bankers, of New York and London. He has brought a letter with him. Will you kindly let me see it, sir?—It is,' she explained, 'a letter of credit brought over by my brother from California. You see the date—June 20th of this year.'

Mr Dering read it, and gave it to his brother, who gave it to his wife, as before.

'It says that Mr Athelstan Arundel, one of the staff of a certain Californian paper, will leave New York on June the 21st by the *Shannon*, and that he is authorised to draw on Messrs Chenery & Sons for so much.—Thank you.' The young gentleman retired.

'Now, Mr Dering, are you satisfied that Athelstan was in America four years ago—that he left America two months ago, and that he was then on the staff of a Californian paper?'

'There seems no reason to doubt these facts.—But'—he put his forefinger on the cheque payable to the order of Edmund Gray—'are we any nearer to the forger of this cheque?'

'I am coming to that presently. I am going to show you all, so that there shall be no doubt whatever, who is the forger—the one hand—in the business. Wait a little.'

Strangely enough, every eye fell upon Checkley, who now trembled and shook with every sign of terror.

'Sit down, Checkley,' said his master.—'Elsie, do we want this gentleman any longer? His name I have not the pleasure of knowing.'

'Oh! come,' said Mr Carstone, who was nearest. 'You know my name, surely.'

George warned him with a look, and he subsided into silence.

'I think I shall want you, Mr Carstone,' Elsie replied, 'if you will kindly take a chair and wait.—Now, Sir Samuel, I think I am right in saying that your belief in the guilt of George rested entirely on the supposed complicity of Athelstan. That gone, what becomes of your charge? Also, there is no doubt, I believe, that one hand, and one hand alone, has committed the whole long list of letters and forgeries. If, therefore, Athelstan could not execute the second business, how could he do the first? But I have more than arguments for you.'

Sir Samuel coughed. Mrs Arundel sighed.

'As regards the charge against George, apart from his supposed intimacy with an imaginary criminal, the only suspicious thing is that he

may have had access to the open safe. Well, Checkley also may have had access.—Don't be afraid, Checkley—we are not going to charge you with the thing at all. You are not the forger. In fact, there was a third person who had access to the safe.'

She opened her handbag and took out a packet of papers.

Then she sat down, with these in her hand, and leaning over the table, she looked straight and full into Mr Dering's eyes, and began to talk slowly in a low and murmuring voice. And now, indeed, everybody understood that something very serious indeed was going to be said and done. At the last moment a way had occurred to Elsie. She would let them all see for themselves what had happened, and she would spare her guardian the bitter shame and pain of being exposed in the presence of all this company.

'Mr Dering,' she began, 'you have strangely forgotten that you know Mr Edmund Gray. How could you come to forget that? Why, it is ten years at least since you made his acquaintance. He knows you very well. He does not pretend to have forgotten you. You are his solicitor. You have the management of his property—his large private fortune—in your hands. You are his most intimate friend. It is not well to forget old friends, is it? You must not say that you forget Edmund Gray.'

Mr Dering changed colour. His eyes expressed bewilderment. He made no reply.

'You know that Edmund Gray leaves this room every evening on his way to Gray's Inn: you remember that. And that he comes here every morning, but not till eleven or twelve—two hours after the time that you yourself used to come. His head is always so full of his thoughts and his teaching, that he forgets the time between twelve and four, just as you forget the evening and the morning. You are both so much absorbed that you cannot remember each other.'

Mr Dering sat upright, the tips of his fingers touching. He listened at first gravely—though anxiously. Presently a remarkable change passed over his face: he became full of anxiety. He listened as if he was trying to remember: as if he was trying to understand.

'Edmund Gray,' he said, speaking slowly. 'Yes, I remember my client Edmund Gray. I have a letter to write for him. What is it? Excuse me a moment; I must write that note for him.' He took pen and paper and hastily wrote a note, which Elsie took from him, read, and gave to Sir Samuel.

'You want to tell the banker that Mr Edmund Gray has returned you the transfers.—Yes—Thank you. I thought you could not forget that client, of all others.'

He leaned back smiling—his expression no longer anxious, but pleased and happy. The change transformed him. He was not Mr Dering, but another.

'Go on, child.'

'The rooms of Gray's Inn are quiet all day long. It is a peaceful place for study, is it not? You sit there, your books before you, the world forgotten.'

'Quite forgotten,' said Mr Dering.

'No—no,' cried Checkley, springing to his feet. 'I won't have it done. I'—

'Sit down.' George pushed him back into his chair. 'Another word, and you leave the room.'

ABOUT MISERS.

FEW people are able to realise to themselves the all-absorbing passion for hoarding which engrosses, to the exclusion of all others, the heart of the Miser. Curiously enough, this craving for secret wealth is a product of civilisation, which has grown up with society, and become more developed as gold and silver became emblems of wealth. The occupation and ambition of a miser's life is not to accumulate for himself or his children or relations, but for the same reason that a magpie steals a silver spoon, for the pleasure of hiding it.

Daniel Dancer was one of the class of misers who hoarded money for the pleasure of secreting it. In this he but followed an hereditary tendency, as his father and grandfather had all done the same. It has been said that miserly instincts as a general rule are not inherited, but this case was undoubtedly an exception; for not only himself but his brothers and sisters were all of a miserly disposition. He was born in the beginning of the eighteenth century at Weald, a village near Harrow, and on the death of his father, Daniel, the eldest son, inherited a fair estate. He suffered great uneasiness at this time on account of a feeling of certainty which possessed him that his father had concealed large sums of money about the premises. His trouble was not occasioned so much by the idea that the money might not be discovered, but from the fear that his brothers might find it and not give it to him. Ultimately, about two hundred pounds in gold and silver coins were discovered enclosed in two pewter dishes buried beneath a gate-post, and nothing more was ever found.

Dancer spent the whole of his life in the house on Harrow Weald Common, and a dreary, wretched blank that life was. The house stood in about eighty acres of rich meadow-land, with some fine oak-trees upon it; and there was also a small farm adjoining. The whole, if properly cultivated, might at that time have brought a nice little income. But cultivation is expensive, so he preferred to let everything run to grass. The house was never repaired, and gradually fell into sad decay. The gates on the premises were all off their hinges, and the hedges were allowed to grow until they became useless. He also practised a rigid economy upon his own person. He seldom washed his hands and face, and when he did, dispensed with the luxury of either soap or towel. His tattered clothes, of which the original colours were unrecognisable, were held together by means of a hayband wound round his body, his legs being encased in a similar covering. A more forlorn or wretched looking object it would be impossible to imagine; and yet at this time he was in possession of property of the annual value of three thousand pounds.

As he at this time lived alone, being too penurious to allow himself help of any kind,

his dwelling offered a temptation to robbery that was not likely to be resisted. His well-known avarice was an excuse, and seemed also a palliation for the crime. On several occasions thieves broke into the house, and once or twice he was nearly hanged in the endeavour to extort from him a confession where he had hidden his money. At length he securely nailed up all the doors and windows of his house, save one on the upper floor, which he entered by means of a ladder, dragging it in after him like Robinson Crusoe.

As no man is wholly bad, so this miserable miser had one good quality. Lady Tempest, his nearest neighbour, pitied the man, and had been kind to him, visiting him when he was ill, and endeavouring to persuade him to allow himself a few of the necessities of life. Not succeeding in getting him to abandon the sack in which he had slept for years, she actually presented him with a bed. In gratitude for her kindness, he made a will in her favour, and one day, when he thought he was dying, he sent for her, and gave her the paper. Having thus yielded up all that was dear to him on earth, he soon sank, and died on September 4, 1794, aged seventy-eight, and was buried in the churchyard of his parish of Harrow. Apart from his besetting weakness—craze, call it what you will—he often exhibited strong common sense, and there is no doubt but for that weakness he would have been a reputable citizen and a credit to his family.

John Elwes is a name which has become proverbial in the annals of avarice. Born to great riches, he nevertheless developed a passion for accumulating wealth by denying himself common necessities to such a degree as to make his name famous. The career of John Elwes presents in many respects a marked contrast to that of Dancer, and furnishes an example of the terrible inconsistency of man. His father's name was Meggott, a brewer of Southwark, who died when the boy was about four years old; and it was to the principles instilled by his mother, and later, the advice and example of his uncle, that John Elwes probably owed the most marked traits in his character. Although her husband left her one hundred thousand pounds, it is said she starved herself to death. Her son was sent to Westminster School, where he remained some years, and became a good classical scholar. He inherited about two hundred and fifty thousand pounds from his uncle, Sir Harry Elwes, who was himself as penurious as his nephew afterwards became; and as his own fortune was of a similar amount, he was at this time a very rich man. For fifteen years before his uncle's death John Elwes was known in all the fashionable circles of the metropolis, his large fortune introducing him to the best society. His passion for play—a passion at that time rampant in society—was only exceeded by his avarice, and it was not until late in life that he entirely relinquished it. According to his own assertion, few played deeper or with more varying success. He once sat playing for two days and a night with the Duke of Northumberland, to whom he lost several thousands. Strange inconsistency! that while struggling to save sixpences and shillings, he could thus fritter away thousands of pounds. At this time he was his uncle's acknowledged heir, and used to visit him frequently at his seat in Suffolk. It

is said that, fearful that his uncle would think him wantonly extravagant if he appeared before him in his ordinary dress, he hired a room in a cottage near, where he used to call and change his clothes for a very mean-looking quiet suit.

On the death of his uncle, Elwes assumed his name and removed to Suffolk, where he began to keep foxhounds. He had always been a bold and fearless rider, and at this time his hunters were considered among the best in the country. This was the only time he ever was known to spend money on pleasure. Even then, everything was managed after the most frugal fashion. His huntsman milked the cows, prepared breakfast for himself and friends, then attended to the stables, donned his green coat, and led the hounds; and after a day's hunting, refreshed himself by rubbing down the horses, milking the cows again, and so forth. And yet his master often called him an idle dog, and said he wanted to be paid for doing nothing.

With the two large fortunes which he possessed, and the wretched way in which he lived, his whole expenses at this time not being more than three hundred pounds a year, riches poured in upon him in torrents. But as he never kept any accounts or trusted any one to keep them for him, relying on his memory for everything, his affairs were in a frightful tangle, of which no one could find the thread but himself, and he lost it as he advanced in years. He was a prey to every person who had a want or a scheme that promised high interest, and in this way is said to have lost one hundred and fifty thousand pounds.

He sat for Berkshire, in which he had a large estate, in three parliaments; but his parliamentary honours made no difference in his dress or his habits. He consented to stand for the constituency only upon condition that he should be returned free of expense. He dined once at the ordinary at Abingdon during his canvass, and so obtained his seat in parliament for the moderate sum of one shilling and sixpence, a record which has probably not yet been broken. Nevertheless, he was wont to declare that the seat cost him quite as much as three contested elections, in consequence of the borrowing propensities of the other members—loans that were never repaid. Probably that was one reason why he retired from parliament, as his constituents had a high opinion of his integrity, and would certainly have returned him at a small expense.

As Elwes grew in years, his parsimony increased. He took to building largely in London around Marylebone, and this entailed frequent visits to the metropolis. On these occasions it was his custom to occupy any house of his own that might happen to be empty. In this manner he moved about from street to street, so that his own relations never knew where to find him. A couple of beds, the same number of chairs, a table, and an old woman, comprised all the furniture, and he moved them about at a minute's warning. He used to say that of all his movables the old woman gave him the most trouble. She was always taking cold from the chillness of the large rooms, coupled with insufficient firing.

His son George having married, was naturally anxious that his father should make his home

with him. One obstacle advanced by the old man was the expense of the journey; this was overcome by the attorney employed by his son offering to take him to Berkshire free of cost. Next, he stated that his last coat was so shabby, and he could not afford to buy another. This objection was likewise overcome through the same agency, his son desiring Mr Partis, the attorney, to buy one and make him a present of it. He finally went to reside with his son on his estate in Berkshire; but his memory was beginning to fail him, and he was continually losing the small sum of money which he had taken with him, and which he declared was all he had in the world. It was about five pounds; and this he used to hide, and being unable to find it, declared that he had been robbed. At last, having become very feeble, and his memory quite gone, he died on the 26th of November 1788, leaving property to the amount of eight hundred thousand pounds. His two natural sons inherited half a million; and the remainder, consisting of entailed estates, descended to the heir-at-law.

This man was one of the strangest contradictions. He was of the highest honour and integrity, and his word alone was always considered a sufficient security. Though consumed and his better nature distorted by the passion of avarice, such was his delicacy of feeling that he professed never to be able to ask a gentleman for money, and this rule he never violated. In consequence, several large sums which in his gambling days he won from persons of rank were never paid. His manners were always gentlemanly and mild, even rudeness could not ruffle them; and on several occasions he was known to put himself to considerable trouble in order to do a service to persons from whom he could have had no hope of repayment. From all of which we may conclude that there was in him a natural kindness of heart, though choked by a rank growth of noxious weeds.

Of a totally different character was Thomas Cooke, who was a contemporary of Elwes, and who attained some little celebrity by his riches and shameless meannesses. He was born at Clewer, near Windsor, in 1726. His father, an itinerant fiddler, died when he was an infant, and he was brought up by a grandmother at Swannington, near Norwich. As a boy he was employed at a factory in Norwich, afterwards becoming a porter to a drysalter. Through the interest of his master, he obtained an appointment in the Excise, and arrived in London with eight shillings in his pocket. His early habits of parsimony continued. He ingratiated himself with a brewer, and took some trouble to learn the business; and when this man died, he told the widow her only chance of carrying on the trade was to marry himself, as he was better acquainted with it than any one else. To this she ultimately consented. He was now a rich man; but the richer he became, the more his avarice increased. He allowed scarcely any food in the house, nearly starved besides ill-treating his wife; and she, poor soul, who had been used to a very different life with her former husband, soon died of a broken heart. One of his favourite methods of obtaining his daily food was by timely visits to persons he knew, throwing out

hints of having just made his will, in which he had not forgotten them. Or he would be very particular in having the full names of the children written down, carefully bestowing the paper in his pocket-book. Another method was to fall down in the street in a simulated fit before a good house, into which he would be taken and kindly treated. He never failed to call the next day, profuse in his thanks for their kindness, representing that they had saved his life, for which some day they would receive a substantial reward. Thus, by empty promises made to all sorts of people, he was continually raising hopes for no other purpose than to trade on them to his own advantage. As the rich Mr Cooke's friendship was worth cultivating, he was continually receiving presents of geese, turkeys, hares, and wines, from people to whom he had made these false promises. Notwithstanding his inordinate love of money, he was fond of amusement; he liked a good horse, and went once a year to Epsom races. These excursions, however, seldom cost him anything, for he always managed to fasten himself upon other people. At length, through infirmities of age, he found himself compelled to have medical advice. His plan then was to dress himself in rags, and apply to some physician as a pauper or unfortunate tradesman, relying upon the doctor's kindness to obtain his advice. He did this many times, and once was so troublesome to a doctor, that the latter caused inquiries to be made about him, and discovered who he was. Upon this he refused to see him again, and sent him his bill, which, however, was never paid. Thus did this man, by the most paltry devices, delight in tricking every one with whom he was brought in contact. At length he became extremely weak, and spent the remaining portion of his life in arranging his affairs with his solicitor, altering and realtering his will many times. He died on the 26th of August 1811, in the eighty-sixth year of his age, unpitied and unlamented, leaving nearly one hundred and thirty thousand pounds behind him. Of all the miserable and sordid men of whose life we have any record, his, surely, is the worst. Not one good action or one redeeming virtue can we place to his credit.

THE AUSTRALIAN LARRIKIN.

He is a corner-boy; but he is more than that. He shuns honest work; but he is more than an idler. Like the mysterious growths in Australian fauna and flora, he seems to be a peculiar product of the country; and he has grown with the growth of population, until his present numbers, and his habits and methods of operation, have become an interference with the liberty of the well disposed, and his presence has become a nuisance. He is not illiterate. Not that, by any means. He can read, write, and cipher. The system of compulsory education has taught him the three Rs; but it has fallen short of teaching him to behave himself or to become a respectable member of society. Our Australian Larrikin has diverted his knowledge to vile uses, and turned into foul channels what might otherwise have helped him in a true life-career. He can be more ingeniously profane than the old country

corner-boy of fifty years ago; but he is in every respect a larrikin, and his education only seems to have assisted him in becoming a cleverer one.

In his moments of respite from his perverse war against society, he is a politician. He can talk glibly and familiarly of Sir John Robertson as 'old Johnny Robertson,' and knows all about Sir Henry Parkes from the days of his toy-shop till the present. In New South Wales he is a Protectionist, and reproaches the Free-trade policy of the Government for his want of employment; while in Victoria he rails against Protection as the occasion of all his woes, and he is there a thorough-going Free-trader. The new question of Federation he professes to understand in all its bearings, and on this, as on all like subjects, he speaks with the authority of one who knows.

But the prominent theme of his conversation and the charm of his life is Sport, and particularly that section of it known by him as horse-racing. He knows all the great horses of the past and the present; and ventures to give 'tips' as to all the future. He will undertake to enlighten you about the English Derby, and discourse eloquently regarding the prospects of Australian horses winning laurels there in days to come. The Melbourne Cup and the Randwick or Liverpool races are watched by him with the keenest interest, and by means fair or foul he raises money to place on the events.

Cricket has of course a large share of his attention. Intercolonial matches interest him only to a slight degree; but the arrival in the colonies of an English cricketing team is a red-letter day for him; and in an incredibly short space of time he is thoroughly versed in the outstanding characteristics of the play of every member in the team. And if you find him asserting that 'So-and-so' is a good wicket-keeper, and some one else the best bowler in the team, you have generally to admit that the judgment he has passed is correct.

The other form of athletics which aids in relieving our friend's life of care is sculling; and in recent times, perhaps the sculling contests more than cricket have added zest to his existence. This is naturally to be accounted for by the fact that the Australians have been the victors; and beyond all else, our larrikin is an Australian and a worshipper of muscle.

The foregoing is our larrikin in his milder moods. Unfortunately, there is a darker side. He does not always talk politics, or the turf, or athletics. The practice of cruelty forms one of his chief personal amusements. And this is not to be wondered at. It is only another phase of that disregard for feelings which prompts him to insult the human beings which pass him by at the street corners. The lower forms of creation should have no feelings; hence, on his Sundays, he and a few of his fellows may be seen proceeding to the bush on a hunting expedition—the ostensible game being rabbits, hares, native bears, kangaroos, wallabies, or aught of the like which may be started. If on the journey, however, anything should be encountered in the shape of young cattle, and if half a chance presents itself, the higher game, irrespective of its value, will be that destroyed. Only about twelve months ago the writer saw a

yearling heifer which had fallen into the merciless hands of a band of these ruffians; their dogs had been set on to worry it; and when the refined amusement ceased, the poor beast was almost powerless to move.

The Australian larrikin is a thief. He must have money; for he attends races and bets on them; he smokes and he drinks; and these things mean money. Nowadays, it does not often happen that fond and foolish parents will provide their grown-up and idle sons with means whereby to continue in that occupation. Life is becoming too much of a struggle in the colonies, as elsewhere, to admit of such; and if the larrikin is forced on his own resources, he is to be found pilfering from shop-entrances, clearing fowl-roosts, breaking and entering dwellings, and developing into a sneaking, contemptible thief.

Some of the plundering depredations of these youths have a ludicrous side. Not a great while ago two of them resolved to start poultry-farming in a little place in the vicinity of Sydney. The undertaking seemed a laudable one; and it was pleasing to hear of the enterprise of the lads embarking on the venture with the evident desire to turn over a new leaf and gain an honest livelihood. The poultry-run was prepared, and was gradually stocked; but unfortunately, about the same time numbers of people began complaining that their fowl-roosts had been visited by night and deprived of their occupants. The police got behind the scenes; the fowls were identified; the run was broken up, and the poultry-fanciers were provided with other quarters. Doubtless, during all the future lives of these two individuals there will be muttered cursing against the brutal colonial laws which place a block in the way of men earning their livelihood, merely because of some absurd notions about the rights of property.

Sometimes, too, there is considerable romance connected with the procedure of the larrikin. A year ago or so half-a-dozen of them formed themselves into a sort of joint-stock company, with the apparent intention of saving expense in the shape of rent. They took up their residence in a rocky seaside cavern, and were certainly accomplishing their object; but soon it was discovered that, as well as living rent free, they were managing at the same time to get together the necessities of life without troubling to pay for them. One of the partners in the concern was found to have eloped with a bag of flour from a grocery establishment; and others of them had succeeded in doing the like regarding many of the commodities necessary for the carrying on of a well-ordered and well-provided abode. But here, again, the police put an abrupt ending to the proceedings, and Nature's romantic residence by the sea was exchanged for one of artificial construction.

Were we, however, to enumerate all the delinquencies of the Australian larrikin, our survey would extend over all the items of the criminal calendar. Assaults on policemen, assaults on females, stabbing affrays, robberies from the person, and every conceivable form of offence, would be in the catalogue. All do not go the full length in blackguardism; but some, on the other hand, seem demon-possessed in their mad career; and for these there is nothing too daring,

nothing too desperate. Of such a character were the larrikins who, a few years ago, committed a foul and well-known atrocity, for which several of them suffered the extreme penalty of the law, and others are at present undergoing varied terms of imprisonment.

The ages of the individuals we have been describing range from the middle of the 'teens' to the middle of the 'twenties.' At the earlier age the youth is graduating in the school of vice under the instruction of the elder members of 'the talent.' At the latter he has become a confirmed frequenter of the jails; and drifts into the ranks of that section of the adult unemployed which lounges in the parks in the daytime, and, when not engaged in deeds of darkness, sleeps there at night.

There are larrikinesses also. These keep the company of the larrikins, and often assist them in their burglaries and other exploits. They frequent the dens of the Chinamen in the cities, and the huts of the Chinese gardeners in the suburbs and the country; and they do so, some of them, when they have hardly entered their 'teens.' Some months ago, in Sydney, a member of this class was ordered to be imprisoned for three months, for 'having no lawful, visible means of support.' She was eighteen years of age, and had been in the habit of living for some weeks at a time in the den of one Chinaman, and then removing to another, and so on. She said 'she would not work while she could be supported by Chinamen, and that she liked Chinamen better than other people.' One of the Celestials came forward to say that 'he would mallee [marry] her by-and-by;' but the magistrate had heard such speech before, and passed sentence.

Reasons innumerable have been given for this state of things in connection with youthful Australia. Some have said that where exceptional wildness is encountered, the transgressors will be found to be the descendants of the earliest of all the white settlers in Australia—those who 'left their country for their country's good,' and who, in entering upon colonial life, had a stained record to start with. Some, again, declare that a large proportion of the larrikin class are the posterity of those who, being far from a success at home, were despatched by fond parents to Australia, with bright visions indulged 'to gild the far land where their homes were to be,' visions of future reformation, and of the new men the new country would make. The hopes were illusive, and such settlers turned out no more of an Australian success than an English one; and it is not unreasonable for some to suppose that their offspring have inherited their evil propensities. Others, again, lay a large part of the blame at the door of parents, and affirm that there is an almost general want of parental control sadly noticeable in the Australian colonies, which has already caused much mischief, and augurs badly for the future. The free, open-air life which colonial children lead allows them to be much less under the direct parental care than is the case in the old lands; and an independence of action tends to be developed, which, if not guided to proper aims, soon finds out improper ones. No efficient, directing power is vouchsafed, so some are found to say, and the

natural result of the want of restraint on the part of parents has led on the part of children to a want of regard not only for parental law, but for all law, and for constituted authority.

It is probable that all of these reasons have something to do with the point at issue. Certain it is that the last-mentioned one has had confirmation in a speech by the Honourable J. H. Carruthers, Minister of Education for New South Wales. Speaking to a gathering of school children, he said: 'It was a regrettable fact that during the year 1889 there had been more than one thousand convictions recorded of juvenile offenders for stealing and destroying plants and flowers in the Sydney Botanic Gardens; while in other parts of the world there could be grown around the grounds of gentlemen plants and flowers and fruits unfenced and unmolested. He deplored the evident want of respect for property which was manifested by the growing boys and girls of Australia, and hoped for better things.'

We have sketched the evil. What will cure it all? The question is easy to ask; but it is a simpler task to tell of the facts and give reasons for them than to point out the remedy. The authorities by convicting on the charge, 'No lawful, visible means of support,' rid society for a short time of the presence of both male and female members of 'the craft;' but it is only a brief respite, and does not cure. He would be a public benefactor who would devise effective means for converting into a useful and respectable member of society the Australian larrikin of to-day.

AN AUTUMN MELODY.

WHAT notes of what ditty can sound from the city,
From out of the dust and the din,
Where the sun's pallid taper is dim through the
vapour

That shrouds all the sorrow and sin?
At evening I listen—the murky lamps glisten,
The stars peer by two and by three;
The harsh Babel-noises replace your sweet voices,
Dear sea!

Yet past the fog-curtain, I know it for certain,
The barn-roofs have caught the last ray;
The smoke of the threshing is softly enmeshing
Brown gables with delicate gray;
The red leaves are falling, the plovers are calling,
The sea-wind is salt o'er the wold;
The bryonies blacken, the tufts of green bracken
Turn gold.

O scents that redouble where slow through the
stubble
The plough cleaves a pathway of hope!
O woods fading yellow, and orchards grown mellow,
And flocks on the far-away slope!
O sea-songs that mingle on boulder and shingle,
O fields that of old-time I knew!
My heart swells to bursting with infinite thirsting
For you!

BRITISH REGIMENTS AND THEIR INSIGNIA.

THE time-honoured badges and other devices borne by our British Regiments can boast in many instances of a very interesting origin. This is not only true with regard to the 'white horse,' 'laurel wreath,' or 'castle and key,' which we are accustomed to see set down in almanacs and the like as the badges of certain corps, for there are frequently other distinguishing features that find no place in such lists. These are sometimes of a kind, too, not well calculated to attract the notice of non-military persons; and it is possibly within the mark to say that not one in twenty civilian observers detects, for example, the apparently meaningless bow of ribbon on the back of the collars of the Royal Welsh Fusiliers. This much-prized decoration is a unique distinction, without, however, any very heroic history; it is merely a memento of the queue or pigtail which was worn in the army till about 1808.

Among other badges, the same regiment carries the not unusual one of the 'white horse,' above alluded to. Though well enough known, no doubt, to be the 'white horse of Hanover,' it is probably not so widely understood for what reason this device came to be bestowed upon so many of our older regiments. It would appear that in the beginning of the last century the appointments of a good many corps displayed the armorial coat or crest of the colonel-in-chief, who was often a member of the aristocracy, and a territorial magnate in some part of the country. Such marks of distinction on the part of these territorial families, we are told, excited the keen jealousy of the newly-arrived Hanoverians, so much so, that one of the very first steps taken by George I. was to sweep away these family insignia and replace them with his own. Hence, then, the frequency of the white horse as a regimental device.

A regiment of great renown, the Scots Greys, carry as a badge an eagle with outstretched wings—the only device of the kind in the army.

The Greys have enjoyed this unique distinction since the celebrated capture of a French eagle or standard at Waterloo by Sergeant Ewart, who was given a commission for his gallantry. It is a well-earned badge, too, for the Greys have a sort of pre-eminence for taking standards: at Ramillies they captured the colours of the 'Régiment du Roi;' while at Dettingen they took the famous white standard of the French household cavalry. And they are well entitled to the motto 'Second to none,' which they proudly carry. The mention of this motto reminds us that there is another of the kind, though in Latin, in the 'Service:' the Coldstream Guards carry the words 'Nulli Secundus' upon their regimental colour. When the troops were paraded to take the oath of allegiance to Charles II. after the Restoration, the men were ordered to 'ground' their arms. Among others present were the three regiments since known as the Foot-guards; and they were commanded to take up arms as the First, Second, and Third Guards. The First and Third obeyed with alacrity; the regiment of General Monk stood still, to the surprise of the king, who inquired of Monk the reason for their insubordinate bearing. The veteran replied that his regiment declined to be considered second to any other; and, says the legend, Charles remarked: 'Very well; they shall be my Coldstream Regiment of Foot-guards, and second to none.' Hence the motto. General Monk's connection with this corps is commemorated in a curious manner. A small Union Jack is borne on the Queen's Colour of the Coldstream, in consequence of Monk having been an Admiral of the fleet as well as a general. This is a distinction without a parallel in the army.

Almost every one must notice that while officers wear their sashes over the left shoulder, sergeants have theirs over the right. There is one exception, however, to this rule; for the sergeants of the 29th Foot arrange their sashes in precisely the same manner as the officers. Some say that this distinction dates from Culloden, where the regiment is alleged to have had so

many officers slain, that sergeants had to take their places in command of the companies. Another regiment, the 13th, commemorates its terrible loss on the same field in a different fashion: the officers wear perennial mourning in the shape of a black stripe in their gold lace. This kind of perpetual mourning is not, however, peculiar to the 13th. The 65th and 84th have black-edged lace on the officers' tunics, in memory, it is said, of the loss they sustained on the Nive in 1813; and black gloves used to be worn by the 84th to commemorate the same event. Some other corps have the black stripe in their gold lace, but it seems to be very doubtful for what reasons. In certain cases it is supposed to be a symbol of mourning for General Wolfe or Sir John Moore; in others, for heavy losses in action.

At Dettingen, in 1743, the 22d Foot extricated George II. from a somewhat perilous position, in remembrance of which event they wear a small sprig of oak in their caps on the Queen's birthday and other special occasions; and on the 29th of May an acorn is worn by some old regiments, that date being the anniversary of the Restoration. In a similar fashion the 12th and 20th wear a rose on the 1st of August. This floral decoration arises from the tradition, which is well founded, that at Minden these regiments marched through flower-gardens, and most of the men wore roses as they went into action on August 1, 1759. For their prowess at Minden, the 12th, 20th, 23d, 25th, 37th, and 51st regiments were granted leave to carry a laurel wreath on their colours and equipments; and for reasons above alluded to, the 20th have in addition a rose on their standards. Besides the 'Minden wreath,' there is one other instance of the same symbol in the army—it is borne on the colours of the 57th, the 'Die Hards' of Albuera celebrity. A regiment just mentioned, the 12th, together with the 39th, 56th, and 58th, carry the 'Castle and Key,' the motto 'Montis insignia Calpe,' and the word 'Gibraltar,' on account of having taken part in the memorable defence of that fortress from 1779 to 1783.

A famous regiment, the 5th or Northumberland Fusiliers, has a distinction of a curious if not altogether unprecedented variety. In their head-dress the officers and men have a plume red in the upper moiety and white in the lower; and though this may not perhaps seem a matter of much moment, it has a history. At Wilhelmstahl, and again when in St Lucia, the 5th, after sanguinary combats, gathered from the caps of slain French grenadiers enough white feathers to fit out the whole regiment with plumes—an adornment which a while afterwards met with the approval of the authorities. But in 1829 a War Office order gave instructions for the white plume to be more generally adopted in the service; and in consequence of this innovation, the Fusiliers complained that they would lose their well-earned distinction. So the matter at issue was eventually compromised by granting them permission to wear the half-red, half-white plume above mentioned. For reasons never properly explained, the 5th wear a rose on St George's Day.

Besides feathers, other curious trophies are represented in the belongings of this regiment.

At Lucknow they captured an ivory bedstead belonging to the Begum, as well as a great rod or stick of silver. From a part of the former a bandmaster's baton was carved; while the latter was fashioned into a drum-major's staff. Both are still doing duty. This staff, by the way, reminds us of the ivory stick carried on the anniversaries of certain battles by the sergeant-major of the 91st Highlanders. When on the way home from the Cape in 1802, the transport having the regiment on board was charged by a sword-fish, which left its weapon embedded in the side of the vessel. Converted into a walking-stick, the ivory sword accompanied the sergeant-major through the whole of the Peninsular War. The names of the battles in which it was carried are inscribed upon it on plates of solid gold; and it is still carried on parade by the sergeant-major on the anniversaries of these actions.

Somewhat akin to the party-coloured plume of the Northumberland Fusiliers, again, was the red ball which used to appear on the shakoes of the light company of the 46th Foot. During the battle of Brandywine, in the American War, this company by accurate shooting made great havoc in the ranks of the enemy, who threatened, when they could obtain a favourable opportunity for revenge, to give the marksmen no quarter. In defiance, however, of this menace, and to make themselves more readily distinguished from their comrades, they dyed the ball in their caps red—with blood, according to tradition—in place of the green worn by the rest of the regiment. This distinction was subsequently sanctioned by the War Office authorities.

One more instance of a similar kind, and we are done. The 28th Foot used to have a singular distinguishing feature in their number badge, which was affixed not only on the front, in the usual manner, but also on the *back* of their caps. On one occasion in Egypt, when rather incautiously drawn up in line, a fierce onslaught was made upon the regiment, in rear as well as in front, by large bodies of French cavalry. There was no time to get into square formation to 'receive' the charging horsemen; but the commanding officer, being a man of resource, shouted, 'Rear rank, right-about-face. Fire!' The men carried out the order with promptitude; standing back to back, they simultaneously beat off both assaults; and to commemorate the affair, they were granted the unique distinction of the duplicate number badge.

BLOOD ROYAL.

CHAPTER VI.—THE PROOF OF THE PUDDING.

DICK slept little that night: he lay awake, despondent. Next day he rose unrefreshed, and by a quarter to ten was in the quad at Durham. Not another candidate as yet had showed up so early. But undergraduates were astir, moving aimlessly across the quad in caps and gowns, and staring hard at the intruder, as one might stare at a strange wild beast from some distant country. Dick shrank nervously from their gaze, hardly daring to remember how he had hoped at Chiddingwick to be reckoned in their number. One

thing only gave him courage every time he raised his eyes—the Plantagenet Leopards on the façade of the buildings. Should he, the descendant of so many great kings—*atavis editus regibus*—should he slink ashamed from the sons of men whom his ancestors would have treated as rebellious subjects? He refused such degradation. For the honour of the Plantagenets he would still do his best; and more than his best, the Black Prince himself could never have accomplished.

He lounged around the quad till the doors of the hall were opened. A minute before that time, Gillingham strolled casually up in sombrero and gray suit and nodded a distant nod to him. 'Morning, Plantagenet,' he said languidly, putting his pipe in his pocket; and it was with an effort that Dick managed to answer as if unconcerned, 'Good-morning, Gillingham.'

The first paper was a stiff one—a feeler on general European history, to begin with. Dick glanced over it in haste, and saw to his alarm and horror a great many questions that seemed painfully unfamiliar. Who on earth were Jacopo Nardi, and Requesens, and Jean Rey? What was meant by the Publication of the Edict of Rostock? And he thought himself an historian! Pah! this was simply horrible! He glanced up mutely at the other candidates. One or two of them appeared every bit as ill at ease as himself; but others smiled satisfied; and as for the Born Poet, leaning back against the wall with pen poised in one hand, he surveyed the printed form with a pleased smirk on his face that said as plainly as words could say it, 'This paper was just made for me! If I'd chosen the questions myself, I couldn't have chosen anything that would have suited me better.' He set to work at it at once, with a business-like air—while Dick chewed his quill pen—evidently flooring every item in the lot consecutively. No picking and choosing for him; he dashed straight at it: Peter the Great or Charles XII, Cæsar Borgia or Robespierre, it was all one, Dick could see, to the Born Poet. He wrote away for dear life with equal promptitude on the Reformation in Germany and the Picts in Scotland; he seemed just as much at home with the Moors at Granada as with the Normans in Sicily: he never hesitated for a second over that fearful stumper, 'State what you know of the Rise and Progress of the Bavarian Monarchy;' and he splashed off three whole pages of crowded foolscap without turning a hair, in answer to the command, 'Describe succinctly the alterations effected in the Polish Constitution during the seventeenth Century.' Such encyclopædic knowledge appalled and alarmed poor Dick, with his narrower British outlook: he began to feel he had been ill-advised indeed to measure his own strength against the diplomatic service and the historical geniuses of the old foundations.

When they came out at midday, he compared notes on their respective performances with Gillingham. All three young men lunched together at the *Saracen's Head*—Dick ordering cold beef and a glass of water, for Mr Plantagenet's example had made him a teetotaler; while the two Rugby boys fared sumptuously every day off outlets, asparagus, fresh strawberries, and claret.

Gillingham had walked through the paper, he averred; a set of absurdly elementary questions. 'I floored Jacopo Nardi,' he remarked with a genial smile, 'and I simply polished off the Edict of Rostock.' Dick, more despondent, went through it in detail, confessing with shame to entire ignorance of more than one important matter. 'Oh, the Poet wins!' Faussett exclaimed, with deep admiration. 'He wins in a canter. I tell you, it's no use any other fellow going in, when the Poet's in the field. It's Gillingham first, and the rest nowhere. He knows his books, you see. He's a fearful pro. at them.'

'Perhaps there's a dark horse, though,' Gillingham suggested, smiling. 'The Prince of the Blood may hold the lists after all, against all comers.'

'Perhaps so,' Faussett answered with a short little laugh. 'But I'll back the Rugby lot against the field, all the same, for a fiver. The rest are rank outsiders. Even money on the Poet! Now gentlemen, now's your chance! the Poet for a fiver! even money on the Poet, the Poet wins; who'll back the Plantagenet?'

Dick coloured to the very roots of his hair; he felt himself beaten in the race beforehand. Oh, why had he ever come up to this glorious, impossible place at all? And why did he ever confide the secret of his intentions to the imprudent head of the house of Plantagenet?

That day and the next day, it was always the same. He sat, and bit his pen, and looked hard at the questions, and waited for inspiration that never seemed to come: while Gillingham, the brilliant, the omniscient, the practical, fully equipped at all points, went on and wrote—wrote, scratching his foolscap noisily with a hurrying pen, straight through the paper. Dick envied him his fluency, his readiness, his rapidity; the Born Poet kept his knowledge all packed for immediate use at the ends of his fingers, and seemed able to pour it forth on no matter what topic, the very instant he required it. Words came to him quick as thought: he never paused for a second. Before the end of the examination, Dick had long ago given up all for lost, and only went on writing at the papers at all from a dogged sense that it ill became a Plantagenet to admit he was beaten as long as a drop of blood or a whiff of breath remained in his body.

The three days of the examination passed slowly away, and each day Dick felt even more dissatisfied with his work than he had felt on the previous one. On the very last evening, he indited a despondent letter to Maud, so as to break the disappointment for her gently, explaining how unequally he was matched with this clever fellow Gillingham, whom all Rugby regarded with unanimous voice as a heaven-sent genius, a natural historian, and a Born Poet. After which, with many sighs, he betook himself once more for the twentieth time to the study of the questions he had answered worst, wondering how on earth he could ever have made that stupid blunder about Aidan and the Synod of Whitby, and what could have induced him to suppose for one second that Peter of Amboise was really the same person as Peter the Hermit. With these and other like errors he made his soul miserable that live-long night; and he worried himself with highly-coloured

mental pictures of the disgrace he would feel it to return to Chiddingwick, no Oxford man at all, but a bookseller's assistant!

Not till twelve o'clock next day was the result to be announced. Richard spent the morning listlessly with Gillingham and Faussett. The Born Poet was not boastful; he hated ostentation; but he let it be clearly felt he knew he had acquitted himself with distinguished credit. Poor Dick was miserable. He half reflected upon the desirability of returning at once to Chiddingwick, without waiting to hear the result of the examination; but the blood of the Plantagenets revolted within him against such a confession of abject cowardice. At twelve o'clock or a little after, he straggled round to Durham. In the big Chapel Quad, a crowd of eager competitors gathered thick in front of the notice-board. Dick hardly dared to press in among them and read in plain black and white the story of his own unqualified discomfiture. He held back and hesitated. Two elderly men in caps and gowns, whom he knew now by sight as fellows and tutors, were talking to one another quite loud by the gate. 'But we haven't seen Plantagenet yet,' the gravest of them said to his neighbour; he was a tall fair man, with a cultivated red beard and a most æsthetic *pince-nez*.

Dick's heart came up in his mouth. He stood forward diffidently. 'My name's Plantagenet,' he said, with a very white face. 'Did you want to speak to me?'

'Oh, yes,' the tutor answered, shaking him warmly by the hand: 'you must come up, you know, to enter your name on the books, and be introduced to the Warden.'

Dick trembled like a girl. His heart jumped within him. 'Why, what have I got?' he asked, hardly daring even to ask it, lest he should find himself mistaken.

The man with the red beard held out a duplicate copy of the paper on the notice-board. 'You can see for yourself,' he answered; and Dick looked at it much agitated.

'Modern History: Mr Richard Plantagenet, late of Chiddingwick Grammar-school, is elected to a Scholarship of the annual value of One Hundred Pounds. *Proxime accessit*, Mr Trevor Gillingham of Rugby School. Mr Gillingham is offered a set of rooms, rent free, in the College.'

The world reeled round and round on Dick as a pivot. It was too good to be true. He couldn't even now believe it. Of what happened next, he never had any clear or connected recollection. In some vague phantasmagoric fashion he was dimly aware of being taken by the tutor into the College Hall and introduced by name to a bland-looking effigy in a crimson gown, supposed to represent the Head of the College; after which it seemed to him that somebody made him sign a large book of statutes or something of the sort in mediæval Latin, wherein he described himself as 'Plantagenet, Ricardus, gen. fil., hujus ædis alumnus'; and that somebody else informed him in the same tongue he was duly elected. And then he bowed himself out in what Mr Plantagenet the elder would have considered a painfully inadequate manner, and disappeared with brimming eyes into the front quadrangle.

As yet he had scarcely begun to be faintly conscious of a vague sense of elation and triumph;

but as he reached the open air, which freshened and revived him, it occurred to him all at once that now he was really to all practical intents and purposes an Oxford undergraduate, one of those very people whose gorgeous striped blazers and lordly manners had of late so overawed him. Would he ever himself wear such noble neckties? Would he sport a straw hat with a party-coloured ribbon? He looked up at the big window of that beautiful chapel, with its flamboyant tracery, and felt forthwith a proprietary interest in it. By the door, Faussett was standing. As Dick passed, he looked up and recognised 'the dark horse,' the rank outsider. He came forward and took his hand, which he wrung with unfeigned admiration. 'By Jove, Plantagenet,' he cried, 'you've licked us; you've fairly licked us. It's wonderful, old man. I didn't think you'd have done it. The Poet's such an extraordinary dab, you know, at history. But you must be a dabber. Look here, I say, what a pity you didn't take me the other day when I offered even money on Trev. against the field. You simply chucked away a good chance of a fiver!'

A little farther on, Gillingham himself strolled up to them. His manner was pure gold. There was no trace of jealousy in the way he seized his unexpected rival's hand. To do him justice, indeed, that smallest and meanest of the human passions had no place at all in the Born Poet's nature. 'Well, I congratulate you,' he said with a passing pang of regret—for he too had wished not a little to get that Scholarship; 'as Sir Philip Sidney said, your need was the greater. And even for myself I'm not wholly dissatisfied. It's been a disappointment to me—and I don't very often secure the luxury of a disappointment. The true poet, you see, ought to have felt and known every human passion, good, bad, or indifferent. As pure experience, therefore, I'm not sorry you've licked me. It will enable me to throw myself henceforth more dramatically and realistically into the position of the vanquished, which is always the more pathetic, and therefore the more poetical.'

They parted a little farther down on the way towards the High Street. After they'd done so, the Philistine turned admiringly towards his schoolfellow, whom no loyal Rugby boy could for a moment believe to have been really beaten in fair fight by a creature from a place called Chiddingwick Grammar-school. 'By George, Trev,' he exclaimed with a glow of genuine admiration, 'I never saw anything like that! It was noble, it was splendid of you!'

The Born Poet hardly knew what his companion meant; but if it meant that he thought something which he, Trevor Gillingham, had done was noble and splendid, why, 'twas certainly not the Born Poet's cue to dispute the point with him. So he smiled a quiet non-committing sort of smile, and murmured in a gentle but distant voice, 'Aha? you think so?'

'Think so!' Faussett echoed. 'Why, of course I do: it's magnificent. Only—for the honour of the school, you know, Trev.—I really think you oughtn't to have done it. You ought to have tried your very best to lick him.'

And meanwhile, Dick Plantagenet himself, the real hero of the day, was straggling down, more dead than alive for joy, towards the Oxford post-

office, to send off the very first telegram he had ever despatched in his life: 'MISS MAUD PLANTAGENET, Chiddingwick, Surrey.—Hooray, have got it, the hundred pound history.' Thirteen words: sixpence ha'penny. Strike out the Maud, and it's the even sixpence.*

(To be continued.)

THE BANKERS' CLEARING-HOUSE.

Most people have heard of the Bankers' Clearing-house. It is situated in Post-office Court, which runs between Lombard and King William Streets, and is by no means prepossessing in appearance. Time was, no doubt, when it could boast of being as pleasing to the eye as most of its then neighbours; but *tempora mutantur*—and the Clearing-house has changed for the worse. The dirt of ages has clustered thick upon it; its architectural style has grown hopelessly old-fashioned; while lordly banking halls of granite and of Portland stone have risen and compassed it on every side. It formed, originally, part of the old Post-office, and was first put to its present use some hundred and ten years ago; but how long previous to its adaptation to the purposes of the City bankers its walls were set up the record does not inform us.

The portals of the House are so jealously guarded by a couple of door-keepers that no member of the general public is likely to have an opportunity of witnessing for himself the work conducted inside; and, therefore, the following particulars of the system, from the pen of one who has had considerable experience as a 'Clearer,' may not prove uninteresting.

Each of the twenty-five Clearing Bankers is allotted a desk, over which the name of the firm is displayed in prominent letters. These desks are arranged in alphabetical order, Barclay's being close to the left-hand side of the door, with Brown's, the City Bank, and others for near neighbours. That of the National Provincial is at the far end of the House; and the remaining banks follow in proper sequence until Williams', on the right-hand side of the door, is reached. The number of clerks representing each bank varies considerably; for while such houses as Glyn's and the London and County have as many as eight, a small bank like the London and South-western sends only one during the early portion of the work, and an extra hand about four o'clock, when the busiest time commences. On Stock Exchange 'Settling Days,' when stock-brokers' cheques pass in large numbers through the Clearing-house, and on the 4th of each month, on which day a great many bills fall due, most of the banks increase the number of their representatives, and on these occasions the desk accommodation is by no means sufficient. Some slight relief is afforded by pressing into the service a small room up-stairs; but the arrangement is found to be very inconvenient, and the staff will gladly welcome the day when the Committee of Bankers, in whose hands the management of the House is placed, decides to remove the business to some more commodious structure.

The staff consists of a 'Chief Inspector,' 'Deputy Inspector,' 'Clearers,' and 'Runners.'

The two inspectors carefully scrutinise each clearer's balance-sheet, and mark off its various amounts in order to detect any error that may have arisen. The signature of one is required upon the transfer-form when a balance is to be paid or received, and no small portion of their work is the preparation of elaborate tables setting forth the totals of the vast numbers of cheques and bills passing daily through the House.

The business of the clearers is to enter under the name of the presenting bank the amounts of the cheques and bills—termed in the House 'articles'—drawn upon their own firm. The books in which these entries are made have printed at the head of their columns the names of the various banks; and though the articles have stamped across them the title of the firm presenting, it is no uncommon occurrence for a clearer to enter in his hurry some of them under the wrong heading, and so cause considerable trouble not only to himself but to the clerk who has to balance with him when the work is agreed at the end of the day. The bad figures made by the drawers of cheques are frequently the cause of putting the work wrong; and many a laborious 'tick-up' has to be endured in search of some error which has occurred in consequence of the penchant some people have for making an 8 with a remarkable resemblance to a 5, or writing down a 6 where their intention was to form a mere cipher.

The runners' avocation is to journey frequently between their respective offices and the House, bringing into the latter batches of articles, which they distribute upon the desks of the banks upon whom they are drawn, and returning with those payable by their own firm, and which have been duly entered by their clearers in the 'In-clearing' books.

At the close of business the clearer has brought him the books in which the 'out-clearing articles' were entered before being sent down to the House. The totals of these, with those of his own in-clearing books, he agrees with the other banks, and strikes a balance with each. The balance-sheet has printed in alphabetical order down the middle a list of the Clearing Banks, and on each side of it a money column, that on the left being headed 'Debtors,' that on the right 'Creditors.' The clearer we will say represents the London and County Banking Company; and, starting at the top of the list, proceeds to strike a balance between his firm and the Alliance Bank. He finds, we will assume, that the sum of the Alliance columns in the in-clearing book is, to put the amount in round figures, £50,000, while the out-clearing total is £45,000. This gives a balance of £5000 in favour of the Alliance, and that amount he enters in the right-hand column against the name of that bank. The Alliance clearer, working in the same way, discovers that the London and County Bank owes him £5000, and accordingly inserts those figures in the left-hand column of his balance-sheet. When a similar process has been gone through with the remaining banks, the two sides of the sheet are cast. If the sum of the right side is the larger, the bank has to pay the balance away; if the left exceeds the right, then the operation is reversed. All the Clearing Banks have accounts with the Bank of England, where is also kept the 'Clearing Inspectors' Account,'

the latter being solely used for the purpose of arranging the transfers of the Clearing Banks. Those firms owing balances at the end of the day's transactions authorise the Bank of England to transfer the required amount from their accounts to that of the Clearing Inspectors, from which, in turn, the banks claiming balances are credited with the sums due to them. If there are no errors in the work, the Inspectors' Account will exactly balance; but where a difference exists, the Inspectors have thrust upon them the unpleasant task of searching through the twenty-five balance-sheets in order to detect the mistake.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XXXVIII.—LE CONSEIL DE FAMILLE (continued).

'It is a peaceful day,' Elsie continued, 'that you pass—the most part alone—you with your books. Sometimes you come here to call upon your old friend and solicitor, Mr Dering.'

'Sometimes,' he replied. 'We are very old friends. Though his views are narrow.—Where is he?' He looked about the room. 'You are all waiting to see him? He will be here directly. He is always here about this time.'

'Yes, directly. You remember what I said to you on Sunday concerning certain transactions? I told you how important it was to have the exact truth about them.'

'Certainly. I remember. I wrote an account of them for you.'

'You did. Are these papers what you wrote?'

He looked at them for a moment. 'These are my papers,' he said. 'They are what I wrote at your request. They contain a perfectly true account of what happened.'

'Now, before I go on, you will not mind—these people here do not know Mr Edmund Gray—you will not mind my asking a few persons to testify that you are really Mr Edmund Gray?'

'My dear child, ask all the world if you wish; though I do not understand why my identity should be doubted.'

'Not quite all the world.—Mr Carstone, will you tell us the name of this gentleman?'

'He is Mr Edmund Gray, my neighbour at No. 22 South Square, Gray's Inn.'

Mr Edmund Gray inclined his head and smiled.

George went outside and returned, followed by a small company, who, in answer to Elsie, stepped forward one after the other and made answer.

Said one: 'I am the landlord of the rooms at 22 South Square tenanted by Mr Edmund Gray. He has held the rooms for ten years. This gentleman is Mr Edmund Gray, my tenant.'

Said another: 'I am a barrister, and the tenant of the rooms above those held by Mr Edmund Gray. I have known him—more or less—for ten years. This gentleman is Mr Edmund Gray.'

Said a third: 'I am a commissionaire. I remember this gentleman very well, though it is eight years since he employed me, and only for one job then. I went from an hotel in Norfolk

Street, Strand, to a bank with a cheque which I was to cash for him in ten-pound notes. He gave me half a sovereign.'

'Quite so,' said Mr Edmund Gray. 'I remember you, too. It was a cheque for seven hundred and twenty pounds, the particulars of which you have in my statement, Elsie. I well remember this one-armed commissionaire.'

And a fourth: 'I am the laundress who does for Mr Edmund Gray. I have done for him for ten years. This gentleman is Mr Edmund Gray.'

And a fifth: 'I am a news-agent, and I have a shop at the entrance of Gray's Inn. This gentleman is Mr Edmund Gray, of 22 South Square. I have known him in the Inn for ten years.'

To each in turn Mr Dering nodded with a kindly smile.

'Athelstan,' said Elsie, 'will you tell us when and where you have met Mr Edmund Gray?'

'I met him last week in Carstone's rooms on the same landing. He sat with us for an hour or more.'

'It is quite true,' said Mr Dering. 'I have had the pleasure of meeting Mr Arundel on that occasion.'

'I also saw him,' Athelstan continued, 'at a small lecture Hall at Kentish Town on Sunday evening—yesterday.'

'To complete the evidence,' said Elsie, 'I have myself spent many hours almost daily with Mr Edmund Gray during the last fortnight or so.—Is not that true, dear Master?'

'Quite true, my Scholar.'

'Brother—brother'—Sir Samuel touched his arm—'I implore you—rouse yourself. Shake off this fancy.'

'Let him alone, Sir Samuel,' said George—'let him alone. We have not done with him yet.'

'Yes,' cried Mrs Arundel, who had now left her seat and was leaning over the table, following what was said with breathless interest—'let us finish out this comedy or tragedy—as the case may be. Let no one interrupt.'

'I have also met you, sir'—Mr Dering addressed Checkley, who only groaned and shook. 'It was outside a tavern. You took me in and offered me a drink.'

Checkley shook his head, either in sadness or in denial—but replied not, and at the thought of offering Mr Dering a drink, everybody laughed, which was a relief.

'Dear Master,' Elsie went on in her soft voice, 'I am so glad that you remember all these things. It makes one's task so much easier. Why, your memory is as strong as ever, in spite of all your work.—Now, I am going to read the two statements you wrote down yesterday afternoon. Then you may recall anything else you might like to add. Remember, that as regards this first affair, the cheque for seven hundred and twenty pounds, my brother was charged, on suspicion only, with having forged it. Now listen.' She read the brief statement which you have already seen concerning the business of the first cheque. 'That is your history of the affair.'

'Quite so. Dering drew the cheque at my request. I cashed it. I found that I had no need of the notes, and I returned them. That is very simple.'

'It is all so simple that nobody ever guessed it before.—Now we come to the transfers made in

* Copyright 1892 in the United States of America by Harper & Brothers.

the spring of the present year. You wrote a second statement regarding them. I will read that as well. Please listen very carefully.'

She read the other statement, which you have also seen already. She read it very slowly, so that there should be no mistake possible. During the reading of these documents Sir Samuel's face expressed every possible shade of surprise. Mrs Arundel, leaning over the table, followed every line. Hilda wept—her head gracefully inclined over her pocket-handkerchief, as if it was an urn.

'This is your account of the business?'

'Certainly. There is nothing more to be added. It is a plain statement of the facts. I do not understand how they could be in any way doubted or misrepresented.'

'Would you, Sir Samuel, like to ask Mr Edmund Gray any question?'

'I don't understand. He says that Mr Dering wrote a letter for him.'

Elsie showed him the letter they had seen Mr Dering write, which he was passing from one to the other.

'Where are the transfers?' Sir Samuel went on. 'He says they were placed by himself in the safe.'

Mr Edmund Gray rose and walked to the safe. He laid his hands upon a packet and took it out.

'These are the papers,' he said.

Sir Samuel opened the roll and looked them over. 'They seem all right,' he said. 'This is very wonderful.'

'Wonderful—and sad—most lamentable,' whispered Lady Dering.

'Wonderful indeed!' Mrs Arundel echoed.

'Most wonderful! most unexpected!'

'A moment more, and I have done.' Elsie again took up the tale. 'Here is a cheque to the order of Mr Dering signed by Mr Edmund Gray for the whole of the money lying in his name at the Bank.—You agree, Master, that it is best for the future that all your affairs should be in the hands of your solicitor?'

'I quite agree.'

'Here is a letter to the manager of the Bank, requesting him to pay over Edmund Gray's dividends to the account of Mr Dering.—And now I think I have proved my case. Here in the safe were the ten-pound notes received by Mr Edmund Gray, and placed there by him. Here were the transfers and certificates placed there by him: you have heard half-a-dozen people testify to the fact that you have Edmund Gray before you. His statement of the business has been read to you. It shows, what no other theory of the case could show, how the thing was really done. Lastly, it shows the absolute and complete innocence of my brother and of George.—Have you anything more to say, Sir Samuel?'

'Nothing—except that I was misled by a statement concerning a profligate life among low companions, without which no suspicion could have fallen upon either of you gentlemen. It was'—he pointed to the unhappy Checkley—'a vile and malignant falsehood. Do you hear, sir? Vile and malignant. It only remains for us all to make such reparation as we may—nothing would suffice, I know, but such reparation as we can—by the expression of the shame and regret that we all feel.'

'Athelstan,' said his mother, 'what can I say? Oh! what can I say?'

Athelstan rose—during the long business he had sat motionless in the clients' chair, his head in his hand. Now he rose and stepped over to his mother. 'Hush!' he said. 'Not a word. It is all forgotten—all forgiven.'

But Hilda sank upon her knees and caught his hands.

'George,' said Sir Samuel, 'forgive me. The case looked black against you at one time. It did indeed. Forgive me.' He held out his hand.

Then there was great hand-shaking, embracing, and many tears. As for Checkley he crept out and vanished in the retreat of his own room. 'It is all over,' he murmured—'all over. I've lost four hundred pounds a year. That's gone. All over—all over!'

Mr Edmund Gray looked on this happy scene of family reconciliation with benevolence and smiles.

Family reconciliations must not be prolonged: you cannot sit over a family reconciliation as over a bottle of port. It must be quickly despatched. Sir Samuel whispered to Hilda that they had better go.

'Come,' said Lady Dering. 'We will all meet again this evening at Pembroke Square—and tomorrow evening—and on Wednesday afternoon.—Elsie, you are a witch and a sorceress and a wise woman. You said that Athelstan should give you away, and he will.—Brother, come with us. Leave Elsie to George.—Oh! how handsome you are looking, my poor ill-used brother! Try to forgive us if you can.'

She turned to Mr Edmund Gray. 'Sir,' she said, 'we ought to be very grateful to you—indeed, we are—for enabling us to clear away the odious cloud of suspicion which had rolled over our heads. It was very good of you to draw out those statements for my sister. But I do think that if Mr Dering had told his old friends about you—about Mr Edmund Gray—we should have been spared a great deal of trouble and unnecessary shame.—Good-day, sir.'

Sir Samuel lingered a moment. He looked as if he would appeal to Mr Edmund Gray as to a brother. 'Don't speak to him,' Elsie whispered. 'Let him alone. He will become himself again presently. Let him alone.'

So he went out, and the door was shut, and Edmund Gray was left alone with George and the Scholar.

'My Master'—Elsie sat down beside him—'I fear you have been interrupted. But indeed it was necessary. Don't ask why. Things get into a muddle sometimes, don't they? You have gathered something of the trouble, too. Now that is all over—past and gone.'

'I am glad for your sake, child.'

'Master—dear Master—I have a confession to make. When I found out who you were—I mean what manner of man you were—my only thought at first was to coax you and wheedle you and flatter you till you gave me exactly the information that I wanted. I confess it. That was my only purpose. Nay—more—for the sake of my lover and my brother I would do it again. Well—I found that the only way to win your confidence was to pretend to be your Scholar and

to believe all you taught. So I pretended. So I won your confidence. So I obtained all I wanted. So I have made it impossible for even the most malignant creature in the world to pretend that these two men had anything to do with what they called a forgery. But—believe me, dear Master—while I pretended, I was punished, because my pretence is turned to certainty.'

'Child, I knew it. You could not pretend—no woman could pretend so as to deceive me on a point so simple.'

'Dear Master, you do not know the possibilities of feminine craft. But I pretend no more. Oh! I care not how you make your attempt, whether you destroy Property or not. Mr Dering says that Property is Civilisation—but I don't care. To me it is enough to dream—to know—that there is an Earthly Paradise possible, if only men will think so and will keep it before their eyes, though it be as far off as the blue hills. It is beautiful only to think of it: the soul is lifted up only to think that there is such a place. Keep the eyes of your people on this glorious place, dear Master: make it impossible for them to forget it or to let it go out of their sight. Then, half-unconsciously, they will be running, dragging each other, forcing each other—exhorting each other to hurry along the dusty road which leads to that Earthly Paradise with its Four-square City of the Jasper wall. Preach about it, Master. Write about it. Make all men talk about it and think about it.'

She threw her arms round his neck and kissed him.

'Master, we shall be away for a month or two. Then we shall come back, and I shall sit at your feet again. You shall come and stay with us. We will give you love, and you shall give us hope. I have made my confession. Forgive me.'

They left him sitting alone. Presently he arose, put all the papers back in the safe, and walked slowly away—to Gray's Inn.

Next morning when he opened his letters he found one marked 'Private.' It was from Sir Samuel.

'DEAR EDWARD,' it said—'We are all very glad to tell you that the business of the shares and certificates is now completely cleared up. Checkley is not in any way concerned in it—nor is George Austin. And I am happy to say there is a complete solution of the former mystery which entirely clears Hilda's brother. Under these circumstances, we are agreed that it is best for you not to trouble yourself about any further investigations. You will find in the safe the transfers, a cheque to yourself of all the money received by Edmund Gray, and an order in the Bank concerning the dividends. You have been the victim of a very remarkable hallucination. I need not explain further. Mr Edmund Gray, however, is undoubtedly insane. I hear, and have myself observed, that you have been greatly disturbed and distressed by these mysterious events. Now that they are settled finally—I may say that only a happy chance set us on the right track—we all hope that you will be satisfied with our assurance, and that you will not trouble yourself any more in the matter.—Your affectionate brother, SAMUEL DERING.'

Mr Dering, after reading this letter, got up and

looked in the safe, where he found the papers referred to. He rang the bell. 'Checkley, who has been at my safe?'

'Nobody but you.'

'Don't tell lies. Who put those papers in the safe?'

'They must have been put there yesterday—you were in the room.'

'Yesterday—what happened yesterday?'

Checkley was silent.

'Who was here yesterday?—Go on, Checkley. Don't be afraid.'

'Sir Samuel was here—and Lady Dering—and Mrs Arundel—and Miss Elsie—and your Partner—and Mr Athelstan. Two or three more came in and went away.'

'That will do. You need tell me no more. I don't want to know the particulars.—Checkley, my day's work is done. I have thought so for some time past. Now I am certain, I shall retire.'

'No—no,' cried Checkley, the tears running down his face. 'Not to retire—after all these years—not to retire.'

'I know now the meaning of my fits of forgetfulness. I have feared and suspected it for a long time. While I am lost to myself, I am going about the world, doing I know not what. And I will not ask. I may be this Edmund Gray who preaches Socialism and gives me his precious tracts. I may be some one else. I say, Checkley, that I know now what has happened to me. Deny it if you can—if you can, I say.'

Checkley did not offer any denial. He hung his head.—'This is the meaning of Elsie's strange hints and queer protestations. Half my time I am a madman—a madman.—Checkley, ask Mr Austin to come to me at once. My day is done.' He closed his open blotting-pad and placed the unopened letters beside it. Then he rose and pushed back his chair—the chair in which he had sat for fifty years and more. 'My day is done—my day is done.'

CHAPTER XXXIX.—THE LAST.

Mr Dering left his office, went back to Gray's Inn, and sat down again before the Ivory Gate. Those who have once sat for an hour or two in this place return to it again and again and never leave it. It is, to begin with, the most beautiful gate ever erected. The brain and wit and fancy of man could never conceive such a gate, could never execute such a conception. It is all of pure ivory, carved with flowers such as never grew; curving and flowing lines leading nowhere; figures of maidens lovely beyond all dreams; philosophers whose wisdom reaches unto the heavens; statesmen who discern the gathering forces and control the destinies of a nation; inventors who conquer nature; physicians who prolong life; ecclesiastics who convert the Carthusian cell into a bower of delight; poets who here find their fantasies divine; men and women in work-a-day dress who wear the faces of the heavenly host.

All the dreamers lie here, not asleep, but dreaming. Their eyes are open, but they do not see each other: they see these dreams. Those of the young who are also generous come here and dream until they grow older and are chained to

their work and can dream no more. Men of all conditions come here—even the little shop-boy—even the maiden who cleans the knives and polishes the boots—all are here. The young Prince is here : the little charity boy is here : the lad whose loftiest ambition is that he may one day stand in the pulpit of the little Baptist village chapel is here : here is the undergraduate who was Captain of Eton and will be Senior Classic and Member of Parliament and Minister—even Prime Minister—and will belong to History. The poet is here, and the painter, and sometimes hither comes the novelist, and, but more rarely, the dramatist. Hither comes the musician to lift up his soul with thoughts that only music can give : and the singer, so that he sings more than is apparent from the words : and the actor, so that he puts things into the play never dreamed by him who wrote it. Great is the power, great the gifts, of this noble Gate of Ivory.

Sitting before that gate, such a dreamer as Edmund Gray receives strange visions. He sees clearly and near at hand the things which might be, yet are not, and never can be until man lays down his garb of selfishness and puts on the white robes of Charity. To that dreamer the Kingdom of Heaven, which seems to some so far off and to others impossible, so that they deride the name of it, is actually close at hand—with us—easy to enter if we only choose. He exhorts his fellows to enter with him. And they would follow, but they cannot because they are held back by custom and necessity. They must obey the laws of the multitude, and so they stay where they are. And when the dreamer passes away, his memory is quickly lost, and the brightness quickly leaves those dimly-lighted lives. Yet other dreamers come—every day there arises an Edmund Gray.

Now when Edmund Gray takes the place of Edward Dering, in which guise does the soul, in the end, leave the earth? Are the dreams of Edmund Gray perhaps the logical development of the doctrines held by Edward Dering? Is the present stage of Individual Property—where every man works for himself and his household—one through which the world must pass before it can reach the higher level of working each for all? First men and women hunt, separate : they live apart in hollow trees and caves. Then they live together, and the man hunts for his wife and children. Next, they live in communities, which grow into towns and tribes and nations. Then men rely upon the protection of the law, and work for themselves again. That is our present stage : it has lasted long—very long. Perhaps it will break up some day : perhaps sooner than we think. Who knows? All things are possible—even the crash and wreck of a civilisation which has taken thousands of years to build up. And upon it may come—one knows not—that other stage which now belongs to the dreamer before the Ivory Gate.

The wedding was held then, as Elsie said it should be, shorn of none of its splendours, and relieved of the cloud which had hung over them so long and threatened them so gloomily. Athelstan the Exile—Athelstan the Ne'er-do-well—Athelstan the Profligate—Athelstan the Resident of Camberwell—Athelstan the Smirched and Soiled—stood beside the altar, tall and gallant,

and gave away the bride for all the world to see—nobody in the least ashamed of him. There was not any breath of scandal left. Here he was, returned from his travels, a tall and proper man, dressed in broadcloth, perhaps with money in purse, prosperous and successful in the sight of all. His mother gazed upon him when she should have been looking at the bride or into her Prayer Book. Her eyes were red, but then a mother is allowed a tear or two when her daughter leaves the nest. And as to those who had whispered words about family jars, quarrels and estrangements, or had spoken against the fair fame of the groom, they were now as mute as mice.

All the richer members of the House of Arundel—the City Arundels—were present. One of them—chief partner in a leading firm of accountants—afterwards computed, for the greater increase of the family glory, how many hundreds of thousands of pounds were gathered together at one moment beneath that sacred roof. He counted the members, and made that little addition, during the performance of the ceremony. Those of the Austins who were not disgracefully poor—there are some branches of the family, I believe, pretty low down—were also present. And the company went to Pembroke Square after the service, gazed admiringly at the wedding presents, and drank the health of the bride and bridegroom, and gathered with cousinly curiosity round the returned Prodigal. But they knew nothing—mind you—of his connection with Camberwell. And nothing about his supposed complicity in the Edmund Gray business. There had been, happily, no scandal.

Among the company in the church was Mr Dering. He stood tall and erect, his coat buttoned, his face keen and hard, the family lawyer stamped by nature and long custom.

Presently, when the service was about half way through, a change came over him. His face relaxed : the lines curved just a little laterally, the austerity vanished, his eyes brightened. He took off his gloves furtively and opened his coat. He was Edmund Gray. In that capacity he afterwards drank to the bride and wished her happiness. And he walked all the way from Pembroke Square to South Square, Gray's Inn.

I see in the future an old man growing feeble : he leans upon the arm of a girl whom he calls his Scholar, his disciple, and his child. His face is serene : he is perfectly happy : the Advent of that Kingdom whose glories he preaches is very nigh at hand. He lives in the house of his disciple : he has forgotten the very existence of his lawyer : he goes no more to Lincoln's Inn : always he is lying, night and day, before that miracle of carven work in Ivory. There he watches—it is his Vision—the long procession of those who work and sing at their work and are happy, work they ever so hard, because they work each for all and all for each. And there is no more sorrow or crying and no more pain. What hath the Gate of Horn—through which is allowed nothing but what is true—bitterly true—absolutely true—nakedly, coldly, shiveringly true—to show in comparison with this? A crowd trampling upon each other : men who enslave and rob each other : men and women and

children lying in misery—men and women and children starving.—Let us fly, my brothers—let us swiftly fly—let us hasten—to the Gate of Ivory.

THE END.

THE MONTH: SCIENCE AND ARTS.

ONCE more have we arrived at that period of the year when the meeting of the British Association tells us of the progress which scientific knowledge has made during the past twelve months. The meeting this year in the Scottish capital, while it has not attracted quite so many members as was anticipated, has been full of interest, both in the quality of the excellent addresses which have been delivered by the Presidents of the various sections, as well as in the papers on widely divergent subjects which have been read by the members. In glancing through the various subjects dealt with, it would be difficult for any person not to find some topic of interest peculiar to himself.

It would be impossible, as it is unnecessary, to give even a brief review of the various subjects dealt with by the Association; but as an instance of the extent of ground covered by them we will mention two of totally different bearing. The one is a paper on the 'Utilisation of Flowing Water as a Motive-power,' contributed by Messrs Purdon and Walters of London. The motor designed by these gentlemen for the purpose of driving electric, pumping, grinding, and other machinery consists of a pontoon fitted with blades fixed at intervals on an endless chain, passing over vertical wheels. These blades, when the pontoon is anchored, are carried forward by the tide, and so give motion to the wheels. The other paper to which we refer is contributed by Mr W. H. Preece, on 'The Destruction of Lightning-protectors by Recent Municipal Legislation.' In this paper Mr Preece assumes that the extraordinary immunity of private dwellings from lightning-stroke arises from the metal on the roofs together with the draining-pipes in connection with it forming a passage for the electricity to earth. The present system of detaching the pipes from the drains, in order to prevent egress of sewer-gas, must, he believes, do away with this protection, unless at least part of the metal pipe is allowed to bridge over the gap. If Mr Preece's argument be correct, it would seem that our houses have all been furnished with lightning-conductors without our cognisance.

The 'penny-in-the-slot' principle of commercial supply continues to meet with fresh applications. In some parts of Paris a pailful of hot water can be obtained from street standards for a five centime piece. Another phase of the slot-principle will be welcomed by railway travellers, who will presently be able to obtain half an hour's radiance from a three-candle-power electric lamp for the expenditure of one penny. It is said that the Metropolitan District Railway will be the first to have its carriages fitted with the penny-'slot' lamps, which are of the most ingenious construction; but if the scheme prove practicable, all the other lines will be obliged to

follow suit. The substitution of electric lamps fed by a current generated by the moving train, for the old dim oil-lamps, which necessitated so much work in trimming, removing, and lighting, must have already proved as great a saving to the companies adopting it as it has been a comfort to their passengers.

The Pearl-fishery of the Gulf of California forms the subject of an interesting Report contributed to the Bulletin of the United States Fish Commission. The pearl-diver as here described has none of that romance attaching to him which in past times was associated with this occupation. He is simply a submarine labourer, like those who are engaged round our own coasts and in rivers for harbour and bridge construction. He is furnished with the regulation india-rubber suit and brass helmet, and is supplied with air from an attendant boat, so that he can remain at work for an hour or more, instead of the sixty-seconds' plunge into sunlit water which used to be the diver's lot. He gathers the shells into a wire-basket, which is hauled up when full by his companions in the boat. During the summer, the entire eastern coast of California forms the base of operations for the pearl-divers.

A volcanic eruption, which seems only second in severity to the outburst some years ago at Krakatoa, in the Strait of Sunda, occurred in June last at Great Sangir. Some particulars of the disaster have come to us, given in letters from the chief Dutch settlement in the north of the Celebes, from which the scene of the disturbance is distant about three hundred miles. Without any of the usual warnings of a seismic character, a volcano near Tarvena, the capital of the island, suddenly threw out stones of considerable size, which killed hundreds of persons, and caused the light wooden houses common to the country to collapse with the weight of material accumulated on their roofs. Great streams of lava flowed at the same time with awful rapidity down the sides of the mountain, and swept houses and their inmates away in their terrible embrace. The total loss of life is estimated as nearly as it can be at many thousands.

It has long been foreseen that the sailor as Nelson knew him is doomed to extinction, for the work formerly done by his muscular arm is now done by hydraulic and electric power. Even the work of holystoning a ship's deck is to be his no longer, for a machine has been constructed which will move the stone in any required direction over the surface of the boards, and will do the work very much quicker, if not better than it could be done by Jack. The machine is patented by Captain Lowberg of New York.

The chemist to the American Department of Agriculture has recently called attention to a novel system of butter adulteration which is carried out by a preparation called 'Gilt-edged Butter Compound.' The advertisers of this substance claim for it that added to a pint of milk and a pound of butter, the whole being churned together, the product will be two pounds of butter. This result is verified by the trials which have been made with the Compound at the Government Laboratory; but analysis shows that the butter produced contains three times the normal quantity of water and half the proper

percentage of butter-fat. The trick is a most ingenious one, and is explained by the fact that the Gilt-edged Butter Compound contains a large quantity of pepsine, an organic substance which has the property of enabling butter to take up its bulk of milk without materially altering its appearance.

All English-speaking peoples will be gratified to learn that Anne Hathaway's Cottage at Stratford-on-Avon has been purchased for the public by the Shakespeare Birthplace Trustees. For many years this cottage, the home of her who afterwards became Shakespeare's wife, and the scene of his courtship, has been shown to visitors to the shrine at Stratford, but it has been in private hands. It was recently advertised for sale, and ultimately secured by the Trustees, together with the many relics which it contains of him who was 'not for an age, but for all time.'

Mr James Morris of Glasgow has recently discovered a new method of producing Gems artificially, but as yet he has given no details of his method of procedure. He says that the process which he has adopted is a simple one, and that many analogies point to the probability of its being one of those followed in Nature's laboratory. The products which he obtains consist of rounded and compact crystals composed chiefly of alumina. They are transparent, and by special treatment will take a blue colour, and although the bulk of them may be described as sapphires, some at least are believed to be diamonds. These last, however, are much smaller than the chief crystals, which approach one-sixteenth of an inch in diameter, and they have not yet been exposed to those tests which would identify them as diamonds. 'The sparkle of some of these small crystals,' says Mr Morris, 'is magnificent. Carbon is present in the production of all the crystals, and some of the aluminous ones contain a little of that element.' It is not easy to anticipate what would be the result of the discovery of a method by which gems of large size could be manufactured, but certainly it would be one which to many would be most unwelcome.

Two melancholy accidents through balloons becoming ruptured in mid-air have led to experiments being made with a view to save life under such conditions. One *aéronaut* in France fitted the top of his balloon with a parachute which overspread the upper part of the gaseous envelope. He then made an ascent, and, with marvellous confidence in the value of his improvement, purposely cut the fabric of the balloon and let the gas escape. The parachute then expanded, and the occupants of the car sank slowly and safely to earth. In another experiment, conducted in this country, to show that if the neck-line of a balloon were left untied, the silk envelope would itself form an umbrella-like parachute, the car had no occupants, but was weighted so as to represent a crew of three persons. By means of a fuse and a weight the fabric was automatically slit from top to bottom when the balloon was at a height of three thousand feet, upon which the material assumed the form of an inverted basin and came down gently. It is argued from the result of this experiment that the occupants of a burst balloon would come safely to the ground,

if they only have the presence of mind to cut the neck-line.

Probably one of the most charming exhibits at the coming World's Fair at Chicago will be the Irish Village which is being arranged under the auspices of the Countess of Aberdeen and Mrs Ernest Hart. In this village there are to be seven cottages, in each of which will be carried on a different industry, such as spinning, dyeing, weaving, embroidering, lace-making, &c. There will also be a model dairy, with dairymaids making butter from the milk of real Kerry cows. In this village will stand a 'replica' of Donegal Castle, an old well, and other Celtic memorials.

Photography has long proved of value as an aid to astronomy, and it is a matter of common knowledge that a complete photographic survey of the heavens has for some time been in progress. As a good instance of the manner in which the camera can be used to solve an astronomical problem, we may point to the work recently undertaken by Mr Isaac Roberts, F.R.S., in his search for hypothetical planets existing beyond the orbit of Neptune, which has generally been regarded as the limit of the solar system. Professor Forbes twelve years ago predicted that two such planets exist; and Mr Roberts recently agreed to search for them by photographic methods, if the Professor would point out their supposed position. A chart was made of the region indicated by Professor Forbes, and this was covered by eighteen photographic plates, two sets of photo-plates being taken at intervals of seven days between the exposures. The dual photographs so obtained were then superposed, in order to see if any star appeared on one plate which was not on the other, and to detect any change of position in any particular star which might have occurred in the interval between the two exposures. By this method Mr Roberts was able to assert that there was no planetary body in the region indicated.

Waterspouts are very seldom seen in Britain, but their occurrence is occasionally recorded. In July last much damage was caused by one of these unwelcome visitors, which made its appearance on the Yorkshire wolds in the neighbourhood of Langtoft. After travelling for some distance, its progress was arrested by a hill, upon which it expended its force. After cutting three ditches, two of which were nearly thirty yards long, and about ten feet deep, and scattering the expelled rock, amounting to many tons, the village of Langtoft, lying at a lower level, was inundated by the released water, which formed a volume seven to ten feet in height. Two cottages and a workshop were destroyed; but the loss of life was happily confined to a few pigs, some sheep, and poultry. Curiously enough, a similar visitation occurred on this same hill four years ago.

In a recent Report by the Consul-general of Smyrna several interesting details are given concerning the Sponge-trade of that district. As a whole the industry has suffered a decrease as compared with the year 1890; but while the output of sponges of the fine quality was less, the prices realised were higher; but sponges of an inferior kind were sold at unremunerative rates. Districts which have long been in use are becoming exhausted, and although new fields are being discovered, the produce from them does

not yet compensate for the decreased supply from the old ones. The risks attached to the occupation have increased, for the men are tempted to descend to greater depths than formerly, and as many as eighty fatal accidents are recorded for the past season. This, out of a total of four thousand men employed, is a high percentage. Fishing continues throughout the winter season, but not in the same localities as during the summer. A parasitical weed which infested the sponges some years ago and gave much anxiety is gradually decreasing in quantity.

Rain which on touching the ground crackles and emits electric sparks is a very uncommon, but not unknown phenomenon. An instance of the kind was recently reported from Cordova, in Spain, by an electrical engineer who witnessed the occurrence. The weather had been warm and undisturbed by wind, and soon after dark the sky became overcast by clouds. At about eight o'clock there came a flash of lightning followed by great drops of electrical rain, each one of which on touching the ground, walls, or trees gave a faint crack, and emitted a spark of light. The phenomenon continued for several seconds, and apparently ceased as soon as the atmosphere was saturated with moisture.

In the interesting Cantor lectures on Mine-surveying, lately delivered at the Society of Arts by Mr Brough, much attention was devoted to the divining-rod and its pretensions as a discoverer of hidden minerals, a use to which to a considerable extent it is still put. While the hazel fork or divining-rod cannot be regarded seriously as an aid to the miners, it is of great value in the discovery of iron ore when it takes the form of a magnetic needle, for by noting the inclination or 'dip' of the needle as the ground is traversed, some idea of the extent of the deposit can be formed. An instance is recorded by Professor Le Neve Foster where a bed of iron ore lying below a lake in Sweden was correctly mapped by observations of this kind in winter when the water was covered with ice. This method of surveying has not escaped the keen scent of the fraudulent. In some cases the inclination of the needle has been helped by the approach of a walking-stick containing a concealed magnet, and it is not difficult to make the needle itself give unreliable testimony.

A curious fact connected with the French revenue has been made known. It is forbidden, on the shores of the Mediterranean, to draw any sea-water without a permit from the civil authorities. A well-known Englishman, staying in a villa on the Riviera the garden of which runs down to the sea-shore, could not obtain a painful of sea-water without permission of the civil power. The story is corroborated by others, who tell us that not a servant or villager can be induced to rob the ocean of a quart of water without permission of the Mayor of the district. The explanation of this apparent anomaly is that the French revenue derives benefit from a tax on salt, and if sea-water were free to all, the peasants would boil it down and make illicit salt.

The terrible disaster at St Gervais by which an hotel and most of its occupants was washed away in the dead of night, has been investigated by different men of science, who do not, however, agree as to the causes which led to

the catastrophe. One theory is that the usual drainage from the glacier from which the disaster undoubtedly originated became either totally blocked or partially obstructed, and that in this way a volume of water was pent up, which gradually acquired sufficient pressure to break its bonds. A more likely theory is that held by Professor Forel, who says that a body of water sufficient to do so much damage could not accumulate in so small a space as that assigned to it. He believes that the disaster was due to the natural movement and breaking-up of the glacier, and that the avalanche consisted of what he calls a lava of ice and water. The ravine shows no trace of any great evacuation of water; but he found the earth mixed with powdered ice, while great blocks of glacier ice were strewn in every direction. The catastrophe was caused then, if this latter theory be adopted, by an avalanche of ice starting at an altitude of ten thousand feet, which was 'pulverised by its fall, a large portion of it being melted by the heat generated in its rapid passage, and contact with matters relatively warm.' The falling mass was further liquefied by mingling with the water which finds its natural outlet at the ravine in question.

THE TURN OF THE WHEEL.

I.

'THAT be a relief!' exclaimed Micah Daggles as he threw down his hammer and drew his sleeve across his forehead.

It was striking one o'clock. They could just hear the quarters from the Stent parish church, about a third of a mile from the Rathole.

The other workers in Micah's shop also uttered exclamations of gladness. It was a blazing July day outside the shed. Inside the shed, where three fires were going, blown on by bellows, it was as hot as it well could be without being unbearable. These other workers comprised Mrs Daggles, Ruth Daggles, Adam Gray, and a boy. It was almost a family affair, this chain-shop of the Rathole. Adam Gray, though no relation, in fact, had won Ruth's heart, and was to marry her when—

But this brings us to the pathos of the place. Trade was extremely bad. It had steadily worsened for years. The big chain-factories had swallowed up scores of the domestic workshops. Not absorbed them, giving compensation for so doing; but driven them into extinction by the facilities they naturally obtained for underselling them. What became of them afterwards no one knew. The men and women left the neighbourhood, some well-nigh broken-hearted. The Stent district, though spoilt by these factories, is not without attraction; and after all, home is home, be it a palace in a shire, a hovel in Stent, or a single room in a Whitechapel alley.

The Daggles had come down in the world. Micah's father had been reputed a well-to-do man. The bankers of Stent had treated him with a certain deference that meant much in a pecuniary sense. His bills were always met, with never a word about extended time. There was then, too, a certain rude plenty in the old red house: meat on the table every day, and no lack of bones for the three white bulldogs which

for fully ten years seemed to occupy almost too much of old Daggles's spare time.

But the old man died one day, with a queer sort of smile on his face. 'Mebbe, Micah, thou'lt be a rich man—mebbe thou won't,' he murmured.

This oracular statement did not affect Micah much at the time. But after the funeral—with abundance of feathers, and half Stent at their doors uttering exclamations of rapture—Micah betook himself to the bank in his sleek Sunday clothes, and asked the manager to please to tell him how much money he had inherited. The old man had been mightily reserved. He always drew the wages himself, and attended to cheques and all commercial matters. His son was just a paid employee of his—rather more favoured than the rest of course, but little else. But the banker had merely lifted his eyebrows and said there was nothing in his hands to the late Mr Daggles's credit. There had been once upon a time, he allowed, a matter of thousands; but it had all been withdrawn. He rather fancied the chain-maker had invested it in land, was exceedingly surprised at the deceased man's reticence, and was sorry he could say nothing of a more satisfactory kind for Micah.

Time passed, and affairs stood as they did on this particular day of disappointment. No one knew in the least what had become of old Daggles's money. Micah had questioned every lawyer within ten miles of Stent on the subject, had, in fact, become liable for an astonishing number of six-and-eightpences quite to no purpose. And as the outcome, it appeared he was the heir to nothing in the world but the old workshop, the old red house adjacent, and a strip of soft ground behind, some twenty yards by five, which sloped towards a certain black brook between elder-bushes, famous for the size and number of its rats. Hence the style of the immediate neighbourhood: Rathole.

Micah had married three or four years before his father's death, and Ruth was born. In compliance with local custom, Mrs Daggles, when she was freed from the embarrassments attendant upon little Ruth's birth, had entered the workshop and wielded a hammer with the rest. She was a large woman, of the common Stent type: fond of bright Paisley shawls and drooping feathers to her bonnets, with a very red face, and great arms which made nothing of the ten-pound hammers. And she was not slow to proclaim her opinion that her husband's father had behaved very shabbily in doing away with the money she, in common with others, believed had been saved up for the next generation.

Since then, all sorts of discomfiting events had happened. The first large factory had been established—a huge haunting building of red brick with a tall chimney. Others had followed it; and now daily you might see men and lasses in troops entering the gates of the various works. Trade had languished, and the price of materials had risen, while the ability of Micah's customers to pay enhanced values had gone down. Little by little the old Daggles connection had died off. It was not easy—it seemed almost impossible—to get new patrons. These were secured by the big works. Nor was it easy to get workers to grub and hammer in the pokey little domestic

forge, when in the large establishments they got higher wages, better and a more extensive society, and where the sanitary conditions were better cared for.

Thus, from eight paid hammerers, the workshop had fallen to one—young Adam Gray. The odd lad who took charge of one of the bellows was of small account. Adam Gray was an anomaly in Stent. He had none of the braggart, self-assertive ways of the other chain-makers; nor did he care two pins about pigeon-flying, horse-racing, coursing, or poaching, which were the favourite holiday pursuits of the districts. He was a quiet, almost a moping sort of lad, with long hair and a reflective look. Mrs Daggles did not think much of him; but she forebore to tell him so, fearful lest he, like his predecessors, should straightway give notice. Micah, on the other hand, had a certain regard for the lad. There was something in Adam's face and in such of his mind as he exhibited that convinced Mr Daggles that his assistant was not, as Mrs Daggles playfully expressed it more than once, 'such a fool as he looked.' Adam had a fine pair of brown eyes. He was, besides, strong in the arm and phenomenally industrious.

Ruth Daggles had entered the workshop in her tenth year. That was before state legislation made it penal to employ young girls at hard chain-work. She was a delicate little slip of maidenhood, and Adam from the first resented seeing her little arms bared to such work as she had to do. The attachment that grew up naturally between them increased with the years. Ruth, though distinctly pretty in a fragile way, was almost as shy a girl as Adam was diffident among mankind. The two went about together, much to the amusement of Stent. Mrs Daggles did not appreciate such a courtship. But Micah said: 'Let 'a be—the lad's a good un, and the wench loves him. I'll ha' no comin' between um.'

This was how matters stood in the Daggles household when Micah flung away his hammer and breathed with satisfaction. He adopted the conventional division of the day that Adam might have the less cause for discontent with the lower rate of wages he received, and, for Ruth's sake, received willingly. All four left the workshop as if it were a Purgatory, as in truth it was that day.

'Put on thy coat, wench,' said Micah when he saw Ruth bare-armed to the shoulder, and with her dress open at the throat, inhaling the scant July breeze with avidity. Her little face was sadly pale, and her blue eyes seemed preternaturally large. But ere Micah had finished speaking Adam had anticipated him.

'I dunnot want it, Adam,' murmured the girl as she fidgeted under the cloak.

'You'd catch a cold, else; you are such a one for colds, Ruth.'

A sudden rush of petulance took possession of the girl. It was not wonderful. The poor lass had been worked beyond her strength. Chain-making is never an agreeable employment. The hot days of summer had told upon her.

'I'd like rarely to ketch a cold as should carry me right away to the churchyard—that I would,' she exclaimed. Tears broke from the blue eyes as she said these naughty, though not unpardonable words.

Micah looked at his daughter in surprise, and his face assumed an expression of grievous anxiety. None knew better than he how little chance there seemed of excusing Ruth from the work she did in the forge. The bellows must be blown. The lad could not attend to two pair at once; nor could he, Micah, afford to pay another hand. Things seemed almost desperate with him.

'Come, my wench,' he said nevertheless, with a tone of tenderness that in the grimed and wrinkled man was very touching, 'keep up thy heart; joy cometh in the morning, the Book says.—Bring her in, Adam, lad, to her dinner. I wouldn't be surprised, not I, if there was to be a bit of pork on the table to-day. Thou wert allers a good little un for pork, Ruth.'

The girl surrendered herself to Adam.

'I'm so tired,' she whispered. 'I didna mean to bother poor feyther.'

Adam stooped and kissed the pale face, where a tear was beginning to run. 'Your father's right,' he said. 'Never fear; it'll be better by-and-by. I had a black dream last night—it goes by contraries, you know, dear. I'll work the extra this evening, and you shall go at five.'

The tear-dimmed look that Ruth gave him was enough reward to Adam for his offer of self-sacrifice.

Then they went in to dinner, which did in fact include some salt pork with the potatoes. Salt pork, potatoes, and bread do not make up a great meal; but they dined worse three days in the week.

Yet another shock was destined, however, to come upon Micah Daggie that afternoon. They had hardly begun to work again when a black-coated young man appeared with a paper. 'Mr Branstone has sent me with this, Mr Daggie,' he said. 'I'm sorry to have to bring it.'

'What is it, sir?' asked the chain-maker, looking about for his iron spectacles. 'There be no papers due yet awhile.'

'It's about the mortgage. Those people want to build another factory; and unless you can pay, I'm afraid they mean to foreclose, take possession, you know, and just pull down your place.'

'Pull down this 'ere house, which was my gran'feyther's?' exclaimed Daggie.

'That's just it, Mr Daggie. But you must try and find the money.'

'I canna do that, sir. I'd as well hope to find a gold mine. Well-a-day, it be hard!—How much time do they give me?'

'A month, Mr Daggie.'

'One month—only a month. Well, if the Lord dunnot provide in that time, they shall have their will o' me, sir.—I wish you good-day.'

II.

August opened very wet in Stent. The black brook of the Rathole surged in its bed with a riotous music that was never heard except in flood-times. For a week it rained daily—heavy tempestuous downpours, with big drops. It was good weather neither for farmers nor chain-makers.

Micah Daggie and all in his shop were, however, less concerned about the weather than about

the calamity that was impending over them. On the 14th of the month, if money was not found, they would have to go elsewhere.

'It'll just break my heart, though I winna say nowt about it,' said Micah to Adam one day. To which young Gray made no reply. What reply could he have made?

There were snatches of talk between them about America, or joining one of the large factories as paid hands. It would have to be one or the other. There was no money for the passage to New York. The issue, therefore, seemed a foregone conclusion. But it was a sad come-down for Micah, whose father and grandfather had both been independent employers of labour themselves.

'If only,' began Adam one evening as they sat in the gloaming under a stunted old apple-tree, and listened to the tumult of the stream—'if only I could get some one to take up this idea of mine!'

Adam had the self-contained temperament of the inventor. He had already made two or three clever improvements in the domestic machinery, which, from his ignorance of common protective measures, had soon become public property. Of late, however, he had, as he fancied, conceived a plan by which chain-production might be increased in a very simple manner. He was so fearful that this also should get appropriated, that he let no one into the secret except just Micah and Ruth. Money was necessary to test it fairly, and he had nothing like enough money for the purpose. Hardly had he said these words, when they both heard a cracking sound. Immediately afterwards Mrs Daggie and Ruth came running down the little puddly garden path.

'Th' house's falling, Micah!' cried Mrs Daggie.

They stood all together by the ancient apple-tree and watched.

A thin smile stole over Micah's face. 'I knew,' he said, 'as my gran'feyther 'ud never let owt but Daggies have to do wi' it.'

'Still, it would be such a pity if it was to break down now,' added Adam. 'It's the damp. There's been crownins' in all over Stent. You know that pub. by Rachel Row, the *Gammon of Bacon*. Well, it sank three feet last Sunday night, and none on 'em knew about it till they got up and found the sitting-parlour windows level with the ground.'

Ruth had instinctively ranged herself by Adam, whose arm, also instinctively, was round her neck.

'Tales like them bean't over-comforting,' observed Mrs Daggie snappishly. 'It 'ud be fine and nice to be wi'out a roof to our heads—in this rain and all.'

They waited for half an hour; then, no further symptoms of collapse having declared itself, they slowly re-entered the house.

'It's a mossul o' one side,' said Micah with a forced laugh as he lurched against the right-hand wall. 'But that's nothing,' he added hastily. 'There's a many houses in Stent as has been like that for years an' years, an' never the worse for it.'

Adam looked dubious, and his eyes wavered between Ruth and the tallow candle in the kitchen, which could be seen guttering at a considerable angle on the table. 'I'll fetch Jake

Carter,' he exclaimed as he snatched up his cap ; 'he'll know if it's safe.'

Jake Carter soon came, laughed at the idea that there was any real danger in a house so slightly tilted, and then went away, refusing the glass of beer that was offered to him.

An hour after this the house was wrapped in utter darkness. The Daggles and Adam were all abed, and the heavy rain and the noisy brook echoed about it.

But Jake Carter's wisdom on this occasion was at fault. Towards one o'clock, when the heavens seemed like to be wholly liquidated upon the earth, there was another resounding crack throughout the house, and in an instant the back part of the building, on the side which had already yielded, broke into the ground. The loss of equilibrium sent the chimney-pots flying ; and one of the inner walls fell with a crash. The lesser noise of breaking china and sliding furniture could also be heard, followed by a scream from Ruth, and Micah's and Mrs Daggles' voices intermingled.

Adam slept on the ground-floor, in the room in which Micah's father had died. It was just here that the subsidence was most emphatic. He awoke with a sense of calamity upon him, heard the clamour of the general ruin, and was then sensible that his head was much lower than his heels. In this uncomfortable position he heard something else. If it was not the chink of gold pieces in numbers, then his recollection of the sound as he had heard it in the bank when he had changed a cheque for Micah was much disordered for the moment. However, he did not heed this agreeable music. He was much encumbered, and all his wits were necessary to enable him to get out of bed and grovel upon his hands and knees towards the door. Ruth's cries much stimulated him.

An hour passed, and then all the four members of the household were reunited outside in the drenching night. No one was hurt. Ruth had been merely frightened. She was quite calm again, now that Adam had her in charge.

They went to a neighbour's house, where they were given such accommodation as was possible. Here it was that Adam recalled to mind the noise of gold pieces.

'Micah,' he said, 'if there is not money in the house, my hearing is at fault. It was like bagfuls of it breaking against each other.'

At first the chain-maker made light of the matter. 'Thou wert but half awake, lad, an' it was the glasses bursting thou heardest.' Later, however, he suddenly became serious. 'See,' he whispered ; 'the daylight is here, an' it doan't rain so much. What dost say—us two'll just step across an' look at th' ould place.'

Mrs Daggles, too, wished to accompany them, mindful of her Sunday gowns, a favourite kitchen clock, and certain other articles she wished to secure from possible ruin. But Micah bade her lie down again and keep Ruth company.

They had much ado to get into the building, and could move in it only on their hands and knees. But the moment they were in Adam's room the truth of his tale was evident. A timber had started from the wall and knocked out several bricks ; and with the bricks three boxes had come out. These latter lay in a heap in the sunken corner with a number of sovereigns still

in them. As for the coins that had got dislodged, they were in double handfuls in the corner of the room. There was also another similar box still in the hole whence the others had tumbled, and this, too, proved to be full of gold.

The two men sat on the floor and looked at each other. Adam was the first to speak. 'I knew that good would come of it, Micah ; though I'll allow I hadn't much hope how it would come.'

'It's my feyther's savings—there bean't a doubt in the matter,' retorted Micah. 'Praise the Lord, for sure good *hev* come from this evil.'

Then they set to work and collected the coins. They replaced them in the boxes, which were just ordinary workshop boxes for chain-litter, and without lids. And carrying them in their arms, sweetly conscious of their weightiness, they returned to the house, where Mrs Daggles and Ruth lay awaiting them.

'See what we've found, my dears,' cried old Micah joyfully as he plumped his burden upon the floor. 'We're rich for life—all four on us.—An' we'll hev your invention put up in Lunnun, Adam, where they're all fine an' honest, I've heard tell. An' you shall hev the wench here whenever she likes to say "I'll hev you."'

Adam laughed somewhat shyly. Mrs Daggles was too much occupied with the gold to heed anything else.

'I think, Master,' said Adam, 'I'll be wise to strike while my chance is warm.—Will it be "Yes," Ruth, if I ask you now this very minute?' He took the girl's hand, she assenting, with a happy light in her eyes. 'I've loved you ever since you were a mite—you know I have,' proceeded Adam. 'Will you be my wife for better or worse, Ruth?'

The 'Yes, Adam' of her reply was fully as cordial as the young man could have desired it to be.

There were six thousand five hundred sovereigns in the boxes—quite enough, as Micah said, to set up a big chain-factory if he had a mind to build it. But he preferred to live on the interest of it in a snug house outside Stent. The five hundred pounds that were appropriated to further Adam's invention turned out a remarkably good investment. It did not result in a fortune, but it brought in a very comfortable living for Adam and his wife.

A CURIOUS CALLING.

'WHAT ! never heard of a "husher?" Then we'll interview one.'

My friend who made this remark had been employed as an enumerator during the last Census, and his work had brought him into contact with men and women following remarkably curious occupations in order to procure the means of existence. Of these the trade of a husher is certainly not the best known to the general public.

Hushers, I discovered, was a name given to those men who make a living by raking away the accumulated mud from the walls and grubbing and hunting for unconsidered and other trifles in the sickening effluvium of the metro-

politan sewers. The reader might well be pardoned if he imagines that these men are small and emaciated, with pallid countenance and one-foot-in-the-grave appearance. That this is not the case was vouched for by the singularly strong and robust individual we interviewed. He had worked some thirty-five years as a husher, and had never experienced a day's illness in his life. His appearance was so florid and healthy, that I suggested he might be an exception among those who followed this odorous occupation. Not so, however; as a class, these men are remarkably healthy, and escape sickness of all kinds in a manner astonishing. This fact, as true as it is unaccountable, has always been a puzzle to doctors generally. The hushers themselves never tire of declaring they receive great benefit from the gases they inhale in the sewers. Be this as it may, their lot does not seem to be a particularly happy one, although the average earnings of each man in a gang of five or six are better than those of an ordinary artisan.

For several reasons, hushers invariably work in gangs, each gang being accompanied by an old hand, who knows every inch of the ground, and is capable of conducting them all over underground London. Under his guidance—without which they would soon lose themselves—they travel long distances, and are enabled to scour not only the main sewers but also many of the smaller branches. A good lookout man is also posted at the entrance. The absolute necessity of this individual may be judged by mentioning the fact that should a shower of rain come on suddenly, the hushers would, unless warned, be washed into the river.

Until recently, the not very prepossessing entrances to the main sewers could be seen by any one travelling down the river by boat, and the general public could enter them if they so wished. These entrances have now been blocked by the authorities. The hushers are therefore 'barred' by heavy iron gates from entering the main sewers direct, and have consequently to make their way first of all through the smaller passages before reaching their hunting-grounds.

Before commencing operations each man in a gang provides himself with a bull's-eye lantern, a canvas apron, and a pole some seven or eight feet in length, having an iron attachment at one end somewhat in the shape of a hoe. For greater convenience, the lantern is invariably fixed to the right shoulder, so that when walking, the light is thrown ahead; and when stooping, its rays shine directly to their feet. Thus accoutred they walk slowly along through the mud, feeling with their naked feet for anything unusual, at the same time raking the accumulation from the walls and picking from the crevices any article they see. Nothing is allowed to escape them, no matter what its value, provided it is not valueless. Old iron, pieces of rope, bones, current coin of the realm, and articles of plate and jewellery—all is good fish which comes to the husher's net.

With 'finds' in the way of coins of course the 'humble penny' predominates. Sixpences and shillings, however, often increase the value of the collection; and at rare intervals—too rare to please the husher—half-sovereigns and even sovereigns are discovered. Like the flies in

amber, the mystery is how they got there. Among other articles of intrinsic worth, silver spoons are most often found, although shirt-studs, diamond rings, silver drinking-vessels, and many other quite-out-of-place articles swell the list from time to time. Lucky finds such as those above mentioned do not deter the husher from keeping a sharp lookout for less valuable articles as they float by. His 'eagle eye' from long practice is capable of judging the worth of the floating refuse before it would be even discernible to the ordinary observer. Mile after mile does the sewer-hunter traverse underground, until a tolerably heavy bag is a result of his labour. Night or day is all one to the husher. Some gangs enter the sewers at night and work on until morning, while others carry out the search only during the daytime. Rats abound everywhere, some of them being of enormous size, large enough to frighten any beginner at the game. The experienced husher, however, takes no notice of them; and the rats are only too pleased to sneak away in the darkness.

When a gang has done a fair day or night's work and leave the sewer, the first business is to sort and divide the spoil. The saleable goods, such as bones, rope, rags, &c., are disposed of to the marine-store dealer; and any articles of silver plate or jewellery are pledged. The proceeds are then added to any money found during the work, and the whole is equally divided among the gang. The average earnings, taking the year through, are about seven shillings per day each man, this sum being greatly exceeded if a man happens to join a 'lucky' gang. This peculiar line of business has not as yet suffered from over-competition.

SOMETIMES.

SOMETIMES, when life seems wonderfully dear,
When heart and spirit bound with untold mirth
For very gladness of our God-given birth,
And all the happinesses round us here;
When blossoms throng our pathway, skies are clear,
And loved and loving ones are by our side,
Until it seems in all the horizon wide
No touch of sorrow ever could appear;
Then sometimes, in a moment, at a word,
Some memory—a child's sad, lonely cry—
The mournful note of some wild stricken bird—
A look of anguish in some dumb thing's eye—
Will fill the heart with such a weight of grief,
That bitter tears alone will bring relief.

FEODORA BELL.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL.*
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

PRICE 1½d.

AUSTRALASIAN BANKS AND BRITISH DEPOSITS.

A LITTLE over forty-three millions of British money, the main portion of which comes from Scotland, is at present deposited with the banks in Australasia. This of itself forms sufficient reason why the depositor should know about these banks. But, in addition, there has been a severe crisis in the Antipodes; about fifty financial institutions, including so-called land banks, have toppled down, and in their fall have of necessity more or less involved the ordinary banks of issue. These, in fact, have suffered losses during the last seven years owing to failures and disasters, according to the estimate of the *Australasian Insurance and Banking Record*, of not less than four and a half millions sterling, and one has had to close its doors.

It is now three-quarters of a century since the first bank was established in Australia—namely, the Bank of New South Wales in 1817. The number of Australasian banks is now twenty-five with 1713 branches—a goodly number for a population of four millions. Many of the bank offices are palatial buildings, such, for instance, as the premises of the Australian Joint-stock Bank in Sydney, which are said to be the finest of the kind in the world. Some of the branch banks, however, are in small country townships consisting of collections for the most part of wooden shanties, where one would hardly think it worth while to set down a branch in the parent country. But they must surely pay or they would not be maintained, and they are easily abandoned if unprofitable. In the up-country branches, firearms are as indispensable an article of furniture as the coal-scuttle; and it is the duty of the Inspector on his periodical visits to see that the revolvers are in order and that a supply of ammunition is in hand. The country managers keep a horse at the bank's expense to visit the farmers, and are often at work in boots and breeches. So very different from the staid and decorously habilitated

banker of the home type! The banker's office hours are nine A.M. to five P.M. in the big towns. As to salaries, an officer of two years' standing usually gets sixty pounds; one of six or eight years' service may have from one hundred and fifty to one hundred and eighty pounds per annum.

Most of the Australasian banks have offices, and some of them head offices, in London; and certain of the banks have established what is termed a London Register. A London Register is a Register of Shareholders who have subscribed to an issue of shares in London. The shares on the London Register cannot be transferred to the Colonial Register, nor can shares on the Colonial Register be transferred to London. Australian bank shares command a higher price in the London market, usually ten per cent. more than the price ruling in the colonies. The reason for this is that the Antipodeans expect a better return for their capital. If an Australian bank wants to float an issue of shares here, it must open a London Register and obtain a quotation on the Stock Exchange to enable free dealings to take place in the shares. The shares on the Colonial Register are not negotiable here, and buyers or sellers in this country must appoint an attorney to act for them in the colony if they wish to operate.

A London Register does much to increase the prestige and influence of the bank adopting it in Great Britain. It is of importance also to found jurisdiction on in case of litigation. Depositors like to see the shares of the bank in which they are interested quoted in the newspapers, as it affords them an index—often the only one available to them—to the prosperity of the institution, and the consequent safety of their hoard. If a bank's shares stand at a good premium, it is fair to infer as a general rule that its credit is good and its position sound. A high price on the London Stock Exchange is at anyrate a very substantial argument.

But the London Register has its disadvantages. Troubles in the Antipodes, either personal to the

bank or resulting indirectly, have an instant influence on quotations, and set depositors thinking; whereas if there were no London Register, and consequently no quotation of shares, they would be in 'happy ignorance.' The heavy selling of shares and depression of price constitute a great source of danger to a bank. A case in point is the Agra and Masterman's Bank, which was wrecked in 1866 by Stock Exchange 'bears.' This led to the passing of Leeman's Act, which provided that a sale of bank shares shall be invalid unless the numbers of the shares are stated in the contract.

It may be asked, wherein lies the security to a depositor?—in the paid-up capital, the reserve fund, or the reserve liability? In our opinion, it is in all the three; yet the principal security is without doubt the reserve liability. An ample capital is a necessity; yet on how comparatively small a capital some of the Australian banks have been rearing a magnificent fabric of deposits. One bank with six hundred thousand pounds of paid-up capital has accumulated deposits, in this case gathered mainly in the colonies, to the extent of twelve millions, and pays a dividend of twenty-five per cent. The reserve funds of the Australian banks total a little more than half the amount of the paid-up capital. A reserve fund is very desirable as a security; it is the bank's absolute property; it consists of undivided profits; and it cannot be redemanded like deposit money. Yet there have been notable cases of failure on the part of banks possessing good reserve funds, such as the Cape of Good Hope Bank; and recent disclosures have led depositors to pay more attention to reserve liability, which is by far the most important security from their point of view. A very slight depreciation in assets will wipe out most reserve funds. In one bank which was ultimately amalgamated with another the depreciation was as much as twenty-five per cent. Take the case of a big bank with, say, a capital and reserve fund of one and a quarter million, and twelve millions of assets. A depreciation of ten per cent. in assets would absorb all its capital and reserve. Any one who knows the nature of bank assets, the stone and lime holdings, the advances on goods and stock, the expense of liquidation and of litigation, and the bad debts, knows that in times of forced realisation from shareholders and the bank's debtors there is unfortunately ample room for depreciation. But with a Register of Shareholders who are personally liable for a certain amount of reserved liability, the depositor should feel more secure. The amount is intact, that is, it cannot be drawn on save in the event of liquidation. The depositor should satisfy himself, however, that the shareholders are not 'dummies'—that is, fictitious persons—but that they have a real existence, and are more or less in credit.

The paid-up capital of the Australasian banks amounts to nearly sixteen millions; and the total capital liability—callable and reserved under charter—is about twenty-three and a half millions sterling. It appears that, in terms of the Acts of Incorporation under which most of the banks are constituted, the liability of the shareholders is limited to double the amount of their shares; and shareholders are made responsible to this extent in the interest of the bank's creditors,

who, if this provision had not existed, would otherwise have had no redress in the event of the assets of the banks failing to satisfy their claims. The bank with the greatest amount of capital liability is the Union Bank of Australia, which has a million and a half of paid-up, and three millions of callable capital. The Bank of Australasia has £1,600,000 paid up, and a reserve liability of like amount; and the Commercial Bank of Australia has a capital of three millions, of which £1,200,000 is paid up.

While on the subject of capital, we should mention a peculiar method adopted by one of the banks—the Union Bank of Australia—in the way of capitalising a portion of its deposit money. It has £750,000 of what it terms 'Inscribed Stock Deposits.' This Deposit stock is guaranteed a return of four per cent; but it can only be realised by sale on 'Change and on conditions defined by the bank. The object of establishing this stock was to obtain money which was not liable to be withdrawn, as is the case with ordinary deposits.

An additional security offered to depositors in the Melbourne banks is afforded in the fact, as stated in the Melbourne *Argus* of 29th March 1892, that, at a meeting of the associated banks, held on the previous day, it was resolved to announce: 'That the associated banks in Melbourne have agreed upon mutually satisfactory conditions, on which they will extend their joint support to any one of their number requiring it.' The names of the ten associated banks in Melbourne are as under: Bank of Australasia, Bank of Victoria (Limited), City of Melbourne Bank (Limited), Colonial Bank of Australasia, Commercial Bank of Australia (Limited), English, Scottish, and Australian Chartered Bank, Federal Bank of Australia (Limited), London Chartered Bank of Australia, National Bank of Australasia, Union Bank of Australia (Limited). One Sydney bank, the Bank of New South Wales, although not one of the associated banks in Melbourne, has joined in this alliance for mutual support. It was estimated a couple of years ago that these Victorian banks held among them somewhere from fifteen to twenty millions of British deposit money, and it is expected that in the other colonies, notably New South Wales, the banks there will similarly federate for self-protection to the benefit of the British depositor.

Another security offered to depositors consists in the opportunity which they have of insuring their bank deposits with companies transacting this class of business. For the benefit of intending insurers we may name several companies which are mentioned by the *Bankers' Magazine* of London—namely, the Mortgage Insurance Corporation, the Securities Insurance Company (Limited), and the Law Guarantee and Trust Society (Limited). These insure bank deposits, bonds, debts, and all classes of securities and investments, granting policies of insurance therefor at a premium usually of two shillings and sixpence per cent. Amongst other companies undertaking the guarantee of deposits are the Liverpool Mortgage Insurance Company, the Insurance Trust and Agency (Limited), and the Lancashire Trust and Mortgage Insurance Corporation. These companies appear to act on the doctrine of averages and to limit their risks in

each particular bank. They do not disclose what the amount of that risk is, nor do they publish the extent of their transactions, probably from the circumstance that this class of business is novel and tentative. As the premium of insurance is so small, there is much to be said in favour of thus insuring the repayment of deposits made with the weaker banks. If a bank gets into any discredit, the companies will either refuse to insure or raise their rates considerably. As much as fifteen shillings per cent. premium has been asked in a doubtful case. The underwriters at Lloyd's also bid for business of this kind, and they will insure the deposits of a bank in difficulties in the same way and at something approaching the same rates of premium as they charge for the insurance of a ship which is long overdue.

The Australasian banks allow no interest in the colonies on current accounts. On deposits for fixed periods, from three months to five years, rates are allowed varying from three to five per cent., as the case may be. These rates are fixed in the various colonies by agreement among the banks so as to keep down the evils of excessive competition. But the rates offered in this country to British depositors are not so regulated. Each bank fixes its own terms, which are entirely dependent on its money needs. If it has a plethora of deposits, it offers less inducement; but if it requires money, say, to float a colonial loan or make advances generally, it raises its rates to the British public accordingly.

The rates charged recently by the Australasian banks for advances averaged eight per cent. for overdrafts; and for discounts, nine to ten per cent. The advances of the Australasian banks amount to the large sum of about one hundred and forty-three millions to a population of four millions. A critic remarking on this, has asked: 'Is there one farmer in ten in any of these colonies who is not in debt for his land, or who has not obtained advances upon his growing crops? Is there one house in ten in Melbourne or Sydney, Adelaide, Brisbane, or Wellington, without a mortgage on it?' This leads us to remark how very different is the Australian banks' system of lending money from what it is in this country. Here we think it bad banking to lend on goods or material possessions, and only do so in very exceptional cases, personal security which can be turned into cash being much preferred. But in Australasia the security in the great majority of cases consists of mortgages on land, farms, and houses, especially in the country, it being the only security that country-people have. Then there are personal guarantees, also liens over stock, crops, wool, &c.

In regard to what are termed pastoral advances, the late Mr Brett said that it might fairly be assumed that fully two-thirds of 'all debts due to the banks' in Australasia were directly or indirectly based upon pastoral securities, connected with the occupation of grazing-land, which is mostly the unalienated property of the Crown. Wool is impledged by a document which confers a preferable lien over the wool in favour of the bank, fixes the rate of interest on the loan, and stipulates that the sheep shall be shorn and the wool delivered to, or sold for behoof of, the lending bank. If any of these conditions are not com-

plied with, the bank as lienee can take possession of the stock at any moment for such purpose.

It may be asked how the Australasian banks have managed to secure so much British deposit money, which, by the way, does not appear to be diminishing in amount, since it is stated in the *Australasian Banking Record* that an increase of three and a half millions in the total had taken place during the past year. It may be mentioned that the Australian money deposited with the banks in the colonies amounts to one hundred and ten millions. The popularity of British depositing with Australian banks is primarily due to the favourable conditions attaching to the deposit receipts, the interest on which is paid to the depositor by warrant issued half-yearly for the interest due, less the income tax. But the great success which deposit-seeking institutions have met with in Scotland is to be ascribed to the efforts of agents representing the banks, who, under the stimulus of a small commission of usually two shillings and sixpence per cent., gather in much deposit money. Investors ordinarily leave the disposal of their funds in the discretion of their factors and lawyers, and these gentlemen have been valuable allies to the Australian banks in this way. There is, moreover, a scarcity of secure investments, and the amount of money seeking investment is growing greater day by day.

The present crisis in Australia has been intensified by the speculative action of many of the land and building companies, or, as they misname themselves, 'land banks.' These and other financial companies have likewise drawn much deposit money through their agents here offering higher rates than the ordinary banks. The result of this influx of British money was to encourage a fictitious trading and operating in land. The constant tendency of land to rise in price proved tempting to many of the companies, who bought and mortgaged properties in order, by selling them again, to make money out of them. Land reached such inflated values that, in some cases, house property and land in the vicinity of Melbourne fetched higher prices than in the immediate neighbourhood of London. A period of inflation has been followed by a time of depression, and the present prices of town properties in those colonies affected by the land 'boom' are as much below the real value as they were formerly above it. Fortunately, the land 'boom' was to a great extent local, and its effects were not felt in all the colonies or in all parts of any one. Most of the banks are represented in several colonies; so, when trade is bad and losses are made in one colony, they may be reaping profits in another.

But although, through its association with land institutions as clients, banking in Australasia has suffered some losses, there can be no question as to the future of Australia as a whole. It has advanced with such leaps and bounds that its 'resistless march' cannot long be stayed. The largest island in the world, it is more than twenty-six times the size of the United Kingdom, more than fifteen times as large as France, more than half as large again as Russia in Europe, and almost equal in extent to the Continent of Europe, or to the United States of America. So says the Government Statist of New South

Wales, who adds that the British Empire extends over an area of 8,040,000 square miles, so that nearly two-fifths of its area is embraced within the limits of the seven colonies. In 1889 it had one hundred millions of sheep, nine and a half millions of cattle, one and a half million of horses, and more than a million of swine. The year's value of wool grown was twenty million pounds, of other pastoral produce fifteen millions, of agricultural produce twenty-five millions, and of dairy produce seven millions. The total capital value of pastoral property, including stock, freehold land, improvements, and plant, is four hundred and seventeen millions sterling.

Everywhere signs of the latest improvements are visible. Owing to the uncertain rainfalls and recurring droughts, tanks and wells have been dug in many places. In New South Wales alone four millions have been spent in the construction of tanks for large storage purposes. Even wire-fenced paddocks have been provided for the sheep. The railway lines which belong to Government extend to more than fifteen thousand miles. It is acknowledged that on these and other public works too much public money has been expended, and one result is that the present public debt of the colonies is nearly two hundred millions sterling. The interest on this will partly be met out of the large revenues derived from the Government railways and harbours, and partly from the industrial earnings of the community, and it is of importance that the credit of the country be maintained, so that the loans which fall to be renewed may be taken up at the same low rates as at present. And as the loans are frequently financed by the banks, the more credit that the colonies enjoy for financial and administrative power, the better will it be for the banks, whose wealth is bound up with that of the whole community.

BLOOD ROYAL.*

BY GRANT ALLEN,

Author of *In All Shades*, *This Mortal Coil*, &c.

CHAPTER VII.—AFFAIRS OF THE HEART.

THE return to Chiddingwick was a triumphal entry. Before seven o'clock that evening, when the South-eastern train crawled at its accustomed leisurely pace, with a few weary gasps, into Chiddingwick Station, Mr Plantagenet had spread the news of his son's success broadcast through the town, *via* the *White Horse* parlour. Already, on the strength of Dick's great achievement, he had become the partaker, at other people's expense, of no fewer than three separate brandies and sodas; which simple Bacchic rites, more frequently repeated, would have left him almost incapable of meeting the hero of the hour with suitable effect, had not Maud impounded him, so to speak, by main force after five o'clock tea, and compelled him to remain under strict supervision in the domestic jail till the eve of Dick's arrival.

Dick jumped out, all eagerness. On the platform, his mother stood waiting to receive him, proud but tearful, for to her, good woman, the glories of the Plantagenet name were far less a

matter of interest than the thought of losing for the best part of three years the mainstay of the family. Maud was there, too, beaming over with pure delight, and even prouder than she had ever been in her life before of her handsome brother. Mr Plantagenet himself really rose for once to the dignity of the occasion, and instead of greeting Richard with the theatrical grace and professional flourish he had originally contemplated, forgot in the hurry of the moment the high-flown speech he had mentally composed for delivery on the platform, and only remembered to grasp his son's hand hard with genuine warmth as he murmured, in some broken and inarticulate way: 'My boy, my dear boy, we're all so pleased and delighted to hear it.' He reflected afterwards with regret, to be sure, that he had thrown away a magnificent opportunity for a most effective display by his stupid emotion; but Dick was the gainer by it. Never before in his life did he remember to have seen his father act or speak with so much simple and natural dignity.

All Chiddingwick, indeed, rejoiced with their joy. For Chiddingwick, we know, was proud in its way of the Plantagenets. Did not the most respectable families send their children to take dancing lessons at the *White Horse* Assembly Rooms from the disreputable old scamp, on the strength of his name, his faded literary character, and his shadowy claim to regal ancestry? The station-master himself, that mighty man in office, shook hands with 'Mr Richard' immediately on his arrival; the porters presented him with a bouquet of white pinks fresh plucked from the Company's garden; and even Mr Wells raised his hat to his late assistant with full consciousness of what respect was due from a country tradesman to a gentleman who had been admitted with flying colours to 'Oxford College.' Dick's progress up the High Street was one long shaking of many friendly hands; and if that benevolent soul, Mr Trevor Gillingham, of Rugby School, could only have seen the deep interest which his rival's success excited in an entire community, he would have felt more than ever, what he frequently told all his Sixth Form friends, that he was glad he'd been able 'practically to retire' in favour of a young man so popular and so deserving.

And then, after the first flush of delight in his victory had worn off, there grew up in Richard's mind the more practical question of ways and means: what was he to do with his time in the interval, till term began in October? Neither his father nor Mr Wells would hear of his returning meanwhile to his old employment.

'No, no, Dick—Mr Richard, I mean,' the good bookseller said seriously. 'For your sake and the business's, I couldn't dream of permitting it. It's out of place entirely. A scholar of Durham College, Oxford, mustn't soil his hands with waiting in a shop. It wouldn't be respectable. No self-respecting tradesman can have a gentleman in your present position standing behind his counter. I call it untradesman-like. It's calculated to upset the natural and proper relations of classes. You must look out for some work more suited to your existing position and prospects; and I must look out for an assistant in turn who ain't a member of an ancient and respected university.'

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

Dick admitted with a sigh the eternal fitness of Mr Wells's view; but at the same time he wondered what work on earth he could get which would allow him to earn his livelihood for the moment without interfering with the new and unpractical dignity of a Scholar of Durham College, Oxford. He had saved enough from his wages to eke out his Scholarship and enable him to live very economically at the university: but he must bridge over the time between now and October without trenching upon the little nest-egg laid by for the future.

As often happens, chance stepped in at the very nick of time to fill up the vacancy. At the rectory that night, Mr Tradescant was talking over with his wife the question of a tutor for their eldest son, that prodigiously stupid boy of seventeen—a pure portent of ignorance—who was to go in for an army examination at the end of September. 'No, I won't send him away from home, Clara,' the rector broke out testily. 'It's no earthly use sending him away from home. He's far too lazy. Unless Arthur's under my own eye, he'll never work with any one. Let me see, he comes home from Marlborough on the 28th. We must get somebody somehow before then who'll be able to give him lessons at home, if possible. If he has two months and more of perfect idleness, he'll forget all he ever knew (which isn't much), and go up for examination with his mind a perfect blank, a *tabula rasa*, a sheet of white note-paper. And yet, unless we get a tutor down from town every day—which would run into money—I'm sure I don't know who the—person is we could possibly get to teach him.'

Mary Tudor was sitting by; and being a very young and inexperienced girl, she hadn't yet learned that the perfect governess, when she hears her employers discuss their private affairs, should behave as though her ears were only for ornament. (And Mary's, indeed, were extremely ornamental.) So she intervened with a suggestion—a thing no fully-trained young woman from a modern Agency would ever dream of doing. 'There's that Plantagenet boy, you know, Mrs Tradescant,' she remarked, without bearing him the slightest grudge for his curious behaviour over the bookbinding incident. 'He's just got a Scholarship at Oxford to-day, Mr Wells was telling me. I wonder if he would do? They say he's a very clever, well-read young fellow.'

The Reverend Hugh received the suggestion with considerable favour. 'Why, there's something in that, Miss Tudor,' he said, leaning back in his easy-chair. 'I'm glad you thought of it. The young man must be fairly well up in his work to have taken a Scholarship—a very good one, too, a hundred a year, at my own old college. I met Plantagenet this afternoon in the High Street, overflowing with it.—This is worth looking into, Clara: he's on the spot, you must bear in mind; and under the circumstances, I expect, he'd be in want of work, and—willing, I daresay, to take extremely little. He can't very well go back to Wells's, don't you see; and he can't afford to live at home without doing something.'

'The boy's as mad as a March hare, and not a very desirable companion for Arthur, you must feel yourself,' Mrs Tradescant answered, a little chillily, not over well pleased with Mary for

having ventured to interfere in so domestic a matter. 'And besides, there's the old man! Just consider the associations!'

'Well, he can't help being the son of his father,' the rector replied with a man's greater tolerance. 'He was born with that encumbrance. And as to companions, my dear, young Plantagenet's at anyrate a vast deal better than Reece and the groom, who seem to me to be Arthur's chief friends and allies whenever he's at home here. The boy may be mad, as you suggest: I daresay he is: but he's not too mad to get a Durham Scholarship; and I only wish Arthur had half his complaint in that matter. A fellow who can take a Scholarship at Durham's no fool, I can tell you. I'll inquire about his terms when I go into town to-morrow.'

And the Reverend Hugh did inquire accordingly, and found Dick's attainments so satisfactory for his purpose that he forthwith engaged the new scholar as tutor for Arthur, to come five days in the week and give four hours' tuition a day till the end of September, at a most modest salary, which to Dick nevertheless seemed as the very wealth of Croesus. Not till long after did Dick know that he owed this appointment in the first instance to a chance word of Mary Tudor's. Nor did Mary suspect, when out of pure goodness of heart and sympathy for a deserving and struggling young man she suggested him for the appointment, that his engagement would be the occasion of throwing them too much together in future.

So luck would have it, however. Five days a week, Dick went up with his little strapped parcel of books to the rectory door, to engage in the uncongenial and well-nigh impossible task of endeavouring to drive the faint shadow of an idea into Arthur Tradescant's impenetrable cranium. It was work, hard work—but it had its compensations. For quite insensibly to both at first, it brought Dick and Mary a great deal into one another's society at many odd moments. In the very beginning, it is true, they only met quite by accident in the hall and passages or on the garden path; and Mary rather shrank from conversation with the young man who had been the hero of that curious episode about the binding of the Flora. But gradually the same chance threw them more and more into contact; besides, their relative positions had been somewhat altered meanwhile by Dick's success at Durham. He was now no longer the bookseller's young man, but a student who was shortly to go up to Oxford. This told with Mary, as it tells with all of us, almost without our knowing it. We can seldom separate the man from the artificial place he holds in our social system. Indeed, the very similarity of their positions in the household—his as tutor and hers as governess—made to some extent now a bond of union between them. Before many weeks were out, Mary had begun to look for Dick's pleasant smile of welcome when he arrived in the morning, and to see that the strange young man, whose grave demeanour and conscious self-respect had struck her so markedly that first day at Mr Wells's, had really after all a great deal in him.

The more Dick saw of Mary, too, the better he liked her. Just at first, to be sure, his impulse had been a mere freak of fancy, based on the

curious coincidence of their regal names; that alone, and nothing else, had made him think to himself he might possibly fall in love with her. But after a while the mere fancy counted for comparatively little; it was the woman herself, bright, cheery, sensible, that really attracted him. From the very beginning he had admired her; he soon learned to love her; and Mary for her part found it pleasant, indeed, that there was somebody in this social wilderness of Chiddingwick who genuinely cared for her. A governess's lot is as a rule a most lonely one, and sympathy in particular is passing dear to her. Now Dick was able to let Mary feel he sympathised with her silently in her utter loneliness; and Mary grew soon to be grateful to Dick in turn for his kindness and attention. She forgot the handsome shopman with the long yellow hair in the prospective glories of the Durham undergraduate.

The summer wore away, and the time drew near when Richard must begin to think about his preparations for going up to Oxford. A day or two before the date fixed for the meeting of the colleges, he was walking on the footpath that runs obliquely across the fields which stretch up the long slope of the hill behind Chiddingwick. As he walked and reflected, he hardly noticed a light figure in a pretty print dress hurrying down the hillside towards him. As it approached, he looked up; a sudden thrill ran through him. It was Mary who was coming! How odd! He had been thinking about her that very moment! And yet not so odd, either; for how often he thought about her! He had been thinking just now that he couldn't bear to leave Chiddingwick without telling her how much she had lately become to him, and how very, very deeply he regretted leaving her. His face flushed at the sight and the thought; it seemed to him almost like an omen of success that she should happen to come up at the very moment when he was thinking such things of her. It was so unusual for Mary to go out beyond the rectory grounds by herself; still more unusual for her to be coming home alone so late in that particular direction. He raised his hat as she approached. 'Oh, Miss Tudor,' he cried shyly, with a young man's mixture of tinidity and warmth, 'I'm so glad to see you here. I—I was just thinking about you. I want to have a talk with you.'

'And I was just thinking about you,' Mary answered more frankly, with a scarcely perceptible blush—the charming blush that comes over a good girl's face when she ventures to say something really kind and sympathetic to a man she cares for. 'I was thinking how very soon we're going to lose you.' And as she said it, she reflected to herself what a very different young man this pleasant intelligent Oxford scholar seemed to her now from the singular person who had insisted, three months back, on putting her monogram with the Tudor rose on the *British Flora*!

'No, were you really?' Dick cried, with a glowing cheek, much deeper red than her own. 'Now that was just kind of you. You can't think how much pleasanter and happier in every way you've made my time at the rectory for me.' And he glanced down into her liquid eyes with grateful devotion.

'I might say the same thing to you,' Mary answered, very low, hardly knowing whether it was quite right of her even to admit such reciprocity.

Dick's face was on fire with ingenuous delight. 'No, you can't mean to say that?' he exclaimed, a delicious little thrill coursing through him to the finger-tips. 'Oh, how very, very kind of you!' He hesitated a moment; then he added with a tremor: 'You needn't walk so fast, you know. I may just turn round and walk back with you, mayn't I?'

'I don't quite know,' Mary answered, looking round her, a little uncertain. She didn't feel sure in her own heart whether she ought to allow him. He was a very nice fellow, to be sure, and she liked him immensely, now she'd got to know him; but would Mrs Tradescant approve of her permitting him to accompany her? 'Perhaps you'd better not'—she faltered again—but her lingering tones belied her words. 'I'm—I'm in a hurry to get home. I really mustn't wait a minute.'

In spite of what she said, however, Dick continued—just like a man—to walk on by her side; and Mary, it must be admitted by the candid historian, took no great pains to prevent him. 'I'm so glad you say you'll miss me, Miss Tudor,' he began timidly, after a very long pause—oh, those eloquent pauses! 'For I too shall miss you. We've seen so much of each other, you know, these last six or eight weeks; and it's been such a pleasure to me.'

Mary answered nothing, but walked on faster than ever, as if in particular haste to return to the rectory, where they were really awaiting her. Still, a great round spot burned bright red in her cheek, and her poor throbbing heart gave a terrible flutter.

Dick tried to slacken the pace, but Mary wouldn't allow him. 'Do you know,' he went on, glancing down at her appealingly, 'it may seem a queer thing to you for a fellow to say, but until I met you, my sister Maud was the only girl I'd ever met whom I could consider—well—my equal.'

He said it quite simply, with all the pride of a Plantagenet; and as he spoke, Mary felt conscious to herself that whatever else Dick might be, after all he was a gentleman. Yes, and in spite of old Mr Plantagenet's many obvious faults, a descendant of gentlemen too; for even in his last disreputable and broken old age, traces of breeding still clung about the Chiddingwick dancing-master. Mary instinctively understood and sympathised with the poor lad's feeling. She spoke very softly. 'I know what you mean,' she said, 'and I can understand it with you. I've met your sister—at—the *White Horse*, and I felt, of course'—She checked herself suddenly. She had just been going to say, 'I felt she was a lady,' but instinct taught her at once how rude and pretentious the expression would sound to him; so she altered her unspoken phrase to, 'I felt at once we should have a great deal in common.'

'I'm so glad you think so,' Dick murmured in return, growing fiery red once more, for he knew Mary was accustomed to accompany the rectory children to the Assembly Rooms' dancing lessons, where Maud often helped her father with her violin; and he couldn't bear to think she should

have seen the head of the house engaged in such an unworthy and degrading occupation. 'Well, I was just going to say, you're the only girl I ever met in my life with whom I could speak—you know what I mean—why, just speak my whole heart out.'

'It's very kind of you to say so,' Mary answered, beginning to walk much faster. She was really getting frightened now what Dick might go on to say to her.

'And so,' the young man continued, floundering on after the fashion of young men in love, 'I—I shall feel going away from you.'

Mary's heart beat fast. She liked Dick very much, oh, very much indeed; but she didn't feel quite sure it was anything more than liking. (Women, you know, make in these matters such nice distinctions.) 'You'll meet plenty of new friends,' she said faintly, 'at Oxford.'

'Oh, but that won't be at all the same!' Dick answered, trembling. 'They'll all be men, you see.' And then he paused, wondering whether perhaps he had spoken too plainly.

Mary's pace by this time had become almost unlady-like, so fast was she walking. Still, just to break the awkward silence which followed Dick's last words, she felt compelled to say something. 'You'll meet plenty of girls, too, I expect,' she interposed nervously.

'Perhaps; but they won't be *you*,' Dick blurted out with a timid gasp, gazing straight into her eyes; and then recoiled, aghast, at his own exceeding temerity.

Mary blushed again and cast down her eyes. 'Don't let me take you out of your way any farther,' she said after another short pause, just to cover her confusion. 'I really must get back now. Mrs Tradescant'll be so angry.'

'Oh, no; you can't go just yet,' Dick cried, growing desperate, and standing half across the path, with a man's masterful eagerness. 'Now I've once begun with it, I must say my say out to you.—Miss Tudor, that very first day I ever saw you, I thought a great deal of you. You could tell I did by the mere fact that I took the trouble to make such a fool of myself over that unhappy book-cover. But the more I've seen of you, the better I've liked you. Liked you, oh, so much, I can hardly tell you. And when I went up to Oxford about this Scholarship, which has given me a start in life, I thought about you so often that I really believe I owe my success in great part to you. Now, what I want to say before I go—he paused and hesitated; it was so hard to word it—'what I want to say's just this. Perhaps you'll think it presumptuous of me; but do you feel, if I get on, and recover the place in the world that belongs by right to my family,—do you feel as if there's any chance you might ever be able to care for me?'

He jerked it out, all trembling. Mary trembled herself, and hardly knew what to answer; for though she liked the young man very much—more than any other young man she'd ever yet met—she hadn't thought of him to herself in this light exactly—at least not very often. So she stood for a moment in the corner of the path by that bend in the field where the hedge hides and shelters one, and replied diplomatically, with sound feminine common-sense, though with a quiver in her voice: 'Don't you think, Mr Plan-

tagenet, it's a little bit premature for you to talk of these things when you're only just going up to Oxford? For your own sake, you know, and your family's too, you ought to leave yourself as free and untrammelled as possible: you oughtn't to burden yourself beforehand with uncertainties and complications.'

Dick looked at her half reproachfully. 'Oh, Miss Tudor,' he cried, drawing back quite seriously, 'I wouldn't allow anybody else in the world to call you a complication.'

He said it so gravely that Mary laughed outright in spite of herself. But Dick was very much in earnest for all that. 'I mean it, though,' he went on, hardly smiling to himself. 'I mean it, most literally. I want you to tell me, before I go up to Oxford, there's still some chance, some little chance in the future for me. Or at anyrate I want to let you know what I feel, so that—well, so that if anybody else should speak to you meanwhile, you will remember at least—and'—He broke off suddenly. 'Oh, Miss Tudor,' he cried once more, looking down at her with a mutely appealing look, 'it means so much to me!'

'You're very young, you know,' Mary answered, with a good woman's subterfuge, half to gain time. 'I think it would be very foolish, both for you and me, to tie ourselves down at our present ages. And besides, Mr Plantagenet'—she played with her parasol a moment—'I don't want to hurt your feelings, but I'm not quite sure—whether or not I care for you.'

There was a tremor in her voice that made her words mean less than they seemed to mean; but she felt it too. This was all so sudden. Nevertheless, Dick seized her hand. She tried to withdraw it, but couldn't. Then he began in eager tones to pour forth his full heart to her. He knew he had no right to ask, but he couldn't bear to go away and leave the chance of winning her open to some other fellow. It must be for a very long time, of course; but still he could work better if he knew he was working for her. He didn't want her to say *yes*; he only wanted her not quite to say *no* outright to him. This, and much else, he uttered from his heart with rapidly developing eloquence. He was so glad he'd met her, for he couldn't have left Chiddingwick without at least having spoken to her.

To all which Mary, with downcast eyes, very doubtful—though she liked him—whether it was quite right for her to talk in this strain at all to the dancing-master's son, replied demurely that 'twas all very premature, and that she didn't feel able to give him any answer of any sort, either positive or negative, till they had both of them had more time to look about them.

'And now,' she said, finally, pulling out her watch and starting, 'I really mustn't stop one moment longer. I must go back at once. It's dreadfully late. I'm sure I don't know what Mrs Tradescant will think of me.'

'At least,' Dick cried, standing half in front of her yet again, and blocking up the pathway, 'you'll allow me to write to you?'

Yes, Mary thought, yielding, there'd be no harm in that: no objection to his writing.

Dick gave a little sigh of heartfelt satisfaction. 'Well, that's something!' he cried, much relieved. 'That's always something! If you'll allow me

to write to you, I shall feel at anyrate you can't quite forget me.'

And indeed, when a girl lets a young man begin a correspondence, experience teaches me, from long observation, that other events are not unlikely to follow.

ENAMELS.

LIMOGES, the modern capital of the French department of Haute-Vienne, the ancient capital of the Lemovices, and the mediæval capital of the Limousin, gave its name in the middle ages to one of the most beautiful of arts, and one which was very extensively practised in Limoges. The art of Enamelling is indeed very ancient in Europe. Gaulish ornaments have been found that show that at the time of the Roman occupation the principle of applying transparent vitreous matter over metal was known. But the only colour employed was red. In the Frank and Merovingian epoch a good deal of ornament was done by enamelling gold or silver. The splendid mosaic-work of the Byzantine artists had impressed the imagination of the Franks, and they attempted, not by any means rudely, to adapt mosaic-work to personal ornament, and to combine with it the method of vitrifying the coloured compounds over the metal they desired to enrich.

But the great age of enamels began in Europe in the twelfth century, when the term by which enamelling was known was 'Opus Limogiæ, labor de Limogia,' Limoges being considered as the great centre of the manufacture.

Long before, however, Limoges had been famous for its jewellers, and it was but a short stride from encrusting gold with precious stones to encrusting it with vitrified paste. St Eligius was a native of a village in the Limousin, and worked as apprentice to a goldsmith in Limoges, who was also Master of the Mint there. About 600 A.D. he went to Paris, and was placed with Bobbo, Treasurer to Clothair II. The king wanted a throne made of precious metal, and probably enamelled, for no one was found in Paris who knew how to do the work desired, and the task was confided to Eligius. Eligius found he had sufficient silver to make two seats. When they were done, he gave one to the king, who greatly admired it, and ordered another. Then Eligius produced the second throne. The king was so struck with his honesty that he immediately advanced him to be Master of the Mint, and gave him his entire confidence. After Dagobert succeeded to the throne, Eligius continued in his office, and occupied himself as well in hammering out gold and enamelled vessels for his master. Some specimens of his handiwork have been preserved. He was elected and ordained Bishop of Noyon in 640, and died in 659. The Abbey of Chelles possessed in the seventeenth century a large chalice that Eligius had wrought; and though this was destroyed at the Revolution, a description left of it leaves no doubt that it was richly enamelled. Other workshops for enamels were founded, one at Treves; another, under Bishop Bernward, at Hildesheim; later on, Cologne endeavoured to rival Limoges in the production of enamels.

Of enamels there are two sorts, entirely distinct. The first are the encrusted enamels, and the second are the painted enamels. Enamelling consists in applying to a metal surface a powder composed of pounded silice—or to put it in the simplest form, of glass coloured with metallic oxides, and then fixed by fire. Thus it is obvious that the transition was easy from letting coloured glass into gold or silver settings to melting the glass into its place so that it adhered at the back. The earliest enamels tell their own story—they are 'cloisonné,' that is to say, precisely as jewels were set in a framework of metal, so frameworks of metal were fashioned to contain the glass melted into these cells. This was the construction of 'cloisonné' enamel: first of all a fine band of gold was soldered on to the base, standing up from it at right angles, and contorted to form an outline such as was desired to be given to the ornamentation. If green was to be the colour for leaves, then each leaf was formed of the band and closed to contain the green. Each petal of a red rose would in like manner be enclosed so as to form a gold pocket in which the red paste would be melted into glass. Specimens of cloisonné enamel of European manufacture are rare; the Louvre collection comprises hardly more than one example, but that is a magnificent one, the cover of a book of the Gospels.

The jewel of King Alfred is in cloisonné work, probably of Byzantine manufacture, for the Anglo-Saxon jeweller who mounted it covered the enamel with a plate of glass as something very rare and precious. The earliest specimens are certainly Byzantine; such is the iron crown given to the Cathedral of Monza by Queen Theodelinda, who died in 625; such also the votive crown in the Treasury of St Mark's, Venice, on which is represented Leo the Philosopher, who died in 911. The fine reliquary at Limburg on the Lahn was brought there from Constantinople by a crusader. It had been executed for Basil II. before 976. The golden altar front at San Ambrogio, at Milan, which is also decorated with cloisonné enamel, is Byzantine, and dates from 825. All these enamels were the work of Byzantine artists, and are all framed by fine ribbons of gold. It is known that so late as the eleventh century, Desiderius, Abbot of Monte Cassino, in Italy, was obliged to send for workmen from Constantinople to fashion an altar frontal for him in coloured glass on metal, which was to represent the legend of St Benedict. However, the treatise of the monk Theophilus, who lived about that same time, either in Lombardy or in Germany, describes the manner of decorating gold and silver work by means of enamel set in the cloisonné fashion, so that though in Southern Italy there may have been no enamellers, this was not the case in the northern parts of Europe. In fact, at Essen, in Germany, there are still preserved some most interesting enamels of this description made in Germany for Mathilda, the Abbess of Essen, who ruled that convent between 974 and 1013. As an inscription on it names her brother Otho, Duke of Swabia, who died in 982, the enamel cannot be of a later date.

Cloisonné work was also called 'émail de plique,' from the folds formed by the fine gold ribbon that enclosed the several coloured glasses.

As may be supposed, this was a somewhat clumsy proceeding; only very flat surfaces could be so treated, and the back plate had to be thick and solid, that there might be no parting at the joints. A further advance was made by the adoption of 'champlevé' enamelling. Again the artists were led on to this development by the easiest transition. It occurred to them that they would gain all the same effect at far less cost of time and patience, if, instead of soldering a series of pockets on to the surface of metal, they removed such portions of the surface as they desired to ornament with colour, dug out pockets, and then filled these little pits with the enamel. Thus the artists were able to decorate rounded surfaces, and were no longer confined to such as were flat. In a church near Limoges is an eucharistic dove of copper gilt, standing on a plate. The wings have been scooped out in parallel lines, and coloured paste let in to represent the feathers of rainbow tint. So also the disc on which the dove stands, and the plumage of the back are enamelled by colours dropped into sunken receptacles.

Now the enamellers found that some of their colours were transparent, others were opaque. Their greens and reds and blues were of the former description; but white, yellow, and turquoise were opaque. This gave great variety and beauty. The deeper the engraving of the metal the intenser the depth of colours of the translucent enamel; consequently, it was possible to give to drapery a wonderful intensity of darkness in shadow and of brilliancy in lights where the gold ground shone through the shallow glass. Thus came into use, chiefly if not exclusively in Italy, the translucent enamels, of which a few superb examples remain, notably at Orvieto. But in champlevé enamel as ordinarily practised in France and Germany we have opaque and transparent colours employed side by side with charming effect.

The metal disc that was to be enamelled was treated both with hammering into relief and cutting out of the surface with the chisel, sinking for enamels, whereas the human figure was usually raised in relief. Thus treated, the figures were of copper gilt, and the enamel-work served as a background to throw them up. Every colour is surrounded with a thin rim of metal, that is the surface uncut away.

The champlevé enamel held its own till the end of the fifteenth century; but already, towards the later half of that century, a third modification of the art came in: it was that of painted enamels. In this new form assumed by the art the entire surface was covered over with a coating of white, black, or deep blue, and the subjects were painted thereon, the transparent colours floated over the white, and white laid film on film over the black. Finally, the whole was in many cases touched up with gold. To heighten effect, gold or silver foil was introduced under the transparent colours for dresses, giving a tinselly appearance, very inferior to the splendour produced by varying depth of cutting under the enamel.

The reason why painted enamels came in was that in the sixteenth century there was a great accession of wealth and influx of the precious metals into Europe. Hitherto, gold had been rare,

and the great monasteries, cathedrals, and parish churches had been content with copper-gilt ornaments and vessels, and these had been enriched artistically with enamels; but when gold became more common, then the great churchmen and the nobles as well exchanged their copper-gilt vessels for those of the most precious metal, and these latter they did not care to have overlaid with colour. Accordingly, the art of the enameller was threatened with extinction. The transformation of the art saved it. The metal was employed as a mere panel on which to paint a subject.

When the ground was black, a light film of white was washed over it, except in such points as were to be left black; this was subjected to fire and fixed; then the plate was again treated with another coating of white of still less extension; and finally a subject was produced in 'grisaille'—that is to say, in white of various shades from high pure white down to faint gray. If the finger be passed over the surface of these grisaille paintings, it is sensible of the elevation of the lights. As many as twenty or thirty of these coats are often superposed. Finally, the grisaille painting was either left as it was, a study in black and gray and white, or was washed over with transparent colours.

The most beautiful work of all is almost certainly the plain grisaille with just the faces and hands put in in colour and with the use of gold to touch it up. There are plates representing the several seasons, rose-water dishes and cruet, candlesticks, &c., in grisaille that are marvels of renaissance beauty. The Louvre and the Hôtel de Cluny at Paris contain great collections.

At Limoges, families arose, the Limosins, the Penicauds, the Reynauds, the Courteys, the Laudins, the Nouaillers, which became illustrious, and whose works of art are now eagerly sought after and bought at a price beyond their weight in gold. In 1890 a portrait by Leonard I. Limosin representing Louis de Gonzaga sold for ninety-seven thousand francs. There are several magnificent portraits by this artist in the Louvre, amongst them Francis II., Henry II., the Constable Anne de Montmorency, and Melanchthon.

But the process of laying layer upon layer of white, and subjecting the plate to fire after each, was vastly laborious and risky, and necessarily the cost was very great. This process was accordingly abandoned for hatching in the shadows with black. The effect is immeasurably inferior, but it rendered the enamels cheaper, and the artist had finally to struggle against the introduction and spread of porcelain. Faience was nothing but enamelling on earthenware; and earthenware whitened and decorated on its glazed white surface everywhere thrust out the costly copper dish and ewer, chandelier, and salt-cellar.

It is somewhat melancholy to watch the end of the struggle under the Nouaillers, who turned out vast quantities of enamel of very little artistic value and of little beauty at a low price, and finally gave up the contest. Nevertheless, enamelling continued to the beginning of the present century; it was resorted to mostly for portrait-painting and miniatures in brooches. Recently it has somewhat revived, and furnaces have been relighted at Limoges, where some beautiful work is now done, which is happily in considerable

demand. The art is one very easy of acquisition, and which may be practised by any one in his own home if he can devote for the purpose two small rooms, one as studio, the other for the necessary furnaces. And enamel-work sells. It is in request for brooches and personal ornaments. Large subjects, vases for the chimney and candlesticks, are in less demand; and an enameller in Limoges told the writer that he had abandoned the making of articles that were necessarily costly; but that of small enamels costing not more than five to sixteen pounds he could sell as fast as he made. Would it not be well for ladies in quest of a remunerative occupation to take up this beautiful art?

IN SEVEN CHAPTERS.

CHAPTER I.—LUCY.

And ye shall walk in silk attire,
And siller hae to spare,
Gin ye'll consent to be his bride.

A COLD day early in March, with a cruel, north-east wind blowing, and a few scattered snowflakes falling out of a leaden sky.

'Cold, ain't it?' the women said as they met at the corners of the streets, and drew up their shawls over their heads and hurried on, not even waiting for the little bit of gossip which, as a rule, caused them to ignore all other considerations, such as urgent business, crying baby, swearing husband, kettle boiling over, or even a sharp shower of rain.

But a north-east wind dulls even the appetite for gossip, and when the mill-bell rang at twelve o'clock, and the hands turned out for dinner, they did not linger round the gate or at the corner of Mill Lane, as their usual custom was, but went running off with their arms rolled up in their aprons, and the corners of the little shawls they wore over their heads in their mouths, to keep the wind from making its cold, penetrating way under them.

And yet there was more to be talked about that day than was the case generally, for report said that Mrs Craddock, the wife of the mill-owner, was dying. 'She as used to be Lucy Coles,' the mill-girls would have added; for only eighteen months before she had been one of the hands, running home to dinner just as they were doing now, with a shawl over her curly hair, and quite up for a long slide on a piece of ice where the water had frozen in the gutter.

A pretty, silly, little thing was Lucy Coles—a bit giddy, the folks said—and only kept straight by steady, sober-sided Alice Reynolds, who looked after her as sharp as an old hen after her one chick, and kept off the lads who would have come after Lucy's pretty face. A regular born old maid, the girls called Alice Reynolds; and they said it was a shame (that it was!) of her to keep Lucy out of all the fun.

And sometimes Lucy herself would rebel, and go off with a noisy party down to the town meadows, when there was a steam roundabout or

some shows down there, or would follow along the street with the other giddy ones when the militia marched through the town. But these rebellious fits did not last long, and she would soon come running back and fling her arms round Alice's neck, and kiss away the cloud on her kind, plain face, and with it the heartache of anxiety that always set in when Lucy was out of sight.

Mr Craddock, the mill-owner, was a middle-aged man, with a grave, severe, and somewhat surly manner, which awed the impudence out of the girls, and silenced the chatter of tongues directly he came in sight. He lived with his old mother in a house adjoining the mill, and instead of employing an overseer, as most of the other mill-owners did, saw to it all himself, and was constantly about in the mill or in the little office by the door.

'And I wish he wouldn't,' the girls said. 'As sure as ever there's a bit of larking, there he comes! He's all over the shop! Why can't he be like Dobson down town, as leaves it all to that foreman, and only comes in nows and thens in lavender kids and patent leathers. My! ain't he a masher?'

But, in the long run, the girls agreed that Craddock was not such a bad sort for a master. He was very fair, if he was a bit hard, and fairness is a quality which inspires respect, and wears better than generosity. And there was never a word of scandal against him; and that is saying a great deal for a man in a country town where gossip spares neither youth nor age, poverty nor riches.

Whether it was his little sharp-eyed mother, or his own surly manners, that procured him this immunity, I do not know; but certainly there was not another man, old or young, in Felsby, who could have stood so often by Lucy Coles's loom and kept her nearly every Saturday, on one excuse or another, for a few minutes' chat in the office, without setting all the tongues in the mill wagging, and a good many outside it.

Not even Alice Reynolds noticed it, or, at anyrate, noticed anything remarkable about it; and if she ever thought about it at all, set it down rather to his dissatisfaction with the girl's want of skilfulness in her work. And when she had waited for Lucy outside the office on pay day, she would try and devise in her wise, little head what she should do if Lucy got her leave, and whether, by strictest economy, she could keep them both out of her earnings.

It had really come to that, she felt sure one day, when she had been kept waiting longer than usual in the mill-yard, till all the girls had scattered and the foggy evening had stolen on, making Alice's shawl seem more thin and threadbare than she had reckoned it, when she had decided that it would last another year, and that Lucy must have a new jacket. And this conviction was strengthened when Lucy came out with a slow step, quite unlike the run and bound with which she generally came down the few steps, throwing her arm round Alice's waist and spinning her round, and making that staid, little, old-maidish person go prancing off in a sort of gallopade step.

And when she caught a glimpse of Lucy's face under the gas-lamp at the gate, and saw that

* Copyright 1892 in the United States of America by Roberts Brothers.

it was troubled and grave, that the eyes were wide and frightened, and the pretty, little mouth drawn into thoughtful lines, she never doubted what had happened; but tucked her hand under the girl's arm, and set off briskly home through the fog, proposing that they should go to the reckless extravagance of sausages for supper.

Lucy said nothing till they got out of High Street and turned into Grape Gardens where their lodging was, and which was not important enough to have a gas-lamp allowed it, and so was in darkness, except where here and there an open door or uncurtained window threw some warm light on to the fog; but Alice could feel the girl's heart beating with great throbs against her hand, and she thought it was all from the pain of being turned off.

'Alice,' at last Lucy burst out, 'I've got something to tell you.' She stopped as she spoke, and drew Alice in front of her, laying her hands on her friend's shoulders, and bending her face down close to hers, for Lucy was a good bit the taller.

'Tell me? Why, bless the girl! do you think I don't know? And there! it ain't nothing to trouble about! I've a-seen it coming this ever so long.'

'Have you?' Lucy answered. 'Well, you've been sharper than me, then, for when he asked me just now, it struck me all of a heap, and I didn't a bit know what to say.'

'There weren't much to be said anyway, as I can see, but just "thank you," and come away. I don't hold with begging and praying to be kep' on; it don't do no good.'

'Kep' on?'

'Yes. That's about it, ain't it? as you've got the sack.'

Lucy gave a long laugh, and shook the small, thin shoulders her hands were holding.

'No, it ain't; you're just wrong: you ain't so clever after all. Got the sack! No, it will be me giving the sack to any one as don't please me. Kep' on, indeed! I shan't need to touch a shuttle again, and I'll just dip my hand in the strong-box and help myself when I want some money.'

'What?'

'Ay, you may well say what? I said it when he asked me to marry him.'

'Who?'

'Why, Craddock, the master. There! you needn't wriggle them shoulders and sniff that way. Gentle folks' courting ain't a bit like ours, leastways his ain't. I'd never a-known what he meant by it. He hardly as much as looked at me, but got as red as anything, and kep' scribbling on his blotting-paper, and he says'—

'Well?'

'He says, "How would you like to be my wife?" says he. And I thought as I hadn't heard right, seeing as my breath was took away by its being so sudden like, and I says, "What?" for all the world just as you did this minute. And he says again, "How would you like to be my wife?" and I as near as anything laughed out, it seemed so funny like to hear him as were always so grave and serious, and not a bit like courting, let alone marrying. But I didn't. I only says, "You wouldn't go for to marry a girl like me;" and he says, "Why not?" And I

says, because he were a lot older, and master, and me only just one of the hands. He were a bit vexed about the age, and said he weren't as old as he looked; and as for being master, so he were, but his father weren't nothing better than a mill hand, and his mother a factory girl.

'And then I says, "And there's your mother;" and he says, "She can't hinder even if she's a mind to, and we wouldn't live along of her; but I'll take a pretty place outside of the town, and fit it up all new, and you should have a carriage to ride in, and plenty of nice silk gownds, and pretty things, and a servant, so as you shan't have to put your hand to nothing." Only to think, Alice, of me setting up in my own drawing-room in a silk gownd with a gold ring on my finger!'

The girl stopped breathless; and Alice, too, drew a long breath, as if all this grandeur were too much even to imagine.

'There's no mistake?' she said at last; 'he don't mean nothing but what's right and fair?'

'No, that's all right enough, but'—

'Well?'

'It's all very grand and fine, but I don't know but what I'd as lief rub along with you.' And then she burst into a sudden passion of tears, and clung to Alice and sobbed; and then as suddenly recovered her spirits, and darted off to get a bloater for supper, and cooked it herself, though Alice was generally the one to prepare their meals; and she laughed and talked nonsense, and made fun about this solemn lover of hers, and about what she should do when she had a grand house of her own, and Alice came to visit her.

She, too, was the first to fall asleep that night, with a smile on her lips, which lingered there when Alice, more than once in the night, struck a match, to see how the time was passing, which goes so slowly and heavily to watchers, and slower still when full of anxious thought, as was the case with her. Any one might have thought that it was Alice who was going to take this important step, and that Lucy was an unconcerned spectator; for after she had once told Alice, she seemed to have no further serious thought or anxiety on the subject, but treated it all as a joke, and would not let Alice pull a long face or talk solemn, as she called it.

CHAPTER II.—A FRIEND.

You were so far away,
Beyond all help from me;
And so, when skies were gray,
And clouds lowered threateningly,
And the wailing storm wind blew,
My heart went out to you.—K. TYNAN.

That was eighteen months ago, and now, on this cold March day, the report crept about in the mill that Mrs Craddock, 'she as used to be Lucy Coles,' was dying. I do not know how the news came to Alice Reynolds. I do not think, careless as many of the mill-girls were about giving pain, and little as they liked Alice, whom they described as a stuck-up piece of goods and a born old maid, they would have ventured to strike her to the heart with such a piece of news.

'Not as she'd have any cause to feel of it much,' they whispered to one another; 'seeing as Mrs Craddock turned her back on all her

old friends, and ain't been to see Alice once since the wedding. No, nor Alice ain't crossed the door-step of that smart villa where she's quite the fine lady, folks says.'

Anyhow, Alice knew, she sometimes fancied she felt without being told, when anything went wrong with Lucy. It was only fancy, of course, and a very good thing for her that it was not reality, for she would have had many an ache at her heart during those eighteen months on Lucy's account; for the marriage had not turned out happily, and Lucy herself, in a mind dulled with weakness and pain, felt almost glad that it was so near an end, in spite of the natural clinging to life in the young, and for the matter of that, in the old also.

It was quite true, as the mill-girls had said, that Lucy's marriage had separated her and Alice. Alice had made up her mind to this—at least she thought she had—from the very first, even that first night when she lay awake with Lucy sleeping so peacefully beside her. And she told herself that it was only natural, and she quite expected it, and she did not really wish it otherwise, when day after day went by, and Lucy neither came nor sent to her.

But in spite of having expected it, and being so perfectly resigned to it, she felt it very sorely, though she would have quarrelled with her best friend who said so; and she grew to have a nervous dread of meeting Lucy or even of hearing her name, and she hurried away from the groups of girls, who, you may be sure, had plenty to say of the young madam. She kept more and more by herself, and took to going home to Grape Gardens by a circuitous route, along dirty back lanes and alleys, to avoid the chance, which once befell her, of being passed by a briskly trotting pony driven by a man in livery with some one sitting beside him, though who it was Alice only guessed; for she turned and stared hard into a corn-chandler's shop, as if her whole interest were engrossed in the white chalk horse and a sample of oats on which her unseeing eyes were fixed.

She left off going to the church where she and Lucy used to go together, and went far out into the country to churches in the villages round, to avoid the risk of seeing Lucy and her husband; and on pay nights she would rush into the office when her turn came and hurry out again, hardly looking at the master, for fear he should think she was waiting for a word from Lucy, or was expecting to be treated with peculiar consideration because she had been his wife's friend.

Once he called after her when she was leaving the office, but she pretended not to hear, and then suffered agonies of remorse for fear Lucy wanted her. And it was the night after this that she paid her first visit to Apsley Villa, the house which Mr Craddock had taken on his marriage, and which Alice till then had scrupulously avoided.

Even now she got no farther than the gate, where she stood for nearly half an hour, looking at the white stucco front, which appeared to her very imposing, with its bow-windows and glass porch filled with flowers; and she watched till a light appeared in one of the up-stairs windows, and some one came and drew aside the blind and looked out, and then she slipped away, afraid of being noticed, and sure that the face looking out

was Lucy's, though in fact it was the house-maid's.

She had caught a bad cold that first winter she was alone (she was always a frail, little thing), and was obliged to stop at home a few days; but she went back to work long before she was really fit, for fear Lucy should hear and be unhappy, or come and see her in spite of her husband's wishes. And she would smother her cough when Mr Craddock was within hearing, and draw up her head, and walk briskly as she passed the office door, as if her limbs were not aching with weariness.

But to-day there was no need for any pretence, for the office was empty. Mr Craddock had not been there all day, and perhaps it was this absence of his that made her more attentive to the stray words that reached her ears from time to time, and convinced her that something was seriously wrong at Apsley Villa.

She was among the last to leave the mill, and when she got out into the lane, all the hands had dispersed; for, as I have said before, the wind was so cold and searching, that not even the most inveterate gossip would care to defy it. But Alice wrapped her shawl tightly round her, and without a moment's hesitation set off right in the face of the wind, along High Street, without taking the turn down into the back streets, which had been her way home of late, and which afforded now some protection from the wind, and she went straight on towards Apsley Villa.

It was getting dusk, and the lamps were being lighted along the streets and along the Mellingham Road, for Apsley Villa did not stand far enough out of Felsby to be beyond the reach of gas and other town advantages. And this time she did not stop at the gate, but went in, and along the short drive to the front door. A carriage was waiting there; but, undeterred by this, and undistracted by the sweetness of the hyacinths, primulas, and narcissus with which the porch was filled, and which she could hardly have passed at another time, she rang the bell.

Apsley Villa was nothing surprisingly grand; but certainly Alice Reynolds, in her mill dress stained with oil and much wear, and with a faded plaid shawl over her head, did not look altogether appropriate standing in the porch among the flowers, with the lamp shining brightly down upon her, and revealing pitilessly the shabbiness of her appearance; so perhaps the smart parlour-maid was to be excused for her feeling of indignation, more especially as the coachman on the brougham outside was looking on with some surprise and amusement.

'Well to be sure! some folks has impudence!' said the parlour-maid, tossing her head with its white cap and long streamers. 'We ain't nothing for you. Master don't give nothing to tramps.'

'I ain't no tramp. I wants to know how Mrs Craddock is.'

'Then, if you're from the works and wants to see master, you did ought to know better than to come to the front door.'

'I didn't know as I didn't ought to come to this door. And I don't want to see the master; it's the missus as I wants to see.'

'Then you just can't. She's that ill that nobody don't see her.'

'Will you tell her as I'm here?' Alice made

a step forward into the hall, with a determination which made the servant make way for her involuntarily, though the next minute she resented this fresh piece of 'imperence.'

'Now, my good woman, you'll have to be off, or I'll call the master to you. You can't see Mrs Craddock' (as may be fancied the terms between poor Lucy and her servants had been a little strained, and a smart parlour-maid could hardly bring her mouth to call a mill-girl 'missis'); 'she's too ill, and I can't take no message.' The servant's voice assumed a more civil tone as she went on, for a door behind had opened, and a gentleman came into the hall.

It was the doctor, and he looked at Alice as he passed, and then stopped. 'What does she want?'

'She's a girl from the mill, sir, and she's wanting to see the missus; wanting to beg most likely, but I've been telling her she's too ill, poor dear, to be troubled.'

'Did you know she was ill?' asked the doctor.

'Yes, that was just why I come. She and me used to be friends in old times, pretty well like sisters, and I've nursed her many a time, and I knows just all her fancies when she's ill, and Lucy had a-many fancies, and I've always a-humoured her as far as I knew how.'

'Take her up,' said the doctor, and when the servant hesitated, he added, 'I'll make it all right with your master,' and stepped back into the room he had just left, while the servant with great unwillingness led the way up-stairs.

At another time Alice would have been keenly alive to the softly carpeted stairs, to the coloured panes in the window she passed, and to a large glass bowl with goldfish in it on the landing, but she did not even notice them; nor, when the bedroom door was opened at the servant's knock, and a hospital nurse, after a whisper about 'Doctor says,' admitted her to what must certainly have been the most luxurious bedroom Alice had ever seen, did she see anything but Lucy, her Lucy, lying there motionless in the bed, with a white wan face and closed eyes, all alone.

It was that loneliness that had been in the doctor's mind, quite haunting him as he left the house, and it was this that made him stop and look at Alice with a strange sort of intuitive feeling that with her the poor, young, dying girl might not be so alone. And yet it would have been hard to say why this loneliness should have impressed him, seeing that she had an excellent and kind nurse always in attendance, and a husband who had not left the house all day, and was in great anxiety about her condition, and a mother-in-law who was ready to take the nurse's place or share her watching, and yet the doctor went away quite sore at heart at the thought of her loneliness, and Alice's first feeling was 'all alone.'

It was quite contrary to all the theories of the hospital nurse to disturb a patient who, for the first time for many a restless, painful hour, was lying quiet if not asleep; to have the bedclothes, which had just been arranged with hospital precision, tumbled and disarranged by two arms, in sleeves faded and stained by factory work and wearing into a hole at the elbow, which clasped

the patient close, and drew her head to rest on a shoulder on which was a patch of a somewhat different shade from the rest of her dress.

But we all have to pocket our theories sometimes, and confess that we cannot shape all circumstances to meet them, and so the nurse's remonstrances died on her lips, when she saw the patient's eyes open with a life and brightness they had not had for days, and heard her voice, stronger than she had had any experience of hitherto, say, 'Alice, old girl, why, it's never you?'

With a wisdom which ought to have been favourably noticed on her certificate, she made no protest against this very irregular proceeding, but turned to the fire and busied herself with something rolled up in flannel in a bassinette, and left the two friends undisturbed, and when it was time for medicine or food, she brought it to the bedside and did not resent its being taken from her by Alice, and seeing her own patient coaxed into taking what she knew no entreaties of her would have prevailed upon her to touch. She was a real good nurse and no mistake, and I should like to have her to nurse me if I were ill.

They did not say much; it does not need words between loving hearts. A gentle pressure of the arms that clasped Lucy, a tender, rocking motion of the shoulder on which the weary young head rested, a feeble clasp from a weak, wasted hand that had lost all sign of the factory work, and on which the massive wedding ring seemed too heavy; that was quite enough.

And when, an hour or two later, a step sounded outside, and a knock came at the door, the nurse whispered to Mr Craddock, in answer to his inquiries for his wife, that she was sleeping quietly, and drawing back let him look in at her and see her with her head on Alice's arm, and her fingers twisted in the shabby fringe of her friend's shawl, as if to prevent her slipping away while she slept. 'She is better,' said the nurse.

IN A REFORMATORY SCHOOL.

'WHAT place is this?' I heard a man ask another the other day, as the two were passing one of our rural reformatories. 'It's a Reformatory School' was the answer. Evidently the inquirer was ignorant of the meaning of reformatory, for the second man explained in answer to another question: 'It's a place as they put kids in what nip anything.'

To the majority, no doubt the words 'reformatory school' bring hazy notions of youthful criminals, hard work, poor living, and prison discipline—in short, a life of misery dragged out for four or five years. I will endeavour to show what five years in a reformatory really mean; and, without entering into any of the questions which philanthropists and men of sentiment continually raise with regard to the efficacy of the work, I will give a faithful outline of a boy's life and training while under detention, so that the public may judge for themselves what the outcome of such training is likely to be.

No boy is admitted to a reformatory after he

is sixteen years of age, nor until a qualified medical man has certified that he is fit for physical training. These institutions are not hospitals, and have no scope for dealing with any but those who can bear the same discipline as the majority. Neither can a lad be sent to one of these schools until he has undergone punishment for the crime of which he was convicted, and, once within the walls, he is never reminded of his past misdeeds. Steady hearty work, honesty, and prompt obedience are the fundamental rules in all schools, and to the credit of the teachers and taught, it is but rarely indeed that they are defied. When we bear in mind that the boys dealt with—with few exceptions—were utterly incorrigible and unamenable to all authority—in fact, brought up to beg and steal, having no knowledge of any existence but that in which drink, dirt, and squalor were inextricably mixed—the change that is wrought in a boy by five years' steady discipline is wonderful.

To bring the reality of what I write as closely home to my readers as possible, I will describe the work as I see it carried on every day. The school is a small one, certified for fifty boys, and is situated in the midst of an agricultural district. Attached to it is a farm of fifty acres, which serves to supply the boys with work during the greater part of their time—neither plough nor reaping-machine forming any part of the property of the institution. When not required on their own land, the boys are hired out by the neighbouring farmers; and their labour is eagerly sought after. All the domestic work of the school is also done by them—cooking, scrubbing, washing, sewing, mending, and darning. It is a pleasant sight to see them start off to work in the morning. Every boy knows just what he has to do, and he goes to it knowing that if it is well done he will have a word of praise and recognition; but if the contrary, that the reprimand will come as surely. 'If a thing is worth doing at all, it is worth doing well,' is a truism that every lad is made acquainted with; and it is the earnest endeavour of those in charge to train the youths to see the truth of it.

Every one is encouraged to put forth all his energy whether at work, in school, or at play. Discipline is maintained without too much form, and true English home-life is, as far as is compatible with circumstances, infused into the system. Half-past five is an early hour to turn out of bed, yet at that time the bell calls all up. It takes but a short time for them to dress, open their windows, make their beds, march down to the lavatory for a good wash, and then begin the real work of the day with two hours' lessons in school. School is a great trial to most newcomers, for many boys when first admitted do not know the letters of the alphabet, and mastering the elements of the English language is tedious work for them. They would much prefer two hours' hard digging; but what must be cannot be avoided, and the progress they make is surprising. When lessons are over there is half-an-hour's play, then breakfast, a short Scripture lesson and morning prayers.

Now for parade in the yard. Each lad falls in, and stands to attention, while numbers are called out, and boys told off for their different duties during the forenoon. Mayhap twenty are going to work for some farmer who knows that boys like a bun or a glass of milk between meals, and who is not above exchanging a cheery 'Good-morning' with them when he meets them; while the others are distributed to suit the requirements of the house and farm according to their merit and ability.

A lad's great ambition is to be promoted to a monitorship, and those boys who are striving hardest to gain this are given definite duties, which they keep so long as their conduct entitles them to do so, or until they are raised a scale higher.

At half-past twelve the bugle sounds, as a signal to leave off work; and hungry lads come in to find a substantial meal awaiting them in their dining-room. When every one has finished, grace is sung, and all troop off to play, sometimes at football, sometimes at cricket, according to the season. Oftentimes all may be seen busy on their little garden plots, which in the summer are gay with many-hued flowers. Ask a boy the name of any plant among them, and it will be strange if he does not know it and something of its history as well. At two o'clock, work begins again, and usually lasts until half-past five, when again the bugle sounds to finally call all in for the day. Each lad as he comes in goes straight to the lavatory and makes himself spruce and tidy for the evening; and then, after half-an-hour's good fun, he is thoroughly ready for his supper. But the day's work is not finished yet, for there is another hour and a half in school, and no one is sorry when the bell rings for evening prayers and it is time to be off to bed.

A week's good work earns a half-holiday on Saturday, and sometimes a night in the course of the week, when slates and lesson-books are left in the cupboard, and draughts, puzzles, and games take their place; or perhaps it will be a night's band practice, for the school can boast of a 'drum-and-fife' band, and not one of the boys but likes to think he is a musician.

Officers and lads are on the best of terms, and there is a strong feeling of sympathy between them. The majority of the boys would as soon think of flying as of taking an undue liberty with any of their instructors. When a case of insolence does occur, it is generally from some youth who has not been long enough in the school to know what the consequences of such conduct are likely to be.

Ingrained habits, however, are not eradicated in a few weeks, and bad boys don't develop into full-fledged angels all at once. The best of masters may well feel discouraged at times. A boy who has been going on well for some time has been found pilfering; another has been detected at wanton mischief; or it may be that a boy who has had every confidence reposed in him suddenly absconds at the instigation of one of the black-sheep of the school. A well-regulated system of rewards and punishments has done much to put down petty crime within the walls, and every moral influence is brought to bear upon the boys that can help to keep them in the paths of rectitude and truth.

Every inmate may, if he likes, earn a shilling a month by gaining the maximum number of marks—one hundred and forty-four. If a lad loses twelve marks, he loses one penny, and his chance of being a monitor or duty-boy for the month. If guilty of a serious offence, a youth makes the acquaintance of the best of all remembrancers, which, after all, in spite of what sentimentalists say, is the most wholesome of all correctives for hardened offenders. Every case of corporal punishment is taken note of, and is posted up in the schoolroom, that all may read. If a boy knows his friends are coming to see him when his name is there, he looks very glum indeed.

Sunday is a day of rest. All attend the village church morning and night. In the afternoon, the boys enjoy a quiet chat among themselves, read their library books, or have a story read for them.

Every season brings its own work and enjoyments. In the winter they prepare the land for the spring, thresh the autumn crops, and finish off the numberless oddments that are left for that time of the year. Then there is many a jolly hour's sliding when Jack Frost is kind; and, occasionally, that delight of every school-boy's heart, a regular snowball battle. This is the season, too, when concerts are got up, and how hard all practise that there may be no hitch on those auspicious evenings! No need to describe the work of the spring. Every one knows what that means to the farmer. But what matters it for hard work when you see your labour reducing all to order, in readiness for the seed which must soon be sown. Then, when seed-time is over, how eagerly all look for the first appearance of the young leaves above the ground. In their gardens, every little morsel of green is watched with an interest that those whose lives have more changes might well envy. Nor are the duty-boys idle indoors. This is the time of scrubbing, painting, and whitewashing, for spring sunbeams have an ugly knack of showing up begrimed corners, and all must be made clean and bright after the winter's smoke and fog.

Then comes summer with its long days of heat and sunshine, when cricket takes the place of football in the playground, and hoeing and weeding keep every one busy all day long.

The season they like best is autumn; and for days before they commence reaping there is much talking of former prowess with the sickle. When they do begin, their whole energy is given to their work, and two extra meals a day are only a just compensation for the extra tear and wear of muscular tissue. Every lad does his level best, and all work as one, for are they not reaping their own corn, gathering in their own sheaves? They sowed the seed, they watched it grow to maturity, and now they are striving to garner it in its due time; and were you in the neighbourhood when the last load is carried, you would hear such a clamour of vociferous cheering as might well make you say, 'Something pleases the reformatory boys very much to-day.'

Nor are the lads without their special gala days: Easter Monday, sundry birthdays, Harvest Home, Christmas Day, and even Examination Day, are all times to be remembered long after they have left school.

Thus pass the weeks, months, and years. Every day separates the boys more and more from their past life. Their moral characters develop under the firm guidance of cool heads and warm hearts; and although there are cases which are almost hopeless, there is no boy but learns all that is needful to enable him to earn an honest living and lead a decent life. As far as is possible the school authorities endeavour to keep in touch with every lad, and use the moral influence they have acquired over him long after his school-life has come to an end.

VEGETABLE PEPSINE.

VEGETABLE Pepsine is the name very aptly given to the juice of the unripe fruit of the Papaw (*Carica Papaya*), a plant fairly well distributed throughout the tropics. The papaw is a handsome tree, and would well serve as an ornament to gardens; but it would leave very little room for the growth of shrubs and bushes, as it absorbs an incredible quantity of moisture. When not topped, its cylindrical stem attains a height of ten to twenty feet, crowned by a number of large leaves. It is a very quick grower indeed, and the flower unfailingly becomes a fruit, so that almost daily every period of growth from the bud to full ripeness may be observed on the tree.

The useful properties of the papaw plant have long been known to the various natives, and have been taken advantage of by them, as can be seen by reference to the works of travellers who can themselves vouch for the accuracy of the accounts they narrate. Thus Drury, in *The Useful Plants of India*, states that old hogs and poultry which are fed upon the leaves and fruit, however tough the meat they afford might otherwise be, are thus rendered perfectly tender and good, if eaten as soon as killed. Browne, too, in his *Natural History of Jamaica*, says that meat becomes tender after being washed with water to which the juice of the papaw tree has been added; and if left in such water ten minutes, it will fall from the spit while roasting, or separate into shreds while boiling. In his *History of Barbadoes*, Griffith Hughes mentions that the juice of the papaw tree is of so penetrating a nature that if the unripe peeled fruit be boiled with the toughest old salted meat it quickly makes it soft and tender. Karsten also tells us that boiling meat with the juice of the papaw is quite a common thing in Quito. Captain S. P. Oliver, writing in *Nature*, July 10, 1879, says: 'In Mauritius, where we lived principally on ration beef cut from the tough flesh of the Malagasy oxen, we were in the habit of hanging the ration under the leaves themselves; and if we were in a hurry for a very tender piece of fillet, our cook would wrap up the undercut of the sirloin in the leaves, when the newly-killed meat would be as tender as if it had been hung for a considerable time.'

It is not surprising that the attention of medical men abroad was drawn to the wonderful solvent action exercised by the leaves and fruit of the papaw tree. They soon commenced using the juice from the fruit in simple cases of

indigestion; and when they found good results follow, they extended their experiments to more complex disorders. Surgeon B. Evers, writing upon Indian Medicinal Plants in the *Indian Medical Gazette* in 1875, mentions some cases in which he used it satisfactorily in enlarged spleen and enlarged liver. Out of sixty cases which he treated, thirty-nine were cured; in eighteen the results were not reported; and in three cases of enormously enlarged spleens, relief was afforded. The juice was administered as follows: a teaspoonful was mixed with an equal quantity of sugar, and the mass divided into three boluses, of which one was taken morning, noon, and evening. For children, a single drop of the juice was given as a dose mixed with sugar.

The juice of the papaw has been used with very great success in many other complaints. In Mauritius it is regarded as one of the most successful remedies for intestinal worms, a single dose being usually sufficient for a cure.

Attention was first drawn to the remedy in this country about 1879. Dr T. Peckolt, who made a thorough study of the plant when he was abroad in Brazil, succeeded in extracting the active principle from the juice of the fruit, to which he gave the name of Papayotin. In the following year Drs Bouchut and Wurtz investigated the plant, and separated the active principle, to which they gave the name of Papaine. This proved to be identical with Dr Peckolt's Papayotin, so that the two terms may be regarded as synonymous. Dr Bouchut also made a very important discovery which opened an entirely new field for the use of papaw. He found that both the diluted juice and Papaine had the property of digesting living tissues, normal or pathological, such as adenomata and cancer, and converting them into peptones in exactly the same way as dead ones. This knowledge was very soon turned to account. Surgeons commenced to treat abnormal growths with Papaine, and found it most efficacious in removing the false membranes of croup and diphtheria. As a rule, solutions of one in ten were employed for painting the throat, and in some instances Papaine was also given internally.

About the same time, a well-known London surgeon, a specialist in skin diseases, tried its effect upon an obstinate case of eczema with marked success. His prescription was composed of twelve grains of Papaine and five grains of powdered borax in two drachms of distilled water; this was painted on the parts twice daily; and in less than a month the hard horny masses of heaped-up epidermis had entirely disappeared from the skin, and the texture was left quite normal.

We ought not to conclude this notice of papaw without mentioning that the natives and residents abroad find the ripe fruit a delicious dessert. Dr Peckolt, whom we have already referred to, has given us some interesting data from an alimentary point of view in a paper he published upon the Papaw Plant some few years back. He says: 'This herbaceous tree is in Brazil a constant companion of the banana, and is never wanting near the huts of the natives. And rightly do the Indians honour this useful and most grateful tree, specially selected by Providence for people averse to any cultivation, for

without the slightest care or labour after a few months' growth it yields harvests the whole year through. Notwithstanding that in respect to nutritive value the fruit cannot compete with the banana, its use makes a refreshing change.' There are three varieties known, and of these the 'Mamao melao' is regarded as the best.

In Brazil, Dr Peckolt says, 'the tree is scarcely cultivated, or with but little care, its continual planting, like that of the banana, being self-effected, but with this difference, that instead of shoots from the roots, it is done by the seeds of the fruit falling on the ground. The tree is simply left to stand where the seed has been planted, either by the use of the fruit as manure, or by the agency of birds; the tender young plants brave all weathers, and are very tenacious of life, are not eaten by animals, and after becoming ten inches high, are not prevented by injury to leaf or bark from growing luxuriantly and almost perceptibly to the eye, even more rapidly than the banana. The fruit, like the banana, is collected in the full-grown but still green condition, so as to ripen in the house. If perfectly ripe when taken from the tree, the flesh, especially in the neighbourhood of the skin, is bitter; moreover, the ripe fruit is difficult to secure against destruction by birds.'

THE FLOWER-GIRL.

THE cold wind nipping at her feet,
She loiters in the busy street
Forlorn and lonely,
And proffers there with wistful eye
Pale blossoms to the passers-by—
A flower-girl only.

Yet never has her young life known
The dells and valleys where have blown
The flowers she fingers.
She knows not of the charms that cling
About the woodland ways, when Spring
On Summer lingers.

Her little foot has never pressed
The dewdrop on the gowan's breast
At eve or morning;
Nor did she ever yet behold
The genial Autumn's fruitful gold,
The plains adorning.

The lilies that she holds for sale
Are not, in sooth, so sickly pale
As her young face is—
A face that speaketh eloquent
Of life in thrall of poorth spent
Down sunless places.

She sees not in the flowers she sells
Young April twinkling on the fells
Or in the wild wood;
But we, to whom they speak of Spring,
May here some bit of sunshine bring
To cheer her childhood.

PRICE 1½d.

THACKERAY'S LONDON.

THE influence of the great centre of national life upon our literature may be traced in the writings of many of our foremost novelists and essayists, some of whom, like Dr Johnson or Charles Lamb, have left on record their love for London's busy streets or quiet nooks and corners; while others, such as Dickens, have invested the local habitations of their characters with almost as great an interest as attaches to the characters themselves. Thus we seem as familiar with the old prison of the Marshalsea as with Little Dorrit, with Golden Square as with Ralph Nickleby. In Thackeray's works it is the west end of the town which is more especially illustrated, and it is more often the personality of the inhabitant than the house itself which leaves an enduring impression on the reader's mind—facts which may serve to explain why so little has been written on the London of Thackeray when compared with that of Dickens. Yet Thackeray's knowledge of London, the foibles of its fashionable life, and the humours of its clubs, was extensive; and the various localities in which he from time to time took up his abode are mostly to be found depicted in his novels and sketches—such as the Charterhouse, where he passed his school-days; or Kensington, in which the later years of his life were spent. Few schools have been more immortalised in literature by an old pupil than has the Charterhouse by the great novelist—that Hospital of Gray Friars with its memories of Addison and Steele, where the 'Codd' Colonel stood among the poor brethren uttering the responses to the Psalm for Founder's Day, and where he murmured his final 'Adsum.' Here Thackeray sent Philip Firmin, Clive Newcome, and little Rawdon Crawley; and it was in the chapel of his old school that he himself made his last appearance in public to commemorate with other old Cistercians the praises of Thomas Sutton, the Founder.

The neighbourhood of Covent Garden was familiar to Thackeray, and he has described it

with picturesque accuracy: 'the two great national theatres on one side; a churchyard full of mouldy but undying celebrities on the other; a fringe of houses studded in every part with anecdote and history; an arcade often more gloomy and deserted than a cathedral aisle,' and its 'rich cluster of brown old taverns.' At the Bedford Hotel he was a frequent visitor in his youthful days, though it was then only in name the old coffee-house which had been once 'the emporium of wit, the seat of criticism, and the standard of taste;' when every night, with its crowd of 'polite scholars' and wits, jokes and bon-mots were echoed from box to box. It was more particularly patronised by theatrical celebrities, among whom Sheridan and Garrick were the most famous.

Close by, in the north-west corner of Covent Garden, was Evans's Hotel and Music-hall, which appears in the *Newcomes* under the transparent disguise of the 'Cave of Harmony,' whither the Colonel took Clive, and found so much to object to in the singing of Captain Costigan. From the date of its building in the reign of Charles II., this house was destined to undergo many changes of fortune. At one time it was the home of Sir Kenelm Digby, then of that Admiral Russell who, in 1692, defeated the French fleet off La Hogue; and was opened in 1774 as a family hotel—one of the first of the kind in London. After one or two other changes in the proprietorship, the Hotel passed into the hands of Evans of Covent Garden Theatre; and the musical entertainments soon became famous, and continued to be a feature of the house after 1844, when it had become vested in John, more popularly known as 'Paddy' Green. Thackeray was one of the many men of letters who frequented the house; and it has been told us how one day, when the *Newcomes* was in course of publication, Lowell, who was then in London, met him in the street, serious in manner, and with looks telling of weariness and application; and how, in response to the kindly look of inquiry in the poet's eyes, he said: 'Come into Evans's, and

I'll tell you all about it. I have killed the Colonel.'

Another house of lyrical talent was the tavern in Maiden Lane known as the 'Cider Cellars,' for many years the chosen resort of the bohemian world, and the favourite haunt of Professor Porson. This was no doubt the prototype of the Fielding's Head, at which was held the little club called the 'Back Kitchen,' where it will be remembered Pen and Warrington listened to such airs as the *Brown Jug* or *The Good Old English Gentleman*, interspersed with those of a different type.

'Le monde où l'on s'amuse' is described in many a page of Thackeray's works, and in one of the *Roundabout Papers* he gives us a list of his favourites of song and of the drama in his youthful days, when Sadler's Wells and the Adelphi were at the height of their fame, when Taglioni danced, and such singers as Sontag and Malibran were to be heard at the Opera. Vauxhall is frequently mentioned in his novels with the hundred thousand 'extra' lamps which were always lighted; the fiddlers in cocked hats, who played ravishing melodies under the gilded cockle shell in the midst of the gardens; the comic and sentimental ballad-singers; the country-dances; and the hermit who always sat in the illuminated hermitage. Here it was that the Sedley party was so disturbed by the conduct of Jos, under the influence of the rack punch. Vauxhall was also the scene of the visit of Arthur Pendennis when he met Captain Costigan and his guests from Shepherd's Inn. It was Uncle Newcome who took the children to Astley's, and laughed at the clown's well-worn jokes at the representation of the 'Battle of Waterloo.'

The Temple, with its old-world courts and cloisters and its numerous associations, had a peculiar fascination for Thackeray as for Dickens and other writers. About the year 1846 he seems to have occupied chambers at 10 Crown Office Road, Temple, his friend Tom Taylor having a set of rooms in the same house. Here, in Lamb Court, Pen abode with his noble-hearted friend Warrington, and was visited by his uncle, Major Pendennis, who had great difficulty in climbing up the abominable black stairs to the third storey, to be mistaken at last for the beer which Warrington had been anxiously expecting. Here, too, in the *Newcomes*, we find the same occupants visited by the Colonel and Clive. It will be remembered, likewise, that the Hon. Mr Deuceace, the youngest son of the Earl of Crabs, is described by James Yellowplush as 'a barrystir—that is, he lived in Pump Court, Temple: a vulgar nay-brood witch praps my readers don't no. Suffiz to say it's on the confines of the city, and the choasen abode of the lawyers of this metrapolish.'

Shepherd's Inn in *Pendennis* might be any of the quaint old Inns of Chancery which are so fast disappearing from modern London. Thackeray has described with more minuteness than usual the quadrangle, approached by curious passages and ambiguous smoky alleys on which the sun has forgotten to shine. 'Slop-sellers, brandy-ball and hardbake vendors, purveyors of theatrical prints for youth, dealers in dingy furniture, and bedding suggestive of anything but sleep, line the narrow walls and dark case-

ments with their wares. The doors are many-belled; and crowds of dirty children form endless groups about the steps, or around the shell-fish dealers' trays in these courts, whereof the damp pavements resound with pattens, and are drabbled with a never-failing mud.' Clement's Inn as it was half a century ago, in the days when the law-courts were yet at Westminster, appears to be indicated by the description. Captain Costigan had his abode at this Inn, and pretty Fanny Bolton dwelt at the porter's lodge.

The more remote or less fashionable districts of London do not figure largely in Thackeray's later works, nor must we look there for descriptions of the poor and their dwellings, the seamy side of life being generally depicted in his novels in connection with impecunious gamblers of high degree. *Catherine*, his only story of 'low life,' was written as a protest against the then prevalent fashion of painting its often sordid and mean details in attractive and at the same time unreal colours. Ikey Solomon of Horsemonger Lane is supposed to tell her sad history. In the jail here it was that Moore and Lord Byron paid a visit to Leigh Hunt, who was suffering for having indiscreetly styled the Prince Regent an 'Adonis of fifty.' The out-at-elbows Colonel Crawley was for some time confined in Sloman's sponging-house in Cursitor Street, Chancery Lane. This place, splendid with its huge old gilt cornices and dingy yellow satin hangings, in contrast to its chained and fast-barred door, has also been described by Disraeli in *Henrietta Temple*. The Fleet, with its memories of *Pickwick*, was where Barry Lyndon passed the end of his days in the company of his old mother. Here, too, Captain Shandon was very much at home, and lived as a king, adored by his wife; to which circle Arthur Pendennis was introduced in the course of his literary career.

Thackeray's early married days were spent in Great Coram Street, near the Foundling Hospital, and many of the streets and squares in that neighbourhood, as well as about Smithfield, are to be found in his works. The happy possessor of the great Hoggarty Diamond dines with the Roundhands in Myddelton Square, Pentonville—the name of which commemorates the inventor of the artificial New River. In the same story the Samuel Titmarshes are made to reside in a genteel house in Bernard Street, Russell Square. In one of the *Yellowplush Papers*, Mr and Mrs Altamont live in Cannon Row, Islington, in as comfortable a house as well could be, 'carpeted from top to to; pore's rates small, furnitur elygant, and three deomestix.' In Russell Square was the well-known home of the Sedley family, and Thackeray is said to have once pointed out to a friend the identical house in which he had located them. The vast and melancholy house in Fitzroy Square, 'cheerfully ornamented in the style of the end of the last century with a funeral urn in the centre of the entry, and garlands and the skulls of rams at each corner,' was tenanted by Colonel Newcome; while in Howland Street, close by, Clive went to live with his wife and mother-in-law when misfortune fell on him.

It is, however, in Mayfair, St James's, and other districts of the West End that we meet with the majority of the novelist's characters. Dr Firmin and Philip lived in Old Parr, that is,

Old Burlington Street, whence the fashionable world had fled, finding it too dismal. In Gaunt Square, Lord Steyne had his town palace. Some have recognised Berkeley Square in the description of this spot with its mansions passed away into dowagerism—tall dark houses, with window-frames of a lighter red, and blank iron 'extinguishers' that still flank the lamps over the steps. It was in Great Gaunt Street, leading out of the Square, that Becky Sharp first made the acquaintance of the eccentric Sir Pitt Crawley; and in Curzon Street, Mayfair, that she lived as the wife of the impecunious Rawdon in the snug and complete bachelor's residence with its geraniums in the window and carved bronze knocker. Not far away—in Queen Street—that veteran of fashion, old Lady Kew, abode, and might even sometimes have been found, when London was supposed to be a desert, cowering over a bed-candle and a furtive teapot in the back drawing-room. Conveniently situated for her ladyship's devotions was Lady Whittlesea's Chapel, where the Rev. Charles Honeyman officiated. Park Lane is represented by Lady Ann Newcome and Miss Crawley with her pug-dog; while Mrs Hobson Newcome lived in Bryanston Square. More interest perhaps attaches to the Bury Street lodgings of Major Pendennis, the daily scene of his elaborate toilet.

Pall Mall, the 'sweet shady side' of which was the favourite haunt of the beaux and dandies of the Regency, was familiar to Thackeray, who began and finished *The Luck of Barry Lyndon* while staying in St James's Street. No more congenial district could have been found for the worldly-minded old Major, who loved to station himself in the great window of Bays's Club—the bow-window of White's—with half a score of old bucks similarly recreating themselves—old fogies who, Pen unkindly suggested, should be set up in wax at Madame Tussaud's in a Chamber of Horrors by themselves. The humorous side of club-life is admirably portrayed in the *Book of Snobs*. A member of the Athenæum and the Reform, Thackeray was particularly partial to the smoking-room of the Garrick Club, then situated in King Street, Covent Garden. It was here, at the annual dinner held on Shakespeare's birthday, that he said, 'We the happy initiated never speak of it as the Garrick: to us it is the G., the little G., the dearest place in the world.' It was at Willis's Rooms, the old Almack's, in King Street, Pall Mall, that he delivered, in 1851, his lectures on the English Humorists. In the vicinity of Brompton and Kensington his life as a successful author was mostly passed. Becky Sharp on her marriage retired to snug little Brompton lodgings; and in a cottage in a street leading from the Fulham Road, with the romantic title of St Adelaide Villas, Anna Maria Road West, old Mr Sedley hid his head with his wife and daughter when the crash came. There is a touch of Dickens in Thackeray's description of this neighbourhood, 'where the houses look like baby-houses; where the people looking out of the first-floor windows must infallibly, as you think, sit with their feet in the parlours; where the shrubs in the little gardens in front bloom with a perennial display of children's pinafores, little red socks and caps; and where little porter pots hang on the railings sunning themselves.

In 1847 Thackeray went to live in Young Street, and once pointing out the bow-windowed cottage to an inquiring friend, is said to have remarked: 'Go down on your knees, you rogue, for here *Vanity Fair* was penned; and I will go down with you, for I have a high opinion of that little production myself.' Here he also wrote *Esmond*; and one of the houses close by, in Kensington Square, has been chosen as the home of Lady Castlewood and Beatrice. In 1862 Thackeray removed from Onslow Square, where the *Newcomes* and the *Virginians* had been composed, to the house he had built himself in Palace Green, still remaining in the old court suburb with its leafy trees and gardens, to which he was so much attached. Here it was that the completion of *Denis Duval* was cut short by his lamented death in the following year.

BLOOD ROYAL.*

CHAPTER VIII.—AT 'OXFORD COLLEGE.'

'WELL, I don't know what you fellows think, but as far as I'm concerned,' Trevor Gillingham remarked, with an expansive wave of his delicate white hand, 'my verdict on the Last of the Plantagenets is simply this: the Prince of the Blood has been weighed in the balance and found wanting.'

It was a fortnight later, in Faussett's rooms in the Chapel Quad at Durham (Chapel Quad is the most fashionably expensive quarter), and a party of raw lads, who took themselves for men, all gathered round their dessert, were engaged in discussing their fellow-undergraduate. The table groaned with dried fruits and mandarin oranges. Faussett himself raised to his lips a glass of Oxford wine-merchant's sherry—our famous Amontillado as imported, thirty-six shillings the dozen—and observed in a tone of the severest criticism: 'Oh, the man's a smug; a most unmitigated smug: that's the long and the short of it.'

Now, to be a smug is, in Oxford undergraduate circles, the unpardonable sin. It means, to stop in your own rooms and moil and toil, or to lurk and do nothing, while other men in shoals are out and enjoying themselves. It means to avoid the river and the boats; to shun the bump-supper; to decline the wine-party. Sometimes, it is true, the smug is a curmudgeon; but sometimes he is merely a poor and hard-working fellow, the sort of person whom at forty we call a man of ability.

'Well, I won't go quite as far as that,' one of the other lads observed, smacking his lips with an ostentatious air of judicial candour, about equally divided between Dick and the claret. 'I won't quite condemn him as a smug, unheard. But it's certainly odd he shouldn't join the wine-club.'

He was a second-year man, the speaker, one Westall by name, who had rowed in the Torpids; and as the rest were mostly freshmen of that term, his opinion naturally carried weight with all except Gillingham. He, indeed, as a Born Poet, was of course allowed a little more license in such matters than his even Christians.

* Copyright 1892 in the United States of America by the Cassell Publishing Company.

'Up till now,' Faussett put in, with a candid air of historical inquiry, 'you see every Durham man has always as a matter of course subscribed to the wine-club. Senior men tell me they never knew an exception.'

Gillingham looked up from his easy-chair with a superior smile. 'I don't object to his not *joining* it,' he said, with a curl of the cultured lip, for the Born Poet of course represented culture in this scratch collection of ardent young Philistines; 'but why, in the name of goodness, didn't he say outright like a man he couldn't afford it? It's the base hypocrisy of his putting his refusal upon moral grounds, and calling himself a total abstainer, that sets my back up. If a man's poor in this world's goods and can't afford to drink a decent wine, in Heaven's name let him say so; but don't let him go snuffling about, pretending he doesn't care for it, or he doesn't want it, or he doesn't like it, or he wouldn't take it if he could get it. I call that foolish and degrading, as well as unmanly. Even Shakespeare himself used to frequent the *Mermaid* tavern. Why, where would all our poetry be, I should like to know, if it weren't for Bacchus? Bacchus ever fair and ever young? War, he sang, is toil and trouble; Honour but an empty bubble; Never ending, still beginning; Fighting still, and still destroying; If the world be worth thy winning, Think, oh, think it worth enjoying.' And Gillingham closed his eyes ecstatically as he spoke, and took another sip at the thirty-six Amontillado, in a rapture of divine poesy.

'Hear, hear!' Faussett cried, clapping his hands with delight. 'The Born Poet for a song! The Born Poet for a recitation! You men should just hear him spout Alexander's Feast. It's a thing to remember! He's famous as a spouter, don't you know, at Rugby. Why, he's got half the British poets or more by heart, and a quarter of the prose authors. He can speak whole pages. But Alexander's Feast's the thing he does the very best of all. Whenever he recites it, he brings the house down.'

'Respect for an ancient and picturesque seat of learning prevents me from bringing down the roof of Durham College, then,' Gillingham answered lightly, with a slight sneer for his friend's boyish enthusiasm. 'Besides, my dear boy, you wander from the subject. When the French farmer asked his barn-door fowls to decide with what sauce they would wish to be eaten, they held a meeting of their own in the barton-yard and sent their spokesman to say, "If you please, M. le Propriétaire, we very much prefer *not* to be eaten." "Mes amis," said the farmer, "vous vous écarterez de la question." And that's your case, Faussett. The business before the house is the moral turpitude and mental obliquity of the man Plantagenet, who refuses—as he says on conscientious grounds—to join the college wine-club. Now, I take that as an insult to a society of gentlemen.'

'What a lark it would be,' Faussett cried, 'if we were to get him up here just now, offer him some wine, to which he pretends he has a conscientious objection—unless somebody else pays for it—make him drink success to the cause of total abstinence, keep filling up his glass till we make him dead drunk, and then set him at the window in a paper cap to sing *John Barleycorn*!'

Gillingham's thin lip curled visibly. 'Your humour, my dear boy,' he said, patting Faussett on the back, 'is English, English, essentially English. It reminds me of Gilray. It lacks point and fineness. Your fun is like your neckties—loud, too loud! You must cultivate your mind (if any) by a diligent study of the best French models. I would recommend, for my part, as an efficient antidote, a chapter of De Maupassant and an ode of François Coppée's, every night and morning.'

It was Trevor Gillingham's cue, indeed, always to treat his fellow-students at Durham College as mere young Englishmen who had never seen anything of the great European world where he himself had received the rudiments of his education. *They* had not been brought up in the diplomatic service; *they* had not been hurried about the face of the Continent from Madrid to Constantinople, and from Stockholm to Athens: *they* had not picked up French with their mothers' milk, nor lispied in High-German from their earliest infancy. It was something, Gillingham felt, to have been dandled on the knees of Roumanian and Servian queens, or to have been held at the font by the orthodox hands of Russian princesses. And he never let his contemporaries at school or college forget his superiority in that respect. He had painted over his door with his own hand the proud words of the Psalmist, 'Reginæ erunt nutrices tuæ.' So he despised Faussett for not being as cosmopolitan and enlightened as himself, and he had a low opinion of Oxford altogether as a rather provincial English university.

Faussett, somewhat abashed, retired for a moment into himself. He busied himself meanwhile with handing round the mandarin oranges.

'Plantagenet's not a man of the world, you see,' Gillingham went on after a short pause, puffing away at a contemplative cigarette, with a proud consciousness that he himself was wholly different. 'That's not his fault, of course, and nobody blames him for it. The poet is born, not made, we know: it's perfectly true; but the man of the world is made, not born; he owes his qualities to the society in which he has been brought up, and the people with whom he and his forebears have associated. Still, when a fellow comes among gentlemen, no matter from what origin, he should "behave as sich;" he should have gumption and tact enough to find out instinctively what are the things one should do and what the things one should leave undone, so as to fit him for the superior groove in which he is thenceforth to hold his orbit. I hate unadaptiveness; it's a mark of a low unprogressive nature. The wise man moves with his time and adapts himself to his company. If he happens to be in Spain, he's a pillar of the bull-fights; *cosa d'españa*, you know—*cosa d'españa*! If he comes to England, he's a Vice-president of the Society for the Prevention of Cruelty to Animals. When he's at Rome, he does as Rome does; when he's in Geneva, he renounces the Pope and all his works as a most dangerous heresy.' And Gillingham leaned back in his easy-chair with a self-satisfied face, and blew forth a blast of pale blue tobacco smoke, conscious that he had spoken like a man of the world himself, and merited the admiration of his attentive listeners.

'But if Plantagenet's poor,' one more tolerant lad put in, apologetically, 'it's natural enough, after all, he shouldn't want to join the club. It's precious expensive, you know, Gillingham. It runs into money.'

The Born Poet was all sweet reasonableness. 'To be poor, my dear Matthews,' he said with a charming smile, turning round to the objector, 'as Beau Brummell remarked about a rent in one's coat, is an accident that may happen to any gentleman any day; but a patch, you must recognise, is premeditated poverty. The man Plantagenet may be as poor as he chooses, so far as I'm concerned: I approve of his being poor: what so picturesque, so affecting, so poetical, indeed, as honest poverty? But to pretend he doesn't *care* for wine—that's quite another matter. There the atrocity comes in: the vulgarian atrocity. For I call such a statement nothing short of vulgar.' He raised his glass once more, and eyed the light of the lamp through the amethystine claret with poetic appreciation. 'Now give the hautboys breath,' he cried, breaking out once more in a fit of fine dithyrambic inspiration; 'he comes! he comes! Bacchus, ever fair and ever young, Drinking joys did first ordain. Bacchus' blessings are a treasure; Drinking is the soldier's pleasure. Rich the tr-r-reasure, Sweet the pleasure; Sweet is pleasure after pain.'

And when Gillingham said that, with his studiously unstudied air of profound afflatus, everybody in the company felt convinced at once that Plantagenet's teetotalism, real or hypocritical, simply hadn't got a leg left to stand upon. They turned for consolation to the Carlsbad plums and the candied cherries.

But at the very same moment, in those more modest rooms, up two pair of stairs in the Back Quad, which Dick had selected for himself as being the cheapest then vacant, the Prince of the Blood himself sat in an old stuffed chair, in a striped college boating coat, engaged in discussing his critic Gillingham in a more friendly spirit with a second-year man, who, though not a smug, was a reader and a worker, by name Gillespie, a solid Glasgow Scotchman. They had rowed together that afternoon in a canvas pair to Sandford, and now they were working in unison on a chapter or two of Aristotle.

'For my own part,' Dick said, 'when I hear Gillingham talk, I'm so overwhelmed with his knowledge of life, and his knowledge of history, and his extraordinary reading, that I feel quite ashamed to have carried off the Scholarship against him. I feel the examiners must surely have made a mistake—and some day they'll find it out, and be sorry they elected me.'

'You needn't be afraid of that,' Gillespie answered, smiling, and filling his pipe. 'You lack the fine quality of a "guid conceit o' yoursels," Plantagenet. I've talked a bit with Gillingham now and again, and I don't think very much of him. He's not troubled that way. He's got an extraordinary memory, and a still more extraordinary opinion of his own high merits: but I don't see, bar those two, that there's anything particularly brilliant or original about him. He's a poet, of course, and he writes good verses; every fellow can write good verses nowadays; the trick's been published. All can raise the flower

now, as Tennyson puts it, for all have got the seed. But as far as I can judge Gillingham, his memory's just about the best thing about him. He has a fine confused lot of undigested historical knowledge packed away in his head loose: but he hasn't any judgment; and judgment is ability. The examiners were quite right, my dear fellow; you know less than Gillingham in a way; but you know it more surely, and you can make better use of it. His work's showy and flashy: yours is solid and serviceable.'

And Gillespie spoke the truth. Gradually, as Dick got to see more of the Born Poet's method, he found Gillingham out: he discovered that the great genius was essentially a *poseur*. He posed about everything. His *rôle* in life, he said himself, was to be the typical poet: and he never forgot it. He dressed the part; he acted it: he ate and drank poetically. He looked at everything from the point of view of a budding Shakespeare, with just a dash of Shelley thrown in, and a suspicion of Matthew Arnold to give modern flavour. Add a tinge of Baudelaire, Victor Hugo, Ibsen, for cosmopolitan interest, and you have your bard complete. He was a spectator of the drama of human action, he loved to remark; he watched the poor creatures and the pretty creatures at their changeful game, doing; loving, and suffering: he saw in it all good material for his art, the raw stuff for future plays to astonish humanity. Meanwhile, he lay low at Durham College, Oxford, and let the undergraduate world deploy itself before him in simple Bacchic guise or Heracleian feats of strength and skill.

Dick saw more of Gillespie those first few terms than of any one else in college. He was a thorough good fellow, Archibald Gillespie, and he had just enough of that ballast of common-sense and knowledge of the world which was a trifle lacking to the romantic country-bred lad fresh up from Chiddingwick. He helped Dick much with his work, and went much with him on the river. And Dick worked with a will at his history all that year, and pulled an oar with the best of them: though he found time, too, to coach a fellow undergraduate going in for 'Smalls,' which increased his income by ten whole pounds, an incredible sum to him. When he thought of how hard it used to be to earn ten pounds at Mr Wells's in the High Street at Chiddingwick, no wonder Oxford seemed to him a veritable Eldorado!

In spite of hard work, however, and frequent tight places, that first term at Oxford was a genuine delight to him. Who that has known it does not look back upon his freshman year even in middle life with regretful enjoyment? Those long mornings in great lecture-rooms lighted up with dim light from stained-glass windows; those golden afternoons on the gleaming river or among the fields towards Iffley; those strolls round the leafy avenues of Christ Church walks; those loitering moments in Magdalen cloisters! What lounging in a punt under the chestnuts by the Cherwell; what spurts against the stream on the river by Godstow! All, all is delightful to the merest full-blooded boy; to Richard Plantagenet's romantic mind, stored with images of the past, 'twas a perpetual feast of fantastic pleasure.

He wrote to Mary twice a week; he would have written every day, indeed, if Mary had

allowed him; but the lady of his love more prudently remarked that Mrs Tradescant would be tempted to inquire in that case as to the name and business of her constant correspondent. He wrote her frankly all his joys and griefs; and she in return quite as frankly sympathised with him. Boy and girl as they were, it was all very pleasant. To be sure, it was understood and arranged on both sides beforehand by the high contracting parties that these letters were to be taken as written on purely friendly grounds, and as the lawyers say, 'without prejudice;' still, as time went on, they grew more and more friendly, until at last it would have required the critical eye of an expert in breach-of-promise cases to distinguish them at first sight from ordinary love letters. Indeed, just once, towards the end of term, Dick went so far as to begin one short note, 'Dearest Mary,' which was precisely what he always called her to himself in his own pleasant day-dreams; and then he had the temerity to justify his action in so many words, by pleading the precedent of this purely mental usage. But Mary promptly put a stop to such advances by severely beginning her reply, 'Dear Mr Plantagenet;' though, to be sure, she somewhat spoilt the moral effect of so stern a commencement by confessing at once in the sequel that she had headed her first draught with a frank 'Dear Dick'—and then torn it up, after all, being ashamed to send it.

When Dick read that deliciously feminine confession, consigned in blushing ink to fair white maiden note-paper, his heart gave a jump that might have been heard in Tom Quad, and his face grew as red as Mary's own when she penned it.

THE CHINA TEA-CLIPPERS.

THE crimson flag of the British merchant service has flown at the peaks of many famous ships since it was hoisted aboard the first of the Black-wall Liners; but never has that glorious bunting 'terrific burned' over a more renowned fleet of vessels than the China Tea-clippers. The little 'fruiters' which raced home from South Spain and the Western Islands with the golden products of the orange grove and the raisins of the sunny Murcian vineyards, won great fame in their day. Such names as the 'Jack o' Lantern,' 'Susan,' and 'Lady Rebow' will kindle the heart of the old sailor, and carry him back in recollection to the period of his first going to sea, when he recalls the picture of those yacht-like clippers, streaming down the bay like a flight of graceful seabirds under their widespread wings of canvas. Dainty little vessels they were, to be sure; schooner-rigged for the most part, and wonderful sailers. But they seldom went farther than a week's run from soundings, and this, together with their slender size, prevented their ever attaining the significance which attaches to the great ship, rendered majestic to the eye by her towering heights, and heroic to the mind by the length of her voyages.

The tea-trade with China was first thrown open by our war with that nation in 1842. The

Americans then possessed a magnificent fleet of sailing-ships, hailing chiefly from Boston and Baltimore, which no British vessel afloat could rival. Our ocean liners at that period were of the old frigate-built school; bluff, homely craft, very dry and comfortable to be on board of in a gale of wind, but never celebrated for their speed. The Yankees, on the other hand, were introducing the new form of clipper-building into their yards; and the vessels which, in 1845-46, they despatched from New York to the Whampoa were not to be surpassed, indeed, scarcely approached, by anything that we could send to compete against them. Then, again, by first carrying a cargo to California, which paid them something like five pounds a ton, it answered their purpose to cross to the Chinese ports, load with tea, and bring it to the Thames or Mersey at a rate which it would have ruined our shipowners at home to accept. Thus it was that for the first few years in the history of the China tea-trade the Americans practically enjoyed a monopoly in supplying the markets of the world.

But British enterprise was not very likely to sit down long under this state of things. Others were reaping the fruits which we had shed our blood in China to secure. The Navigation Laws had been repealed; Free Trade was in operation, and it seemed strange that with these great commercial advantages we could not successfully compete against the Americans. What was wanted first of all was for our shipwrights to turn out vessels that could hold their own against the Yankee ships. Brother Jonathan gave us the idea of clipper-building, and we were not above borrowing it. By way of experiment, Messrs Hall of Aberdeen constructed a large schooner on the lines of the famous Baltimore clippers, named her the 'Torrington,' and in the year 1846 sent her to engage in the coasting-trade with China. Her voyage proved such a success, that other vessels of the same class, but of greater burden, followed in quick succession. The 'Torrington' was the first of the British China clippers: the vessels which had preceded her, such as the 'Euphrates,' 'Foam,' 'John o' Gaunt,' and the 'Monarch,' were all of the type still known among sailors as 'tea-wagons.'

For quite ten years after the launch of the 'Torrington,' however, the Americans remained our masters in this particular trade. When they found that we had begun to compete with them, their builders went to work to construct the magnificent set of ships which may be described as belonging to the later Baltimore clipper school. There was nothing afloat under British bunting to rival such vessels as the 'Challenge,' 'Sea Witch,' 'Oriental,' and at least a score of others. Occasionally, one of our ships would beat a celebrated Yankee clipper; but these triumphs were so few that they merely served to accentuate the superiority of their craft over our own. For instance, there was the memorable race from Whampoa to the Thames in 1851 between the two Baltimore clippers 'Flying Cloud' and 'Bald Eagle' and the English ship 'Ganges.' The former vessels sailed three days ahead of the 'Ganges.' A great deal of excitement was created in China by the race, the Americans, from their prestige, being the universal favourites. The south-west monsoon was strong, and the 'Ganges'

made a long passage to the Sunda Strait; but, when she passed Anjer signal station, nothing had yet been seen of her rivals. She arrived in soundings on December 16th, after a passage of one hundred and eight days.

A well-known Aberdeen ship-owner who was on board at the time tells the story of the race up Channel in Lindsay's *History of Shipping*. 'On the following morning at daylight we were off Portland, well inshore and under short sail, light winds from north-east, and weather rather thick. About eight A.M. the wind freshened and the haze cleared away, which showed two large and lofty ships two or three miles to windward of us. They proved to be our American friends, having their stripes and stars flying for a pilot. Captain Deas at once gave orders to hoist his signals for a pilot also; and as by this time several cutters were standing out from Weymouth, the "Ganges," being farthest inshore, got her pilot first on board. I said that I would land in the pilot boat and go to London by rail, and would report the ship that night or next morning at Austin Friars (she was consigned to my firm). The breeze had considerably freshened before I got on board the pilot cutter, when the "Ganges" filled away on the port tack, and, contrary to his wont, for he was a very cautious man, the captain crowded on all small sails. The Americans lost no time, and were after him, and I had three hours' view of as fine an ocean race as I can wish to see. The wind being dead ahead, the ships were making short tacks. The "Ganges" showed herself to be the most weatherly of the three; and the gain on every tack inshore was obvious; neither did she seem to carry away behind in forereaching. She arrived off Dungeness six hours before the other two, and was in the London Docks twenty-four hours before the first, and thirty-six hours before the last of her opponents.'

It was much about this period that the famous China house of Jardine, Matheson, & Co. caused to be constructed for them a ship with lines quite as fine as those of any American craft afloat, and of stouter scantling. She was named the 'Stornoway,' and was the first of the far-famed race of Aberdeen clippers. The 'Chrysolite,' a ship of very similar type, was launched shortly afterwards. But these vessels were scarcely equal to holding their own against the Baltimore clippers, few of which were less than double their tonnage. Our shipbuilders, however, were experimenting in the right direction, and gaining in confidence. Their next attempt was a vessel called the 'Cairngorm;' she proved herself not only a swift sailer, but a staunch ship, and by delivering her cargo in superior order, speedily obtained a preference over her American competitors. The English ship-owners began to grow hopeful again. In April 1853 the 'Joseph Fletcher' arrived in the Thames, one hundred and four days from Shanghai. This was the swiftest passage yet made by a British tea-clipper, and created a good deal of enthusiasm.

But it was not until the year 1856, when the 'Lord of the Isles,' one of the earliest iron vessels built in this country, raced home from Foochow against two of the most famous Baltimore clippers of the age, and beat them both by some days, that our ships re-established their ascendancy in a trade which the Americans had long been

bidding fair to monopolise. From this time the stately Yankee craft began to disappear one by one from off the seas, followed by the regretful memories of many British jacks, who had loved the honour of rivalling such ships and such sailors as those which dashed across the oceans under the stripes and stars during the two middle decades of the century. The revolution of the wheel of fortune was slow, but complete. Between the years 1845 and 1855 British merchants were chartering American clippers to bring freights of tea from China to supply the London markets: not more than twenty years later, nearly the whole of the tea imported into the United States was carried by English ships. That we drove the Americans out of the trade by our own superiority no one would be so foolish as to affirm. Had they chosen to continue competing with us, there is no doubt that they would have sent forth ships quite capable of giving a good account to the most celebrated of our own clippers. As seamen, we at least admit them equal to ourselves; as shipbuilders they taught us many valuable lessons.

In 1860 we had got the great bulk of the China tea-trade into our hands again, and a fleet of famous vessels was gradually springing up in this traffic. There was the 'Challenger,' specially built by Mr Richard Green, ten years earlier, to compete with the Yankee clipper 'Challenge,' which she was most successful in doing; the 'Falcon,' 'Kate Carnie,' 'Crest of the Wave,' 'Spray of the Ocean,' and several others whose names are quite historic in the annals of our mercantile marine. But by the time our Yankee neighbours had ceased to be rivals to us in this particular trade, a keen competition had sprung up among our own ship-owners. Freights in the tea-trade usually ruled very high; but in addition to this, extra inducements were held out to the owners of swift ships in the shape of racing premiums, and heavy prizes for the earliest deliveries. The result was that China clipper-sailing, stimulated by such strong commercial considerations, grew into a sort of mania: the builders were put to it to produce vessels which nothing afloat could touch, and as a consequence they launched a set of ships of such beauty, and possessed of such extraordinary sailing qualities, that the world had never seen their like before. Steele of Greenock and Hood of Aberdeen were particularly famous for the clippers they turned out. The first-named firm it was that, in 1865, sent forth the 'Sir Lancelot,' the pride and wonder of the whole race of tea-clippers.

This ship went manned by a crew of thirty hands, commanded by Captain Richard Robinson. It was in the season of 1869 that the 'Sir Lancelot' made the swiftest passage ever recorded of any tea-clipper. She left the anchorage at Foochow on the 17th of July with a full cargo of tea for London; and on the 10th of October sighted the Lizard, and entered the English Channel. Four days later she was berthed in the West India Docks, having completed a voyage of nearly 15,000 miles in eighty-nine days, and maintained an average of over one hundred and sixty miles a day through all the vicissitudes of weather which every ship meets with upon a long ocean passage.

This voyage of the 'Sir Lancelot' was ten days

quicker than those of the 'Serica,' 'Ariel,' and 'Taeping' in the great homeward race from Foochow of 1866, and eight days quicker than the celebrated passages of the 'Spindrift' and 'Ariel' in 1868. The nearest approaches to it are the runs made by the clippers 'Thermopylæ,' 'Titania,' and 'Halloween.' The first-named ship came home from Foochow to London in 1869, sailing about five weeks before the 'Sir Lancelot.' She was making her maiden voyage, upon the outward passage of which she had covered the distance between Melbourne and the Thames in sixty days. She then crossed to Shanghai in twenty-eight days, the quickest run on record. Leaving Foochow shortly afterwards, this wonderful vessel accomplished the voyage to London in ninety-one days. The 'Thermopylæ' was one of the Aberdeen clippers; she was about sixty tons larger than the 'Sir Lancelot,' although built very much upon the lines of that vessel. The 'Titania,' a Greenock-built ship of a less burden than either of the two foregoing vessels, made a famous passage in the race of 1871. Perhaps none of the China clipper-matches excited more interest than this particular one, because of the notoriety of the ships engaged in it. The 'Thermopylæ' left Shanghai on June 22d; the 'Forward Ho' sailed from the same port two days later; and the 'Undine' on the 27th. On the 1st of July the 'Titania' left the anchorage at Foochow, by which time the first of her competitors had got the start by the whole length of the China Sea, and the other two were many leagues ahead. Notwithstanding this, the 'Titania' arrived in the Thames on the 2d of October after a passage of ninety-three days, the 'Thermopylæ' coming in on the 6th, the 'Undine' on the 16th, and the 'Forward Ho' on the 20th of the same month. The 'Halloween' was another of the swiftest of these famous ocean racers. In 1874 she made a memorable passage: eighty-nine days from Shanghai to Deal. But this extraordinarily quick voyage is perhaps partly attributable to the fact of her having sailed at a time of the year when the monsoon was strong and favourable, whereas the usual period for the leaving of the China fleet was between the months of May and August, during which the monsoon is adverse. The 'Halloween' was one of the very few China clippers ever built upon the Thames. She was launched at Greenwich in 1870, and was a most beautiful model, of nine hundred and twenty tons burden.

The China clippers were a fine school for seamen. The greatest dexterity of navigation was called for in sailing these crack ships. If a man were reckless, and permitted his desire to 'carry-on' to get the better of his judgment, he stood to dismast his ship and hopelessly ruin his chances of a smart passage. Mishaps were frequent. Studding-sail booms and skysail poles were carried away with as little compunction as a sailor would feel in snapping the stem of a clay pipe. The 'Cutty Sark,' whilst racing almost neck to neck with the redoubtable 'Thermopylæ' in 1872 lost her rudder off the Cape; yet she contrived to arrive in the Thames only a week behind her competitor. Occasionally one of the most notorious of the racers would make an inordinately long passage. The 'Challenge' in 1869 was one hundred and forty-eight days in

coming home from Shanghai, having been exceptionally unfortunate in the weather she met with. In the previous year she had occupied one hundred and thirty-one days in making the same passage, the 'Forward Ho' one hundred and twenty-eight days, and the 'Titania' one hundred and twenty-six days. This was the season (1868) when one of the greatest of all these ocean regattas was run. Between May 28th and May 30th, six ships started—five from Foochow, and one from Whampoa. They were the 'Lahloo,' 'Taeping,' 'Ariel,' 'Spindrift,' 'Sir Lancelot,' and 'Undine.' Never was there a more exciting match, saving, perhaps, the race of 1871. Heavy wagers were laid, and the progress of the ships most eagerly watched as they passed the various signal stations. Then they were lost sight of for a long while; until one fine morning from the summit of the Portland cliffs were seen two stately-looking vessels in the offing, sweeping up Channel under a prodigious spread of white wings. 'The first of the China clippers!' went the cry; and the news was wired to London and circulated among the excited brokers of Mincing Lane before even the numbers of the distant ships had been made out. They proved to be the 'Ariel' and the 'Spindrift,' ninety-five days from Foochow; and forty-eight hours later they were both snugly berthed in the London Docks.

But from the day in 1863 when the steamship 'Robert Lowe,' of 1250 tons, commanded by Captain Congalton, left Hankow loaded with teas for London, the China clipper was doomed. She held her own for at least twelve years after this; but her knell had been sounded by the screech of the 'Robert Lowe's' siren, and her disappearance was only a matter of time. A few of these beautiful vessels still survive, but they are no more than the relics of a vanished type. When the last of them goes, she will carry with her the tender recollections of a race of sailors who are rapidly growing fewer; and as the old salt turns from the shadowy memory of some gallant spectacle of swelling canvas and rushing hull to the sight of the modern wall-sided steamboat, thrashing along deep with the first of the season's teas, he may well be excused for heaving a sigh in lament of the China clippers.

BABY JOHN.*

CHAPTER III.—BABY.

'Where did you come from, Baby dear?'

'Out of the everywhere into here.'

'Where did you get your eyes so blue?'

'Out of the sky as I came through.'—G. MACDONALD.

IN the old days before Lucy was married—not such very old days either even now—she used to talk of all she should do when Alice came to stop with her in the beautiful house that her rich husband was going to give her; and the two girls would laugh, and try to imagine, what was really inconceivable to them both, being waited on by servants, and not having to put their hands to anything. Alice, to be sure, had sighed as often as she laughed, having a foreboding of the separation this marriage would make between them; but now, here it was actually come to

* Copyright 1892 in the United States of America by Roberts Brothers.

pass, only far more delightful than the brightest and wildest anticipations.

No fine servants to awe and trouble them, no critical eyes or ears to note what they did and what they said, not even the grand husband to throw the shadow of his presence on their sunshine; there they were, those two together, in what seemed to Alice splendid luxury, though Lucy, more accustomed to her surroundings by this time, used to try to convince her that it was nothing like so fine as the drawing-room; and she used to incite Alice to steal down and have a peep just to see the pictures and the big looking-glasses and the piano and all. The nurse did not stay very long after Lucy began to recover; but though it was delightful to be alone, they had both grown so fond of her that they quite regretted her leaving, and Lucy cried when she kissed her, and said, 'Ain't she a dear? bless her!'

The doctor came every day, but he was so kind and so pleased to see Mrs Craddock slowly but surely recovering her strength, that his visits were quite a pleasure.

And then it seemed to Alice that everything that heart could wish was to be arrived at by just ringing the bell; and there was a smiling, rosy-faced, country girl who brought up what was wanted, who was not so alarming as the tall parlour-maid, who, however, now was very different when she came in contact with Alice, having had impressed upon her by master, doctor, and nurse, that it was as much as her place was worth to make herself unpleasant to the person who had seemed to call back Mrs Craddock from the very gates of death.

I will not undertake to say that she did not vent her feelings freely in the kitchen at the indignity of having to wait on a common, low, mill-girl, she 'as was used to gentle-folks, and only came to Mrs Craddock just to oblige, as she wouldn't stop beyond her six months were it ever so, though they went on their bended knees and doubled her wages.'

But Jessie, the under-housemaid, had none of these dignified feelings, nor had she been so long in service as to be shocked at sundry little fancies in the sickroom which Travers, the parlour-maid, would have known at once were not such as ladies, even in their moments of greatest unbending, gave way to, such as a bit of fresh watercress for tea—I think they called it 'crease,' and spoke of having it 'to' their tea—or even twopennyworth of periwinkles, over which, I am sorry to say, the doctor surprised the two girls.

Though he shook his head doubtfully over the desirability or digestibility of such food, he was yet fain to condone it for the sake of the peal of laughter that greeted his ears as he opened the door, and the bright look on Lucy's pretty, delicate face as she held up in triumph on a large pin, for Alice's inspection, a curly, black body which she had successfully extracted from its shell.

But I have not mentioned the greatest and most entirely satisfactory delight of that bedroom at Apsley Villa. In all their anticipations of Alice's visits to Lucy after her marriage, they had never included in the delightful programme a real, live, little baby, Lucy's very own baby, and so by natural consequences more than half Alice's; the dearest baby, with tiny hands and

wonderful little feet, with toes like dainty shells, and a small face, over which the two girls pored with an admiration that was almost worship.

Baby had a soft down over the head that was a delight to touch, and of which Alice and Lucy talked as if it were abundant tresses that might be plaited or curled or otherwise arranged according to the latest fashion—in fact, it was just such a baby, neither more nor less, as the many thousands of little babies born every day, as seen by their mothers' eyes.

The two girls wanted no other occupation or interest all day and all night long; but the baby did not undertake to afford active amusement for more than two or three hours out of the twenty-four, being a placid creature and much addicted to peaceful slumbers, which his mother and Alice reluctantly agreed were better in the pretty bassinette than in the arms of either of them.

The only time during the day when a sense of uneasiness or constraint came into the pleasant atmosphere of the room was in the evening, when the door-bell rang and they knew the master of the house had returned. He went off too early in the morning to disturb his wife, though as a matter of fact she was always awake, and gave a little sigh of relief when she heard the door close after him. He did not come in in the middle of the day, but went to his mother's for his luncheon; but in the evening, when he came in from the mill, he always came up to his wife's room for a few minutes, and Alice went away and left them together.

Lucy might have been quite gay and like her old self all the afternoon, but as soon as his ring came at the door, her spirits seemed to die away, and she began to feel languid and tired, and her voice sounded dull and weak. These interviews were never very long, and Alice fancied there was as much relief in the step that went downstairs as in the face she found lying back among the pillows.

At first Lucy said nothing about her husband to Alice, and Alice asked no questions; but as the days went on, and Lucy was gradually regaining strength, and each day saw some slight step towards convalescence, which must needs put an end to this happy, peaceful existence, she began to talk of those eighteen months of married life, of which Alice knew so little, and to fret over the prospect of going back to what it had been before.

'I don't want never to get well, Alice,' she would say; 'no, nor he don't wish it neither. When I was so bad, before you came, and made sure I was going to die, I used to say to myself, well, anyhow, I'll be out of my way.'

'Weren't he kind to you?'

'Well, he weren't so to say unkind. I sometimes thought I'd a deal rather that he were. Don't you mind, Alice, that Sarah Giles, whose husband knocked her about so—he were a brute—and yet, when they'd made it up after one of them breezes, there she'd be setting on his knee with a black eye maybe, as he'd given her, and she'd fight the first that said a word against him. Well, mine was sick to death of me, and just put up with me the best he could. I don't know why ever he wanted to marry me for. I'd never have thought of it. Why couldn't he a-let me be?'

'Were the old lady nasty to you?'

'No, she'd a-liked to be, but he wouldn't have that, and we didn't see much of her. When I was ill, she came and sat up with me one night, but I'd a deal rather have been left alone. She kep' sighing and shaking her head, and muttering to herself, for she's terrible pious, but I knew she'd rather by a long way I died; and she said once when she gave me a drink, as we did ought to be resigned, if it was the will of the Lord. But there! I couldn't help thinking it's not so easy to be resigned when one's real fond of any one. You wouldn't a-been resigned, would you, my darling? not easy like, would you? And she were a bit too willing to think it were the will of the Lord to take me out of her son's way, as if it weren't never the will of the Lord to be kind and let one live. But there! I'm beginning to think I'd be as resigned as she is if I was to go now we've had this nice little time together, you and me, as must come to an end sooner or later. Oh, Alice, don't you wish it could go on just as 'tis for ever, just you and me and baby, baby and you and me? But I can't a-bear to leave him. I'd like to take him with me, bless him! him and you, if we could all go together. There! he's wakin'! Give him to his mother.'

The mere thought of recovery retarded its progress: the doctor's suggestion that she should come down-stairs for an hour sent up her temperature; and a proposal that, if the weather continued so bright and mild, she might go for a drive before long, took away her appetite, and made her languid and depressed.

I think the doctor divined the cause of these relapses, and felt sorry for the girl who clung so to the old friend of former years, and yet he felt that the situation could not be prolonged indefinitely, and that, as soon as Mrs Craddock was sufficiently recovered to go back to ordinary life, Alice's presence at Apsley Villa could not fail to be an embarrassment.

For Alice—even though she wore her Sunday dress every day, and with tidy collar and cuffs and smooth hair, did not look so rough and wild as she did on the first night of her arrival—would never look like anything but a mill-girl, nor would she if she had consented to Lucy's constant entreaty that she would take some of the dresses hanging in the wardrobe and alter them to fit herself. She absolutely refused to take anything, though it gave her continual amusement to explore the treasures that wardrobe contained, and spread out the dresses about the room, and discuss the colour and material and style, and the occasions on which each had been worn, giving Lucy for the first time some enjoyment in her various possessions.

Lucy, like most pretty girls, had been fond of a bit of finery in the old days, when a new ribbon meant sometimes going without butter on her bread, and a smart wing for her hat had to be saved up for for weeks; so Alice was quite surprised to find how little pleasure all these pretty things seemed to have given her, and how she hardly seemed to remember all the trinkets that lay in her drawer in the jeweller's boxes and pink cotton wool, looking as if they had hardly been opened since they were given; while a little trumpery gilt locket with A on it, which Alice had given her once on her birthday, was

treasured, and had evidently been worn on a little real gold chain which belonged by rights to a handsome pendant set with pearls.

'I wouldn't lose that,' Lucy said, 'were it ever so! I dropped it one day on the stairs, and my! didn't I make a racket till it was found. I remember so well the day you gave it me, and how it took me all by surprise, you kept it so close. You *was* sly, and pretended you hadn't a penny to spare for a present, and you was so sorry; and I was quite took in, and said, "Never mind, I didn't want no present;" and there! when I woke in the morning, was the little box on the pillow between you and me, and you pretending to be asleep, only I could hear you smiling in a whisper.'

Lucy had learned to talk better English than this during her married life; but when she was with Alice, she fell back into the old forms of speech, for there were no critical ears to listen, or eyebrows to rise, or mouths to twitch with irritable or patient endurance.

It was the doctor who suggested the idea that a change was what Mrs Craddock wanted to set her up again; and proposed she should go to Beston, a little place on the east coast.

'Of course, you couldn't get away from business,' he said to Mr Craddock. 'Why don't you get that girl to go with her, and take care of her and the baby? She'll want a good deal of care for some time yet, and that girl is a capital nurse, and has a head on her shoulders, which is not such a common thing among women.'

So one evening, when Alice came back into the room after a longer than usual interview between the husband and wife, she found Lucy, not as she expected tired and depressed, but with bright eyes and eager face; not stretched limp and languid on the sofa, with her face turned away from the light, but standing at the open wardrobe, reaching for a box on the top shelf, to see if a certain hat would do to wear at the seaside.

'Oh, Alice, only to think! it's too good to be true, you and me and baby—only us three—he's not going, he can't leave the mill. When he first began to talk of it, I thought he meant to go too, and I felt so bad, just as if it would be the death of me; but when he said he thought you and me might manage if he couldn't get away, I could almost have given him a kiss, I was so pleased, or got up and danced for joy. You've never seen the sea, Alice, and you'll love it, that you will, and so shall I. He took me to the sea once, but I didn't care a bit about it; there wasn't any one to talk to, or say what I thought of it, and I was fretting to come back and see you, or anyhow have a chance of seeing you. But only to think of you and me all to ourselves. We're to have lodgings; it will be just like old times, only no horrid old mill, and we shall do just what we like all day long, and have baby to ourselves.'

That was the culmination of everything, heightened by the dread that had been growing as she grew better, that a regular nurse would have to be engaged for her darling—a grand, frightening nurse like Travers, who would take the baby clean out of her hands, and keep him shut up in a nursery where his mother would only be admitted on sufferance, and who would absorb all the exquisite delights of washing, and feeding, and rocking him to sleep.

'Do you think he noticed as you didn't care to go as long as he was going?'

Mr Craddock was always spoken of as 'he' between the girls; the only other he who was ever mentioned being baby, and the personal pronoun in his case was spoken in such a different tone, that there was never any mistake as to who was meant.

'Noticed? Not he. Bless your heart, he don't care!'

But 'he,' going heavily down-stairs to his solitary dinner, said to himself, 'She will be glad to get away from me, poor child!'

DREAMS AND PERCEPTIVE ILLUSIONS.

DREAMS form a world of their own, with no discoverable links binding them to the other facts of human experience. The very name suggests something far distant and shrouded in mystery; to the memory phantoms and apparitions are conjured up; the sleeper feels he has been the actor in scenes no less real than those of waking moments although the sights and sequence of events are of an unknown realm. The mind not drawing its knowledge from without will be free to follow the wildest play of the imagination, and will reflect the individual's temperament and mental history. The interpretation of the different sensations will depend on the sleeper's character, for during sleep every man has a world of his own, although when awake we all have a common world.

Authorities differ as to whether the nerve-centres are ever so lowered as to break the continuity of our conscious life. While the metaphysician holds that the soul as a spiritual body can never be inactive, the psychologist and physiologist teach the doctrine of deep unconscious sleep. Against the theory of unbroken mental activity it is urged that many never dream. This objection may be answered by remembering that our sleeping life is so different from our waking life that what occurs in the former may readily be forgotten in the latter. The fact that on being suddenly roused most persons are found to be dreaming, is probably due to the dream being developed during the moments of awakening. A man may resolve to awake at a certain hour, and succeed in doing so, but his success is mainly owing to his being in a state of mental perturbation which renders him liable to be disturbed by slight stimuli. The truth appears to be that a minimum degree of intensity is always present in the nervous substance, and this is especially the rule where we lose all recollection of the dream. We awake in the night, the remembrance is clear; in the morning, all trace has disappeared.

The brain is not only the organ of thought, but it equally stimulates and directs our whole body during our waking moments. In sleep, however, the brain is relatively torpid, and the movements taking place then almost entirely depend upon the spinal cord and peripheral ganglia, the brain retaining its conscious and automatic actions, although losing its stimulating

power. By physiologists the spinal cord is regarded under a twofold aspect: it is a conductor, and transmits messages to the brain, and brings back the motor excitation; as a nerve-centre it is the seat of reflex action, and these reflex actions are automatic, unconscious, and co-ordinated. Reflex actions are movements in parts of the body brought about by sensations coming from that part and acting through the intermediary of some nerve-centre other than the brain. The reflex act is physiological, and differs from the intelligent act, which is psychological, in the fact that the former is unconscious and the latter conscious. Some authorities state that 'where there can be no consciousness because the brain is wanting, there is, in spite of appearances, only mechanism.' Others observe: 'Where there is clearly selection, reflection, and physical action, there must also be consciousness in spite of appearances.'

Dreams are classified with hallucinations, as they have no basis of actual impression for their starting-point; whereas illusions have, and the parallelism between dreams and insanity has been pointed out by Kant, who remarks 'that the madman is a dreamer awake.'

The day-dreams and castles in the air built by every one of an imaginative nature are far more extravagant than the false beliefs of the insane; with the sane however, the dream scenery does not last long and the stimulus of light and sound soon dissolves it. A nightmare gives us a very good idea of what an insane delusion is like. The ancient Greeks believed that their dreams were pictures laid bare to the eye of the soul by some of the gods. The African savage holds that in dreaming his higher self then travels to unfamiliar lands; the North American Indian believes that man possesses two souls, and during sleep one remains in the body, while the other rambles at pleasure through unknown regions; the Dyak, that there is one soul which is absent during sleep, and that the dreams represent what is seen by that soul in its wanderings. Others believe that dreams are sent by the good spirit presiding over our destiny to warn us of an impending danger; and many to-day hold this view, although modern science, by careful study of the close connection existing between mental life and bodily operations, has attempted to solve the problem by proving that our dream-imagery is mostly drawn from our every-day experiences. The power which cements into a coherent mass our disconnected dream-images is called 'creative fancy,' and this is said to be derived from the fantastical force of the soul.

Internal or external nervous stimulation is a great source of dreams. Scherner relates the case of a love-sick youth who was allowed to whisper his name in the ear of his obdurate mistress whilst she slept, with the result that she contracted the habit of dreaming of him, which led to a happy change in her feeling towards him.

A cold foot suggests an image of ice and snow. Moonbeams will sometimes lead those of a highly religious temperament to believe that they are visited by angels. Over-eating at supper will cause dreams of a terrifying nature. The sensation of being grasped by some invisible being is due to the sleeper seizing his own arm.

When we attempt to flee from some approaching danger, and cannot, the limbs are lying in an awkward position, and a certain amount of muscular strain is present. The horrible feeling of falling down from some height is caused by the involuntary extension of the sleeper's foot. Change of pressure on the retina will develop lovely plains bedecked with beautiful flowers and tenanted by birds of gorgeous plumage. Where we believe we are being crushed by some great weight, the cause is most likely due either to the closeness of the air or the mouth being covered with the bedclothes. The throbbing of an aching tooth has been mistaken for the stride of an avenging giant. If our skin is acting abnormally, and at the same time there is a subjective visual stimulus, the resultant is a combination of both; and we imagine there is an insect creeping over us. If a tale rivets our attention it tends to awaken a vivid recollection of the facts disclosed, and may thus easily lead to a dream. It is not only one's own daily experiences which supply the ground-work of our dreams, but the thoughts communicated by others to us are also woven into the scenery of our sleeping life, and this is advanced to explain the peculiar fact of our dreaming of persons or places of which we have no individual experience.

I am inclined to believe, however, that in dream-imagery the delicate threads and shadowy strands of hereditary memory, which in our waking moments are prevented from acting by the energy of the coherent groups of impressions received from the world by our sense organs, now make known their concealed power. Strange forms are visible; events not known to us in waking life are seen to follow one another in regular order, and careful reflection will not bring to light any link that will connect them with our waking hours.

We have most of us at times felt a sense of familiarity on visiting a new locality, although we cannot recall when, where, or under what circumstances we have before seen it. Is it too much to ask one to believe that in such a case our memory is restoring some fragments of our past ancestral life?—perhaps of a time even as remote as when our ancestors used small lozenge-shaped arrow-heads and a hatchet made of flint!—a period when the mighty Mammoth and the Cave-bear roamed in almost undisturbed freedom through the primeval forests!

Perceptive Illusions are false or, rather, mistaken perceptions of the senses: something is seen or heard; but that which the person thinks he sees or hears is not real but false. An hallucination is also a false perception of the senses, but is entirely subjective and is not due to any excitation from the outer world. Thus, when a man sees a stump of a tree and mistakes it for an apparition, he is suffering from an illusion; but if there is no stump, and he pictures to himself the ghost, he is the victim of an hallucination. I am not here discussing the truth of the theory of the idealist, who looks upon those who believe in an external world as existing and not depending on our perception of it, as suffering from a grand illusion of sense. The real, I hold, is the truth, as it exists for average man, free from individual bias and special circumstances favour-

able to error. When a person says of an object that it is a tree, we know what he means, whether it involves an external fact or is illusory. Optical illusions, which are caused by the reflection and refraction of light, are not peculiar to the individual, but arise in all when placed under similar conditions. A stick half immersed in water always looks broken, simply on account of the bending of the rays of light.

As far as the appearance of images and their mode of action are concerned, the waking state is similar to the dreaming. In the former condition the images are not objective; they appear and disappear by the immediate association of ideas, time and space being modified as they are in dreams; but whereas in dreaming the things seen are supposed to have a real existence, in waking they remain ideas. It occasionally happens, however, that these ideas do not remain as mere thoughts, but become so intense that they are held as real; and this result is more likely to take place when we abandon ourselves to a deep train of thought, and being absorbed are by our inattention unconscious; and the same condition of mind is established as in dreaming. When thinking of persons or places they are often imaged before us with such distinctness that we are startled. These vivid but momentary hallucinations are not morbid, for they are seen by those who are sane but happen to be strongly excited by anger, sorrow, or hope. Dante, Milton, Goethe and others gifted with an intense imagination, unconsciously regarded as real the characters they created. Talma declared that he was able to transform his audience into skeletons, thereby giving greater force to his acting; and Abercromby relates the case of a man who could, by strongly fixing his attention, call up any vision with such vividness that it seemed real. Thus, then, there is no hard and fast line between sleeping and waking.

All forms of illusions are due to carelessly performed synthesis, as when a man on a hot summer's day looks in a stream and 'sees' the delicious coolness, thus performing an act of imaginative construction. To the impression which his sense of sight gives him he adds what prior experience has bequeathed to his mind. 'In perception,' says Sully, 'the material of sensation is acted on by the mind, which embodies in its present attitude all the results of its past growth.'

The state called 'hypnagogic hallucination' is that in which the images appear to be real although the subject is still partially awake. Every thought then assumes body and form, and when awakening from a vivid dream, the figures of our dream are sometimes seen moving and projected against the wall.

The following is a good example of an illusion. 'On a small three-legged table beside my bed,' says Vignole, 'there was a little oval mirror, on which hung a woman's cap, which fell partly over the glass; there was also an easy-chair, on which I had thrown my shirt before going to bed, while my shoes were as usual on the floor. I awoke towards morning, and as I chanced to look around the large room in the uncertain light of a night-light which was almost burnt out, my eyes fell upon the easy-

chair. Immediately I seemed to see a head above it, corresponding to the mirror, and a vague confused image of a person seated there. . . . On further examination, the face and person stood out more clearly, and the features became more distinct the longer I looked. Finally I saw before me a man dressed in white, of an athletic form, sitting on the easy-chair, and looking fixedly at me. . . . The image appeared to me so real and distinct, that on rising from the bed and gradually approaching it, its form did not vanish even when I was near enough to touch the object which produced it. An analysis showed that the features, limbs, and position corresponded in every point with the folds and relative position of the articles of dress which had formed it.'

A like mistake in an imaginative individual would lead to the firm conviction that an apparition had been seen.

To be the victim of an illusion is, according to some, a sufficient reason to be excluded from the circle of sane men; but the careful observer knows that this is not true, for momentary fatigue or relaxation of attention will prevent the perceptions being rational; and it is not only in the undisciplined mind of the savage that we find illusions prominent, but also in the cultivated intelligence of civilised communities. Most of us, when we have allowed our imagination free play, have detected images of animals in the clouds; and it is no unfamiliar experience to be called upon to observe likenesses to the human form in mountains and rocks: these occupations are favourite ones with the insane. The explanation is that there is a tendency to regard any object of perception as subjective and causative, and the mind, which is unconsciously exercised, constructs a resemblance of the image already impressed on it. All faint sensations are liable to be wrongly classified, and it is in these hazy impressions that most illusions take their rise. Thus, when looking through a window at some distant object, a fly on the pane may be mistaken for a bird. When there is an echo, we sometimes fancy our call is answered by some one else, and this is because, by a process of suggestion, the second sound brings before us the image of a second shouter. Cold and smooth surfaces frequently appear to be wet, and this is due to the confusion of two impressions when near each other, wetness being a compound sensation, consisting of touch and temperature; as the feeling is caused in the majority of cases by surfaces moistened by a cold liquid, we speak of it as a sensation of wetness.

If a train is travelling quickly, and we watch the apparent motion of the landscape, when we look at some stationary object, as the carpet, it seems to move in the contrary direction, this being due, according to Helmholtz, to the tendency of the sense organs to go on doing what has already been done, and that while we fancy we are looking steadfastly at the carpet we are in reality moving the eye over the surface. On looking at the stormy clouds on a moonlight night it is the moon that seems to scud along; and it is only when we fix our gaze on her that we observe that she is stationary. Wundt suggests that experience has made it far easier for us to think of small objects like

the moon moving rapidly than of large masses like the clouds.

If a nervous stimulation is continued for a lengthened period, it ceases to have any effect: the noise of a mill is not heard after a time, and perfect silence is the result. A man who has had his leg amputated frequently has some sensation arising which he refers to the lost member, and this is due to sensation arising at the sensory centre, and not by excitation of the peripheral fibre. If we hit the ulnar nerve at the elbow, we feel the tingling in the fingers, and not at the seat of injury.

The imitation of solidity and depth in painting is a curious illustration of the mode of production of illusions. Some pictures will give the eye a representation of a scene in which the objects have the distinctness of proximity with the magnitude of distance. According to Helmholtz, a picture representing a Bedouin's white garment in brilliant sunshine will, when seen in a fairly lit gallery, have a degree of luminosity reaching only to about one-thirtieth of that of the actual object; whereas a painting representing marble ruins illuminated by moonlight would in the same gallery have a luminosity ten to twenty thousand times greater than the reality. The observer does not, however, notice these great differences, for his imagination, which displaces conscious sensation, is held captive by the vivid representation. 'The mystery of the process, however,' says Sully, 'greatly disappears when it is remembered that what we call a conscious "sensation" is really compounded of a result of sensory stimulation, and a result of central reaction, of a purely passive impression and the mental activity attending to this and classing it. This being so, a sensation may be modified by anything exceptional in the mode of central reaction of the moment.' When we see the eye in a portrait following the spectator as he moves, the trick is due to the painting being a flat projection and not a solid, so that wherever the observer stands it presents the front view of the object represented.

Permanent traces of familiar experiences are left on the mind, and thus a clever draughtsman can with a few rough lines indicate the face of any well-known individual; for the mind of the spectator will, at the slight external suggestion, supply the mental image. At the theatre, if the acting is good, there is a cumulative effect; and towards the end of the play the illusion becomes most marked, for we have come to see what purposes to represent an actual series of events, and by anticipation the mind becomes slightly excited, and emotion is the great disturber of intellectual operations. When two discontinuous stimulations follow each other closely, the effect is that they appear continuous: in conjuring, if the observer is specially asked to note two successive actions separated by a very narrow interval of time, to him it will appear as if they were continuous. From this fact, and from the attention being bribed beforehand by vivid expectation, the eye fails to see the slightest movements which would have given the clue to the performance of the trick.

Healthy mental life is so nearly related to abnormal mental life, that in different ways our slight illusions frequently lead to hallucinations

almost as well marked as those occurring in insanity; but when the mind is normal, by the corrective effect of reflections, the illusions are fugitive; whereas in abnormal states certain false ideas become fixed and persistent by the suspension of judgment and reflection. If we habitually allow our imagination to become overheated, the best of us are liable to illusions; but if we live in a healthy atmosphere, and keep free from mental excitement, we can look upon the occasional failure of the mechanism of the mind as an inseparable accompaniment of its general efficiency.

A PAIR OF GRAYS.

ONE terribly cold winter's morning, Ivan Ivanovitch, Chief of Police, was walking up and down his comfortably furnished office, apparently deep in thought; and not very pleasant thought either, to judge from the dark frown which disfigured his usually handsome face, and the occasionally angry stamp he gave with his foot. It was not often that the suave polite Ivan allowed himself to show any indications that his plans had not turned out to his entire satisfaction. No! he was far too politic for that; otherwise, he would not have stood in the high position he did at present, of chief of police in N—. His income amounting to many thousand roubles a year, possessed of unbounded influence, allied through marriage to some of the first Russian families, respected by his equals, regarded with trembling awe by his inferiors, what more could a man wish for?

But listen! Once during the winter, the Governor of N— was accustomed to hold a grand reception, which was attended by the élite of society, the highest civil and military officials, the foreign diplomatic corps, in short by all the rank and beauty that N— could boast. Up the gaily-decorated sledges would dash over the crisp hard snow, the silver trappings of the horses glittering in the sun, the occupants smiling and nodding as they sat wrapped to their eyes in splendid furs—all smiling and nodding except Ivan Ivanovitch. And yet his sledge was one of the handsomest and most admired; his pair of glossy coal-black horses not to be matched in beauty or swiftness by any of those which they passed so triumphantly on the road. But Ivan knew that presently the sound of other sledge-bells would be heard, their music ringing out in the clear cold air, and the loveliest pair of grays would come dashing by, leaving him, the great man, far behind, and pulling up at the stately entrance, amid general exclamations of wonder and admiration.

This is the vision constantly before his eyes. Why had not fate assigned to him those splendid grays? But fate or no fate, by fair means or foul, those grays he must and would obtain before the next reception, now only one week distant. Never did anything appear more improbable. His rival, a rich land-owner, whose estate lay some miles from the town, had refused all offers, even the most exorbitant prices. Take them by force he could not, by stealth still less. They were known too generally. He was at his wits' end. And so he paced up and down his luxuri-

ously furnished room, revolving in his mind all the different schemes he had thought of during the last few days, only to give them reluctantly up as hopeless and impossible.

The office of the 'Chief of Police' formed part of a huge building situated just outside the town—not a cheerful place to look at; its windows barred with iron; the great heavy doors only opening an instant to swing back, with a dull clang, cruelly suggestive of hopelessness to those within. Even the bright winter's sun, as he shone on strong bolt and bar, regardless of all the terrible misery and despair those walls enclosed, failed to give any appearance of cheerfulness to the place.

But he shone directly into the room where stood, fuming and impatient, the man in whose hands lay the keys of this 'living tomb,' on whose word depended the life and liberty of its inmates, enticing him with its warm rays to look out for a moment on the clear cold day. And indirectly those same warm rays brought liberty and life to one who had despaired of both.

Seconds grew into minutes, minutes into hours, and still Ivan stood by the window, till the darkening twilight warned him that if he did not bestir himself, his last idea, the last chance of attaining his cherished object, would fail him for ever.

The next day the whole population of N— were thrown into a state of wildest terror and confusion, for S—, the notorious burglar, who had only been captured with the greatest difficulty and danger, had somehow managed to effect his escape during the night.

It was a terribly cold night, the thermometer registering many degrees below zero,* the huge icicles—some of them measuring as much as one or two feet long—hanging from the trees, the trees themselves looking like spectres in the black darkness. Not a night for man or beast to be out. So thought at least a man as he trudged steadily on through a dense pine forest, his heavy tread leaving scarcely any impression on the hard snow. He was wrapped in a sheepskin cloak such as is usually worn by the peasants, and his fur cap was pulled well over his ears, almost concealing the upper part of his face. His rough beard and long straggling black hair were encrusted with ice, and over his shoulders, slung on a stout stick, he carried two large stone bottles. Long and patiently had he continued his way, without turning to right or left, without meeting a single human being.

The moon had now risen, her clear cold beams turning that dark forest into a veritable fairyland. Not a bare branch or twig was to be seen; not a breath of wind stirred the deep stillness. The slender pines and massive firs might have been carved out of silver, so stately and motionless they stood, the whole scene peaceful and pure, a strange contrast to the heart of him who passed, the one dark spot in all this loveliness. But at last a distant sound fell upon the silence—the sound of tinkling bells—and a rough wooden sledge drawn by two miserable animals came in sight. It was moving slowly in the same direction as himself, and its occupants, two sturdy stolid-looking peasants, were returning from the market. They at first gazed stupidly and some-

what askance at the stranger, as he begged for a lift by the way, explaining that he wanted to reach a village ten miles off by the morning. The sight of the stone bottles decided them; and they willingly made room, and offered him some share of the coarse sacking with which they were covered.

The stranger laughed, and said he had something better to keep the cold out, at the same time uncorking the bottles and offering one to each of his companions. They contained the strongest kind of spirits, the best 'vodki.' How it burnt in their throats, till they almost seemed on fire inside. No thought of cold now. The stranger kept plying them more and more, urging them to drink where no urging was needed, himself taking care to put the stone bottles now and then to his own lips. Gradually they got emptier and emptier; a drowsy feeling came over the men; the stranger watched them stealthily till they sank back utterly oblivious of all and everything around them. Then he who was watching them slid quickly from the sledge, and hastily but quietly cut through the thick ropes which take the place of harness, and silently disappeared with the submissive animals into the forest.

A few hours later a cry of 'Fire!' was raised on the estate of Count C—. How it originated no one could tell. The 'dvornik' or porter had looked carefully round before turning in for the night. Everything had been in order; the different buildings all safely secured and locked. True, at this season the wood was so dry, the lofts in the roofs so packed with hay, that the slightest spark would be sufficient to ignite them. Some careless servant, perchance, had, while lighting his cigarette, dropped a match, which had smouldered unperceived, till it burst suddenly into flame. The reflection could be seen for miles round. Everything was soon in the wildest confusion; servants hurried hither and thither; the wells were pumped for water—all in vain—every drop was frozen; and the flames unchecked mounted higher and higher. The stables appeared to have caught first, and when discovered, were already one mass of fire. The beautiful occupants, the pride of their master's heart, had perished.

The next day the strictest inquiries were made, but with no result. Simply a piece of carelessness, it seemed, with terribly disastrous consequences. No one dreamed of connecting the complaint of two drunken peasants, that they had been robbed of their wretched animals that same night, with the untimely end of the famous 'grays.' Why should they? There could be no possible connection between the two.

At the Governor's reception that winter, Ivan Ivanovitch, amid general exclamations of admiration and astonishment, smiling and nodding, dashed up in his splendid sledge, drawn by the loveliest pair of grays imaginable. Count C—, who stood at the entrance talking to a high official, turned hastily to his companion. 'Confound it!' said he. 'If I had not seen with my own eyes their very bones lying charred and blackened in the stables, I could have sworn these were my horses alive again.'

S—, the famous burglar, was never recap-

tured. Some say he escaped to America, where he bought land and settled down as a comparatively rich man. How he obtained the means and money remains a profound secret.

REMARKABLE BEDS.

As the Eskimo sleeps on moss and skins, so even wealthy ancient Romans were content to repose on leaves and straw. Ere long they improved on hints taken from conquered nations, filled beds with delicate down, or stuffed them with the finest wool, till they attained the highest pitch of luxury in the appointment of their couches. Richly-carved wooden frames inlaid with ivory or silver, and finally with gold, sustained cushions, pillows, and counterpanes of gold and purple—a striking contrast to the flock-filled trusses of their plebeian brethren. The old Greeks used beds supported on iron frames; while the Egyptians had couches shaped more like easy-chairs with hollow backs and seats.

Climatic considerations must be taken into account by different nations in their bed-making arrangements. The Russian day and night hugs sheepskins round him; and the Pacific islander finds in palm-leaves a sufficient coverlet. In the tropics, mats of grass answer the same purpose. The East Indian unrolls his portable mattress, and in the morning literally takes up his bed and walks off with it. The Chinese use low bedsteads, often well carved; while the Jap, with an uncomfortable wooden rest for his neck, stretches himself on a matting, and has a lighted paper lantern for company.

German beds are furnished with a huge pillow or upper mattress, which answers the purpose of ordinary bed-clothing. Travellers agree that there is not enough of the Continental bed—that, in fact, it ends too quickly.

Europeans living in the East soon become acquainted with the slender iron bedsteads with tall iron rods, designed to support the mosquito curtain which seldom really answers its purpose.

On view in one of the early London Exhibitions was a Chinese bed ornamented with all sorts of curious and elaborate cabinet-work, the greater part of which consisted of inlaid mother-of-pearl. How useless and extravagant ornaments may be heaped upon a single domestic article was proved by the grand bedstead exhibited in the Austrian department. The enormity of its bedposts, of which there appeared to be at least a dozen rising in spires of different heights, with the high relief of the carving, and the massive magnificence of the whole design, and the finish of the carving in all its parts, made this bed appear not unlike a great model of a Gothic cathedral.

Some of our very wealthy American cousins appear to be puzzled in what new form to lavish their money. A brass bedstead inlaid with real pearls was recently made for a lady in New York. On a brass rail which runs across the top the owner's name is wrought in pearls. Still more of a curiosity is the 'Silent Alarum Bedstead, to turn any one out of bed at a given hour,' the production of an inventive genius in London some years ago. This amusing contrivance assumes a degree of density in the sleeper which

no alarm can affect, or else a singular amount of luxurious weakness of purpose. The bed therefore acts the part of Resolution for the sleeper; and having been set overnight for a given hour in the morning, the said incorrigible sleeper finds the bed revolve so as to tilt him out; and a bath being placed by the bedside, he may at once be relieved of all need for summoning a resolution either to get up or take a plunge.

Another remarkable and, we should say, more generally useful bedstead—exhibited in the Workmen's Exhibition at Paris—was made so that it can be taken down and put up again in the short space of half a minute. By a curious combination of springs, the bed can be instantaneously surrounded with curtains, a washstand wheeled inside, and the occupant go through his or her toilet without being seen. By another spring the bed is turned into a canopy suited for invalids, who have no need to stir to perform the transformation.

We are told that M. Thiers died in a little iron bed scarcely larger than a child's, which he had used for fifty years. It was wheeled into the small drawing-room where he had breakfast. He took it with him on his tour through Europe in 1870.

An interesting historical relic will be familiar to all who have visited Holyrood Palace, where may be seen the four-poster bedstead of Scotland's beautiful and luckless Queen, in its faded splendour and melancholy suggestiveness of misfortune and decay.

The darkness and secretiveness of Richard III.'s character had an illustration, strange as it may appear, in the construction of his bed. Among his camp baggage it was his custom to carry a cumbersome wooden bedstead, which he averred was the only couch he could sleep in; but in which he contrived to have a secret receptacle for treasure, so that it was concealed under a weight of timber. Quite a romance could be made out of its subsequent history. After the battle of Bosworth, Richmond's victorious troops pillaged Leicester; but the royal bed was neglected by every plunderer as useless lumber. The owner of the house, afterwards discovering the hoard, became suddenly rich without any visible cause, and became Mayor of Leicester. Years afterwards, his widow, who had been left in great affluence, was murdered by her servant, who had been privy to the affair; and at the trial of this culprit the whole transaction came to light. Concerning this bed a public print of 1830 states that 'about half a century since the relic was purchased by a furniture-dealer, who slept in it for many years and showed it to the curious. It was well preserved, being formed of oak, and having a high polish.'

Many great personages seem to be careful that their importance should be reflected, as it were, in the luxurious appointments of their sleeping apartments. True, it is said that on one occasion when a Persian ambassador was shown into his bedroom in a certain hotel, where a grand canopied state-bed had been prepared for him, he supposed it was a throne in his audience chamber, received his visitors seated on it, and retired to sleep on the carpet in the corner of the room. But Eastern potentates show as a rule a much greater appreciation of costly beds. A remarkable bedstead

was made in Paris for an Indian Prince, who paid thousands of pounds for it. It was constructed partly of silver, with large female figures at each corner, each holding a delicate-looking fan. The weight of the sleeper's body sets certain machinery in motion which causes the figures to keep the fans gently in motion—an ingenious luxury in a hot climate. By touching a spring, a large musical box is made to give forth soft music as a further incentive to slumber. Another bedstead made of silver is said to have been occupied by the German Emperor during his visit to the Sultan. It had Oriental curtains of surpassing richness, heavily embroidered with gold. What a contrast this presents to the simple iron camp beds affected by Prince Bismarck, Moltke, and other renowned leaders!

Among numerous presents sent to a Shah of Persia by one of the Russian Emperors was a bedstead of extraordinary magnificence. It is said to have been entirely made of crystal, and was accessible by steps of the same material all worked in imitation of large diamonds, incrusting in a solid frame. On each side there were spouts made to eject scented water, which by its murmuring invited sleep. It was crowned by a large chandelier, which spread light around, so as to give to the whole the splendid appearance of millions of diamonds reflecting their brilliancy at once. This unique piece of furniture was produced, we are told, at the imperial manufactory of St Petersburg.

In these days, royalty does not seem to concern itself so much about such magnificent sleeping-couches. It is well known that our gracious sovereign always includes a bed among her travelling belongings, which is sent from Windsor Castle whenever Her Majesty goes anywhere. It is said to be a perfectly simple bedstead of maple wood, with plain hangings arranged as a tent, muslin curtains, and a hair mattress. Two beds were manufactured at the Castle works, one of which was placed in the Queen's cabin on board the *Osborne*, and the other sent in advance to the Schloss occupied by Her Majesty in Darmstadt. The royal visitor is said sometimes to leave her bed as a sort of souvenir. One, we are told, is at Dunkeld, and others at Baden and Coburg.

SUMMER'S LATER FLOWERS.

ERE yet the glowing Summer says 'Farewell,'
She leaves a trail of sweet and peaceful light;
In tints subdued she decks the mountain height,
And o'er the woodland weaves a glowing spell.
Oh, faint and few the choristers which tell
June's faded hours of glory and delight!
The faint, sweet airs and tones betoken flight
Of many gladsome gifts, beloved well.

Yet, can a mortal stand unmoved and feel
The laughing hours of bloom and bee go past?
Oh wondrous hour of pathos, solemn, vast!
Let this great aspiration o'er me steal:
'That as my life doth near its close, the last
Faint hours may glow with undiminished zeal!'

OUR CATHEDRAL CLOISTERS.

AFTER viewing a cathedral, mounting to the full height of its topmost tower, perchance descending to its low, dim, short-columned crypt, pacing its aisles and transepts as well as its mighty nave, and the choir with its ambulatories, conning its countless chapels, perusing its monuments, considering its stained glass, and lingering in the galilee last of all, if there be one, there still remains another pleasure in connection with it—a loiter in the Cloister. The fresh air, the green garth, or 'paradise,' as it was often called, in the centre, the open-traceried arcading, the stone-vaulted or open-timbered roof, as the case may be, the wide smooth-paved foot-walks, the vistas they afford—all tend to give these secluded places an ineffable charm.

In old times the cloisters were not so unfrequented as they are now. They served as communications to various parts of the great establishments to which they belonged; and they were used for special purposes. There were many doorways opening into them, not always in similar places in every case, but intended to suit the general convenience in the same way. Often, the doorway to the chapter-house, or of the vestibule giving access to it, was placed in the east walk of the cloisters; that of the parlour was also sometimes there; on the north or south sides, according to their position, another doorway, and in some instances two, opened into the cathedral; the refectory, treasury, and slypes were also frequently entered from the cloisters; and thus there was much coming and going where a footfall is now seldom heard. In one spot was, generally, a lavatory. In front of some of the window-like arches, secluded in compartments or tiny chambers they called 'carrels,' scribes sat at their lifelong tasks of copying the manuscripts that were then the literature of the world, and of occasionally adding to their number by new works. Twenty of these carrels are still to be seen in the south walk of the cloisters at Gloucester. And in the north walk in the same

quadrangle, near the refectory door, is the vast washing-place with a recess for towels. It is claimed for this beautiful cloister that it was the building in which fan-tracery in stonework for vaulting was first used. It is a square quadrangle, and each walk is about a hundred and forty-five feet long, a little more than twelve feet wide, and about eighteen feet high. The east walk has ten large windows, of which nine are divided by mullions into eight lights; and the other three sides have ten six-light windows in each. All of these are now glazed; but it has been thought they may have been unglazed at first, and protection from the weather gained by some other means. It would be difficult to devise a presentment of more elegant and antique sumptuousness in a similar space.

In the cloisters at Durham the lavatory is in the centre of the cloister-garth. It was originally octagonal, with a dovecot on the top of it, and documentary evidence has been preserved that states the stone of which it was built was bought of the abbot of Eggleston-on-the-Tees. The curious work known as the *Rites of Durham* mentions it particularly as a fair laver, or conduit, for the monks to wash their hands and faces at, covered with lead, and all of marble, except the outermost walls, with many little conduits or spouts of brass, and twenty-four cocks of brass round about it; and the same authority mentions there were seven fair windows of stonework in it, and on the top of it a dovecot covered with lead, all of workmanship fine and costly. There were carrels before each arch or window for the north walk; and there was also a receptacle for such books as were in most frequent use.

The dimensions of the quadrangle are about the same as those of the Gloucester example. There is, however, a great difference in the matter of construction; for, instead of the delicate fan-tracery in stonework, timber is used for the roof. There were still older cloisters here than those we now see; but these date from the end of the fourteenth and commencement of the

fifteenth centuries. In the refectory, now used as a library, are all the items that are left of the personality of St Cuthbert, the source of the honours and wealth of the bishopric. In a glass case, as in a glass sarcophagus, are placed his embroidered stole and maniple, with the cross that rested for so many centuries upon his breast.

At Lincoln the gray hoary cloisters are placed between the two transepts on the north side of the choir. They are also roofed with oak, and their rich traceried windows are of fourteenth-century workmanship. One side has suffered grievously from insufficient foundations; and the walls in other places are somewhat out of the perpendicular. At Chester the cloisters are also in picturesque decay. The walls on the north and west sides are Norman. On the east are the chapter-house and its vestibule of thirteenth-century workmanship.

The Worcester cloisters are built on the south side of the nave. These are also of fourteenth-century workmanship with traceried windows of geometric designs. There were, however, Norman cloisters here, as at Durham, before these were erected, for in the south-west corner of the quadrangle is a Norman lavatory. Water was brought to this from Henwick Hill in the neighbourhood down to the days of the Rebellion, when the pipes were used for ammunition. There are three slypes in these cloisters. One of them served also as the parlour, where the brethren might see those with whom they were permitted to converse; another led to the infirmary; another, southwards, to the outer court; and there is a winding stair in the north-west angle which gives access to the library over the south aisle of the nave.

The cloisters at Norwich are on the south side of the nave of the cathedral. They are vaulted with stone, and enriched with sculptured representations of biblical subjects and scenes from the lives of saints. Close to the refectory door in the southern angle of the west walk is the lavatory. In the eastern walk is the door leading to the chapter-house, which is all that has been preserved of that fabric. Only the northern wall, too, of the refectory is left standing, the hand of the spoiler having had free play in this edifice. At Canterbury the cloisters were rebuilt in the fifteenth century, the authorities retaining a few fragments here and there of Norman work and the Norman passage called the Dark Entry. At Exeter they have been partly restored on the south side for the purpose of a library. At Wells the cloisters form three sides of a quadrangle of which the fourth is the whole length of the nave of the cathedral. At Oxford they are well maintained.

Of a different tone are the cloisters of Westminster Abbey. They are not of the soft ashen-gray hue of those of the smiling southern counties, nor of the steely gray of those of the north, but black and white, according as the parts are protected from the soot and rain or exposed to them—absolutely as black and white as an engraving of them. Only those who have turned into their quiet precincts from the rush and roar of the crowded thoroughfares near at hand can realise their peaceful calm and their severe beauty. In a register in which the clerk

of the works recorded facts relating to his duties there is mention of a middle tread in connection with an interment in the cloisters, and thus we learn that these walks were paved with a pathway of squared stones down the centre; whilst, perhaps, the others were placed diagonally to distinguish these more particularly from the rest; and it has been noticed there was also a course of square stones against the walls. This middle tread was a device to keep processions in straight lines; and was also used in the ambulatories in the cathedral, though the large number of interments, with the consequent disturbance of the pavement, had almost obscured it and caused it to be forgotten before recent investigations brought the fact to light.

Of all the incidents that these cloisters have seen few have been more out of the way than the robbery of the king's treasure kept there in 1303, when forty-eight monks as well as the Abbot were sent to the Tower, and some of them kept there for two years. The passing to and fro of William Caxton and his assistant printers when they set up their first press in the Abbey is another departure from the more usual slow-pacing of hooded figures, or grand processions of ecclesiastics in brodered raiment, or swift hurrying backwards and forwards on the occasions of royal ceremonials.

The mention of interments brings to mind that another use is occasionally made of cloisters. At Gloucester there are fragments of incised tombstones in different parts. One near the chapter-house door shows the upper portion of an ecclesiastic with an abbreviated lettering that is understood to represent John de Stanton. In the south walk an arched recess appears to have been made in the walk on purpose to receive another tombstone with a cross incised in it and the letters W. B. And there are few cloisters in which similar memorials are not to be noticed.

There is sometimes a second cloister attached to a cathedral, when one is distinguished from the other as the Bishops' Cloister, or the Vicars' Cloister, or the Little Cloister, or by some other appellation. They are all generally square; but we have examples of an oblong form and of a single straight way, or walk. The diversities in the different buildings surrounding them are thought to have typified the differences that we are assured exist in celestial mansions; the four walls to have represented renunciation of self and the world, and devotion to eternal pursuits and the love of God; the bases of all the columns to have typified Patience; and the whole closed-in square to have suggested Contemplation. Look at them as we may, it is certain they are a delightful legacy left to us all. The Vicars' Cloister at Hereford is especially interesting. It is a hundred and eight feet long, and about eight feet wide. There are a few tablets to the memory of the dead on the inner wall, which is otherwise without break and void. The outer boundary, instead of being a wide open series of arches, as is most frequently the case, is also built of solid masonry up to a certain height, when it is pierced with a row of eight three-light windows, having seven canopied niches between them, supported on brackets. The chief feature is the open-timbered oaken roof, which is richly moulded and very curiously and cunningly

carved on the tie-beams and principal rafters. Each beam has a different subject, such as a wild boar pursuing a squirrel or a bird, or with a saddle on its back; a stag pursued by a dog; swine, fish, foliage; an owl and a mouse; human figures; and an ox with human hands. There is a figure carrying a shield with a different device upon each in the centre of every beam, and the whole forms a vista of open perforated work that is of rare occurrence.

Salisbury cloisters are more superb. The four covered galleries or walks are a hundred and ninety-five feet long and eighteen feet wide; and the green enclosure they surround is about a hundred and forty feet wide each way, and has two cedar trees growing in it. The beautiful arcades are formed by clustered columns placed at certain intervals, on which are raised lofty pointed arches filled in with rich tracery above, and by smaller arches below, which are subdivided again, and ornamented with more tracery. Between each superior arch is a strong buttress projecting into the garth. As in the case of the cathedral close by, all is plain sailing. There are no alterations to explain, no mutilations to deplore. There is one jubilant and serene expression of the utmost perfection possible to the builders of it. We could scarcely take leave of the subject in a more pleasant place.

BLOOD ROYAL.*

CHAPTER IX.—A SUDDEN RESOLVE.
